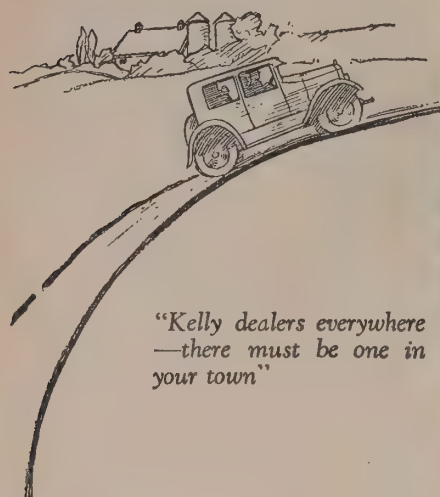
*Estimated as though "Height of Silage" column in Mr. Greene's table is the total height of silage in silo 30 days after filling and before any silage was removed.

The silo measuring table used in making these estimates was constructed some ten years ago as a result of investigations by Professors Eckles, Reed, and Fitch at the Missouri and Kansas Agricultural Experiment Stations. These estimates are more conservative than what have generally been used and were based on actual weights of some twenty-five silos.



The weights given by Mr. Greene show a radical difference and can not be explained on the basis of a lower water or grain content, as this would not make a difference of more than 10 to 15 per cent. The differences in all except two cases are much more than this, and we are unable to offer any reasonable explanation.

The estimates of weight overran the actual weights from 4 to 103 per cent, the average overrun being 23 per cent. In only two out of ten of the cases did the estimates show less weight than was shown by the scales.

We would appreciate reports from others who have had occasion to weigh silage either when put into the silo or when taken out. Give the size of the silo, the depth of the silage, and if possible the condition of the corn when ensiled.

Mr. Greene's report indicates the desirability of further investigation as to the weight of a given quantity of silage. The constant and increasing requests received each year for our silage measuring table and for estimates of weight of silage in silos indicate that there is much more silage bought and sold on measure than one would believe.

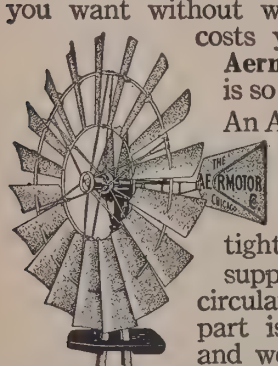
Kellys are built to deliver service

"Kelly dealers everywhere —there must be one in your town"

When you go into a store and put down your money for a tire, what you really are buying is not merely a given amount of rubber and cord but the expectation of a certain number of miles of service.

Whether you get it or not depends upon whether the tire you buy is of a reliable make.

Kelly-Springfield tires always have been built to deliver the kind of service you hope to get. They always *will* be built to deliver that kind of service.



Kellys cost *no more* than other good tires.

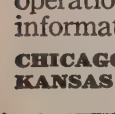
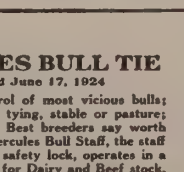
KELLY SPRINGFIELD PNEUMATIC TIRES

RUNNING WATER WITHOUT WORK



With a good Well and a good Windmill you can have all the water you want without work, worry or expense. Water from a well costs you nothing. The cost of an **Auto-Oiled Aermotor** is moderate. The expense for maintenance is so small that it need never be given a thought. An Aermotor runs in the lightest breeze. It will also work safely and steadily in the heavy winds.

The **Auto-Oiled Aermotor** is completely self-oiling. The double gears run in oil in a tightly enclosed gear case which holds a year's supply of oil. When the mill is running the oil circulates through every bearing. Every moving part is constantly and completely oiled. Friction and wear are practically eliminated.



Auto-Oiled Aermotors have behind them a long record of successful operation. Their merits are known the world over. For further information write

Opinions, Brickbats, and Bouque

These columns are open to the readers of Hoard's Dairyman for the expression o their opinion on any subject, whether radical or conservative, destructive or constructiv wise or foolish. It may be cows or crops, religion or politics, or what at the time mos interests you. It may be critical or commendatory, but it should be your opinion. It i your own editorial page but your editorial must not exceed 250 words. Hoard's Dairyma assumes no responsibility for opinions expressed.

A Corn Borer Remedy

HOARD'S DAIRYMAN:—At a farmers' institute, about 25 years ago, the question was discussed how to fight the June bug and grub worms. I suggested it might be a good plan to have a light placed over a tub filled with water; the bugs flying against the light might drop into the water and drown.

The "wise" conductor remarked: "You got a long head on you," to which the whole house joined in a "laugh me out," as the German would say.

Now I will propose the same remedy for the corn borer, running the risk of being "laughed out" once more. Would not the same remedy kill a good number of corn borer moths by having lights placed in the field?

Wisconsin. HENRY A. OCHSNER.

Where is the Gain

HOARD'S DAIRYMAN:—In your editorial, "Blind Condemnation," you take exception to certain resolutions coming before the Land O' Lakes Creameries, Inc., which demanded the same tariff protection enjoyed by the eastern industrialists. I think it is a healthy sign when we find agriculturists even so much as questioning the "sacredness" of protection. Protection is built on the assumption that the producer must be allowed to charge a higher price to the consumer than the article is worth in an open or free market. Neither agriculturists nor industrialists can in any sense of fairness demand that any one of the two enjoy all the protection, but that both shall enjoy the privilege of robbing the consumer.

Let us suppose the impossible is accomplished and a tariff is established that satisfies both of them. Where is the gain when the extra price charged by the producer is paid by the consumer—who composes 100 per cent of both the agriculturists and industrialists? It seems to me our main trouble is that in the desire of both to grab all they can, they have forgotten their own interests as consumers. Protection cannot be made to work except at the enforced expense of the consumer. Agriculturists can not become speculators in land except at the expense of the consumer. When high tariffs and boosted farm land values make the cost of the consumers' living higher than it ought to be, the consumer is compelled to curtail his demand, so I repeat—where is the gain?

Maryland. OLIVER MCKNIGHT.

Want More Milk

HOARD'S DAIRYMAN:—In the May 25 issue of your paper there is an article in the editorial comments entitled "More Milk Wanted." That hits this section as reported.

For the month of February, 1922, the Sheffield Farms Co., Inc., paid the Dairymen's League Association to pooler account for 3% milk $2.42 per cwt. and the League paid back to producers $1.77 per cwt. or a difference of $.65; March following a difference of $.50. This was the last month the Sheffield Farms Co., Inc. purchased through the Pool and March has been considered one of the four months of the surplus season and the principal reason advanced by Mr. Slocum or his associates for not paying more was that they were deluged with a surp

Now, we find five years later a of local shortage and a wes menace from these same promo and they appeal to the Commissio Health for support and appear i rant and forgetful of the fact th low price to producers and a rev ing fund are responsible. The issue of certificates is due this and if there is any virtue i promise, these certificates will to be met annually from this on the League has not been able to other dealers' prices and the c sponding prices for cheese during past five years, considering there no certificates to meet, what pect have producers to encou them to a higher production of and meet a double deduction for tificates.

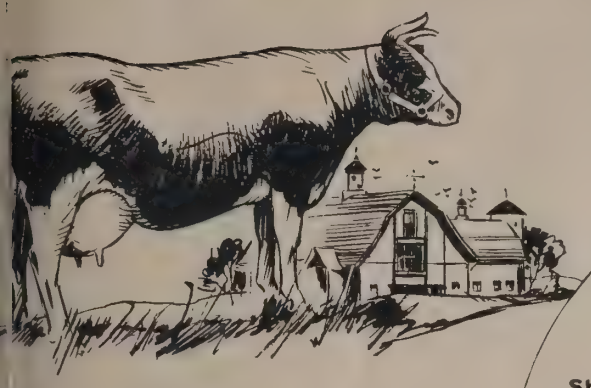
The experience and expense revolving fund in the six states nishing milk for New York City the hardship it works on the producers and all farmers is in i sufficient reason to condemn any of the McNary—Haugen sort or asks for a revolvng fund for pro ers to manipulate with and Pres Coolidge showed a high standar manhood and respect for his oat office when he vetoed the bill an posed such a lottery with the u public funds as the McNary—Ha bill asked for. Farmers are entl to more of the consumer's dollar they get for milk and need money to produce it. But to g is another question.

New York. F. M. JON

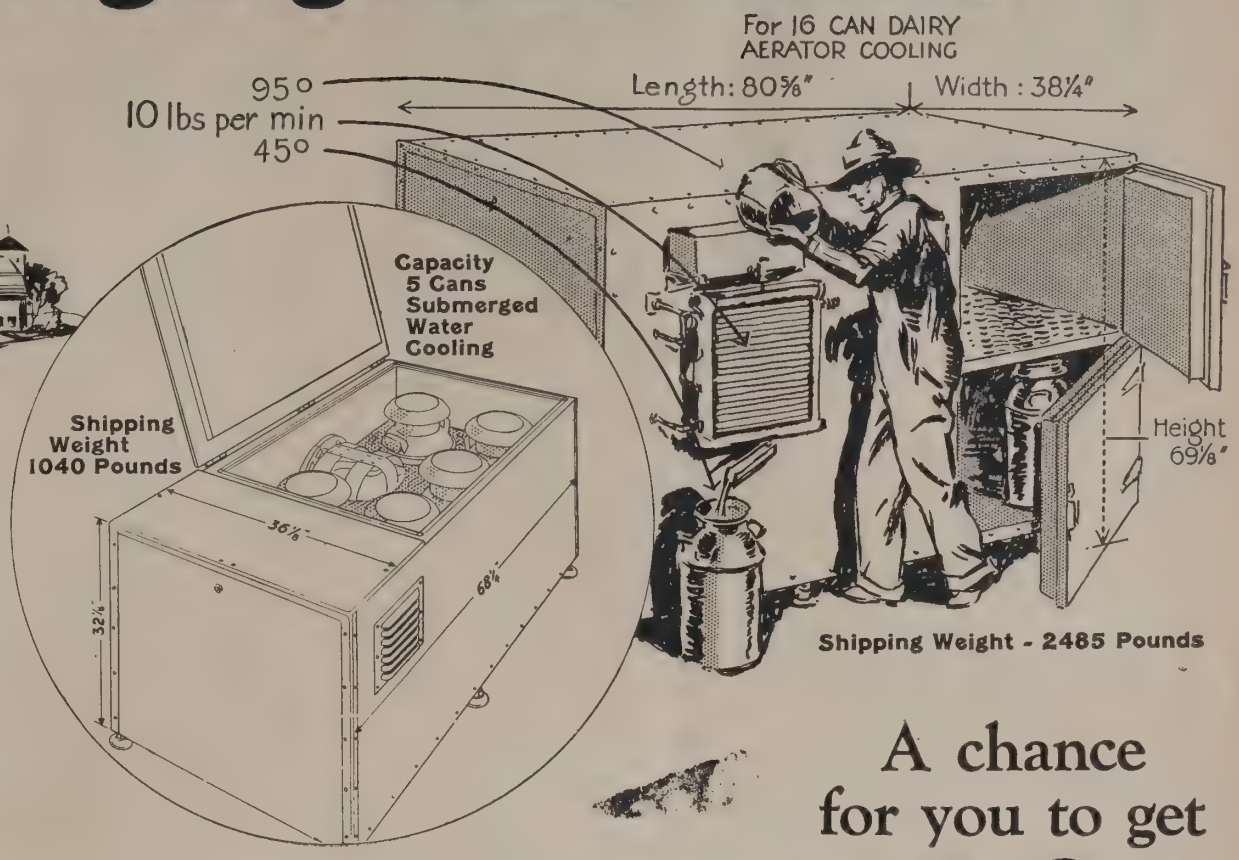
The Farmer Must Hel Himself

HOARD'S DAIRYMAN:—It seem me that your position in referen helping the dairy farmer is s We are making splendid progre organizing co-operatively and i can continue, our industry will l a good basis. Our own organizao now are handling a sufficient qun ty of products to have an influen prices and are fast learning ho keep surplus from depressing p

We need to bear in mind th working out our own destiny w developing ourselves and lea how business is done. It does no peal to me to turn over our prol to some one else to solve. This r be the easy way for the present b it would surely unfit us to cope wi those who are constantly dire their own business.



If we farmers are to retain t freedom we now enjoy we mu willing to do for ourselves. No son develops by watching some o else work; he must work himsel is struggle that develops us an loafing.

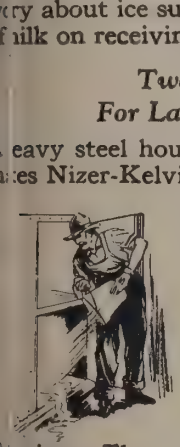


As you have stated, our go ment should enact laws that giv industry an equal opportunity wi all other industries and it shoul ercise care to have the law pro enforced, but I am not ready to a the government run my business

If we can become sufficientl ganized to influence producti would be of benefit to our indu We cannot hope to continue to produce and still receive fair pri for our stuff. We should be in po tion to handle seasonable surpl and to limit production when ces sary.

Minnesota. R. M.

As Important as Pure-breds for High-grade Milk



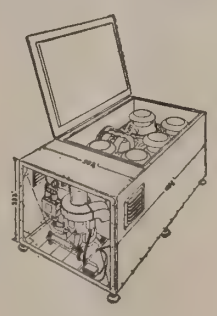
Nizer-Kelvinator Electric Milk Coolers mean as much to you in the production of high-grade milk as pure-bred stock. They bring rich, healthful milk rich and healthful. They check the growth of bacteria—assure a lower bacteria count. They quickly and safely cool milk by electric cold from 98° to below 50° F. And keep it a temperature where bacteria cannot develop up to the moment of shipping.

Nizer-Kelvinator Milk Coolers offer definite day-to-day economies, too. Save all the time and labor of cooling by old-fashioned methods. Save you the cost of ice. No troublesome ice harvesting. No worry about ice supply. No more rejection of milk on receiving station platforms.

Two Sizes and Types For Large and Small Herds

Heavy steel housing with protecting steel bands makes Nizer-Kelvinator Electric Milk Coolers rugged and durable. Strong as a battleship. Lined with galvanized iron. The larger, aerator-type cooler, has removable shelves and flooring of heavy subway grating and adjustable standards which allow easy cleaning underneath. You can flush them out with water.

Two sizes. The aerator type takes care of the output of a 16-can dairy. You can instantly cool eight 10-gallon cans of the night's milking and store it until morning in the storage compartment. In the morning cool the eight morning cans and put it all together to the station—at a temperature below 50°. The smaller is of the submersion type, which will accommodate 5 cans.



For Use With or Without Water

The larger cooler has a 16-tube 18-inch return tubular aerator. Complete cooling by brine, without water, is provided for. Or, if there is plenty of water available, the milk may be precooled at a saving of 40% to 60% in operating costs.

Surprisingly Low Operating Cost

The Nizer Compressors have proved their efficiency for years in ice cream cooling installations. Model I, used with the larger cooler, has a $^{4}/_{10}$-h.p. Universal motor run by 110-volt A.C. or D.C. It has ½-ton ice melting capacity and, on a 5¢ K. W. hour rate, produces cold equivalent to 100 lbs. of ice at a cost of only 10½¢. Model A Compressor, used with the smaller cooler, has ¼-ton ice melting capacity and operates on a ¼-h. p. motor, furnished for 110-volt A.C. or D.C. or for a 32-volt farm lighting system.

Thoroughly Tested and Proved Efficient

The compressors used have proved their worth during years of use in Nizer Electric Ice Cream Cabinets, the most efficient known and the most widely used. And, although Nizer-Kelvinator Electric Milk Coolers were completed more than six months ago, they have been under the most rigid test and examination right on dairy farms up to this time. So trustworthy, durable, efficient and economical have they proved themselves that you can be sure of a satisfactory installation. Saving you money, gaining you money.

Your Milk Dealer Will Help You Get It

In order to give farmers the convenience of direct dealing, through already established contacts, it has been arranged to sell the Electric Milk Coolers to or through Milk Dealers or through most Kelvinator Dealers. Ask one of them about it at once. Or, if you prefer, write direct to the nearest Nizer branch for a complete description.

A chance for you to get $500.00 free for a name

Nizer-Kelvinator will pay $500.00 in gold for an appropriate name. It must be a good name—a real dairy farm name that any dairy farmer would recognize as describing practical electric dairy coolers.

Beautiful Kelvinator for Second Prize

The famous "Sealtite" Cabinet Kelvinator Model 272—gray, steel-clad, white enamel lined, two inches corkboard insulation. Equipped with the oldest domestic electric refrigeration. Just the thing for the farm kitchen. Ample food storage space, light, clean. Gives "cold that keeps" without attention. Sells for $210.00 ordinarily and is the outstanding household value in electric refrigeration today.

Write for a Descriptive Folder

The name you submit will have a better chance if you know all you can about Nizer-Kelvinator Electric Milk Coolers. Send for a folder today. Clip the coupon and send in your name. You can send in as many as you wish. No restrictions except that you are in some way connected with a dairy farm and fill in the coupon.

A fair and square contest, judged by men you know: Harry A. Sieck, General Salesmanager of Nizer and Vice-President of Kelvinator, Inc.; W. A. Schreyer, Business Manager of Dairymen's League News; W. C. D'Arcy, D'Arcy Advertising Company, and Gordon Muir, Advertising Manager of Nizer.

All names must be in the offices of Nizer Division, Electric Refrigeration Corporation, Detroit, Michigan, by noon Monday, August 15th. The names of the winners will be published in this publication by September 15th.

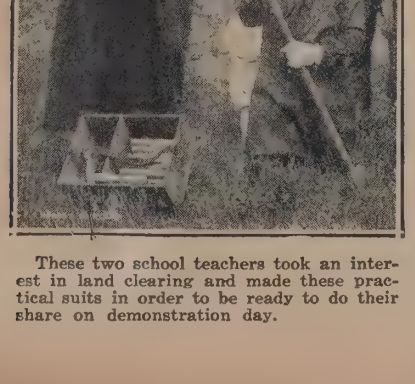
Wearing the Trousers

I'll admit in the beginning that plenty of women exceed the limit in the matter of scanty clothes, but did we ever see the time when women's clothing was, on the whole, such a joy! It's good looking, and it's comfortable, and best of all it's easy to get into.

I laughed the other day at a cartoon I saw in a newspaper. Across the top the man and wife of 25 years ago were shown getting ready to go out for the evening. The man, all dressed, waited for his wife to put the finishing touches to her tight corset-bustle-long skirt costume while she twisted and pulled and gasped for breath. Below were shown the man and wife of today. While he struggled with collar buttons and necktie, she dropped a one-piece dress down over her simple bloomer outfit of underwear, put on her hat, and said, "I'll wait for you in the living room, John," while he glared at her in envious despair.

The simplicity and good looks of women's clothing are things they struggled for decades to attain, but now that we have them I do hope to goodness that we are not going to overdo the thing.

Last summer for a period of weeks I had occasion to be in a city, doing some work in a building which was so located that practically all the tourist visitors to the place passed it. What I saw first made me want to laugh, then weep, and finally to go out and shout something from the house tops about women in trousers. I'm not the fussy sort and I believe in letting people do pretty much as they please without interfering just because they don't happen to suit me, but this time I almost lost my principles and went out campaigning.



In the first place, my conviction is that downtown streets are no place for trousers on women. Secondly, I believe that the feelings of the onlookers should be considered some and if a woman's figure is just too out of joint she should have a heart and stick to skirts; and thirdly, I believe that when women put on trousers and parade with the obvious wish to attract attention they should be asked by somebody—anyone from the chief of police up or down—to fade out of the picture.

Oh, the sights I saw! Two young women on parade in long white sailor trousers, their eyes self-consciously stealing a look here and there to see if they were noticed; a large woman pregnant at least seven or eight months, in khaki knickers, walking defiantly along as much as to say, "I have a perfect right to do this;" a pinched little child-mother in a cheap, soiled trouser outfit, opening her shirt to nurse her baby; weary looking mothers of families going on vacation sight-seeing trips dressed in any sort of knickers and sweaters, desiring only to save work and be comfortable; a few school teachers out for a summer lark, feeling and looking very self-conscious in their new outfits; young girls, straight and slim, at ease, out for a day of fun and freedom in tweeds. For all except these last it would have been a hard job to find anything more unbecoming and, if they would admit it, not really half as comfortable as a good, short skirt with enough pleated fullness to make walking easy.

Only the girl with the boyish figure, straight up and down both front and back, ever need delude herself with the idea that trousers add any charm to her appearance. Thousands have taken to them under the impression that there is something "cute" about them—and there is, but only when on the right person and when in the right place. An evening dress, however lovely, looks silly at a picnic but no more so than do trousers that are worn in the wrong place.

In the old days when women's waists, to be ideal, must be no larger than the span of a man's hand, when skirts were floor length in front and trailed a yard behind, such women as Mrs. Amelia Bloomer—mother of the now-common bloomer—had a real cause but that was 75 years ago. Today the freedom allowed by any dress of good style is such that trousers are not needed for comfort except in a few instances. I don't see how anyone could object to them for horseback riding, for tramping in brushy places, for certain outdoor sports and games, and even for some kinds of work, but how any woman can put them on with the idea of improving her appearance, beats me.

But, then, my last summer's experience may have affected my brain.—LUCY THOMPSON.

These two school teachers took an interest in land clearing and made these practical suits in order to be ready to do their share on demonstration day.

Flies

Old Mother Hubbard
Went to her cupboard
To get her children some food.
No flies were there
It was dusted with care
And all things were wholesome and good.

Every rose has its thorn, they say, and I sometimes think that the biggest thorn of summer is the flies it brings; flies to goad and make the horses nervous, flies to make the gentle old cow kick the bucket over, flies to spoil the noon time nap, and flies to get into the food.

Flies are worse some places than others and an ounce of prevention in their case is surely worth the pound of cure. They are the filthiest possible creatures and love nothing so much as all sorts of dirty places. They will breed in other places but they don't like to and one of the best things you can do if you want to diminish the number of flies around your place is to keep away from your house and barns all accumulation of manure so far as possible.

Professor G. W. Herrick of the State College at Ithaca, New York, says this about flies:

"Flies tend to gather around an outside door that leads directly into a kitchen because of the warm air and odor of cooking food. For this reason it is wise to have a screened-in porch over the back door with a well screened door to the porch. The flies do not gather so thickly about the porch screening and this lessens the possibility of their getting into the house.

"Flies and food are not a safe combination. They breed in filth and they almost invariably carry disease germs with them in their search for food. If breeding places cannot wholly be eliminated the next best thing is to keep the flies from food.

"For those that manage to get past the screens, sticky fly paper is an effective means of destruction. Pyrethrum powder (you can get it at the drug store) sprinkled on door and window sills at night is another trap but it should be swept up and burned early in the morning before any animal or child has a chance to get into it.

"For rooms where there is little food, a weak solution of formaldehyde will attract and kill many flies. A teaspoonful of a forty per cent mixture of this poison in a cupful of milk or water sweetened with a little brown sugar will catch a great many, especially if you put a piece of bread in the saucer. This is poison, however, and great care should be taken about leaving it around."—LUCY THOMPSON.

"My Husband Doesn't Like It"

Don't women just love to get together and tell what their husbands do and don't like! The men would certainly feel flattered and important if they could hear almost any group of women at almost any afternoon gathering.

"My husband simply won't eat anything with nutmeg in it," says Mrs. A. "Why, if I just put in one grain he could tell it," she adds proudly.

"I have an awful time with my husband about new dishes," puts in Mrs. B. quickly, not to be outdone. "Jim always says, 'You can eat the frills, but give me good old meat and potatoes' and I do have such a time trying to make any changes in our meals."

All the other wives, then, tell what their husbands "simply won't eat" and finally they—I feel guilty for I really should be saying "we" all this time instead of trying to pretend that I don't do this, too—finally *we* get around to the subject of salads. It used to end in uniform agreement that no husband would eat any salad but now that constant dripping has worn the stone away a little and food experts have educated us as to the value of salads, we occasionally find a man who will tackle almost any kind and rarely do we find one that doesn't like fruit salad. Men are like children in that they all have a sweet tooth and anything that appeals to this is sure to win them in the end.

Summer is the time for educating people to eat fruit salads for it is then that we can have the greatest variety of them. I almost believe that we need salads more in summer than

OLD SOMERS Brooklyn N. Y.

We are always pleased to receive suggestions in regard to every department of Hoard's Dairyman.

at any other time, too, for their acids, minerals, and vitamins do fit in so well with sizzling, torrid days and heavy, hot nights. People should be taught to eat the lettuce leaf from under the salad for with new knowledge of the food value that is in it, the old idea has disappeared that it is not genteel to eat the lettuce.

Of course, there are endless fruit salads that require buying something from the store but anyone who has a garden or orchard can concoct a salad that is just as wholesome and practically as tasty as if the ingredients were bought. Ripe apples sliced with the skins on on a lettuce leaf, peeled peaches, unpeeled pears—any of these alone or with chopped nuts make a delicious summer salad. My favorite dressing for fruit salad is either sweetened whipped cream or else French dressing made with oil and vinegar shaken up in a bottle with a little salt and sugar.

Cottage cheese makes a good base for summer salads and mixed with bits of pineapple and dressed with whipped cream it is delicious. Another way to use it is to take several of your choice, smooth sweet peppers and stuff them tight with the cottage or cream cheese, chill thoroughly, and then slice. Arrange the slices on a lettuce leaf and serve with French dressing. By the way, if your garden gives out so that you don't have lettuce for a time, you can serve salad very attractively on a large, fresh grape leaf.—LUCY THOMPSON.

How to Fold Them

I was doing my first ironing as a bride when the neighbor whom everybody called "Old Lady M—" dropped in. I don't know just why they did it and I know that as children we were forbidden ever to "old lady" or "old man" anybody, but nevertheless I had grown up on "Old Lady M—." She was the kind who insisted on managing everything for everybody yet I doubt if in her life she ever had a mean thought; she was simply brusque.

I set her down in the kitchen and went on with my ironing, taking special pains now that her eagle eye was on me.

"Don't ever iron napkins that way," she suddenly roared at me. "Hasn't your mother told you that if you iron the creases of a linen napkin down flat they will soon break through? Give me the iron....Now see here, iron your napkin nice and even and then just crease it with your hands....Another thing—when you're doing your big napkins fold them into threes one washing and into fours the next and that way you keep your creases coming in a different place. Oh, you'll know a thing or two," said "Old Lady M—" witheringly, "after you have been married as long as I have."

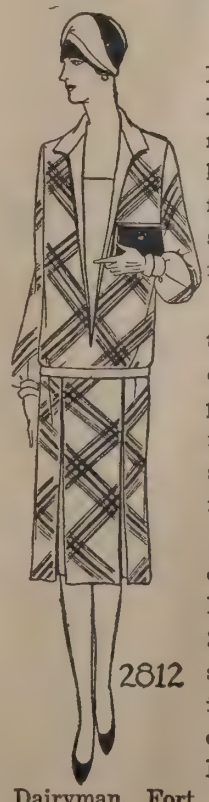
Her ideas were both good and she could probably have told me a good deal more I didn't know about folding clothes. Shirts, for instance, used to be the bane of my life but now I find them as easy to do as the next thing. If you want to be very precise, button them first, then lay them out flat with the buttons down and fold the side seams over to the center back, laying the sleeves lengthwise. Double the bosom back and you have a compact arrangement. Often, however, I do not fold shirts at all but simply put them on hangers in the closet as I always do dresses.

The best way to fold towels and pillow cases is in threes lengthwise; tablecloths are folded in either three or four lengthwise folds—four is easier—and sheets are best done the same way. As to handkerchiefs I never bother putting them into the compact little squares we used to think necessary; two folds make them look just as well and much time is saved.—LUCY THOMPSON.

Cold Pack for Picnic

Keeping milk and butter cold for picnic use and supplying the cake of ice for iced tea or cold drinks has always been a problem for the picnic hostess. She will be delighted with a home-made portable refrigerator suggested by Miss Helen Andres of the National Dairy Council.

This little ice-box is made by lining a firmly woven market basket with asbestos and then with zinc. A wicker cover also lined with asbestos and zinc should fit firmly. If possible, a market basket with a cover in two parts should be secured, as a zinc partition should divide the ice itself from the portion where the butter or other cold foods are kept. If it is necessary to open the side where the foods are the ice will not melt so quickly with the double-topped basket. Such a portable refrigerator could be easily made by a tinsmith if the right kind of basket cannot be purchased.



"Think of the pleasure of having really cold food on a hot day out-of-doors," says Miss Andres. "If one is going on an all-day motor trip with children, the portable refrigerator is particularly convenient for keeping baby's milk."—Household Nutrition.

Hat Boxes

If you are thinking of buying a small piece of hand luggage for a short trip and are undecided as to what it shall be, may I suggest that you at least look at the hat boxes. These useful articles are round with a handle at the side and come in several sizes; they are moderate in price and there seems to be no limit to the amount of clothing they will hold. A friend of mine made a two weeks' trip to New York with nothing more than one of these and carried enough clothing of several visits. The soft, collapsible boxes are not only cheaper but they are lighter and easier to carry though, of course, they will not stand so much wear.

Most of them have in the bottom a sort of hollow dome that may be taken out and packed full and then replaced for a support for the extra hat. Clothing fits around this nicely and if you are not taking an extra hat or are carrying the modern kind that folds or rolls, you can leave this dome out entirely.—LUCY THOMPSON.

Lines That Slenderize

In our SUMMER Fashion Magazine, appear many styles that help to make the figure appear more slender and youthful.

In addition to these are a hundred or more especially suitable for the Miss and some cute styles for children.

Also articles devoted to Beauty, Millinery, etc. Send 10 cents in stamps or silver for your copy, addressing Fashion Dept., Hoard's Dairyman, Fort Atkinson, Wis.

Insure *the* flavor

by using pure, mild

Diamond Crystal

THE fruits and vegetables you "put up" can be as delicious and full of flavor next winter as the day you picked them. They need lose none of their flavor and goodness in the canning.

Simply use Diamond Crystal where your canning recipe calls for salt — immediately you have made certain of the flavor. Diamond Crystal is a pure, mild salt that dissolves quickly and completely, and thoroughly blends with the fruits and vegetables. It brings out all the fine, delightful flavors and makes them more enjoyable to the taste.

Because it is pure and mild, Diamond Crystal will not bleach or toughen the tender skins.

There is a Diamond Crystal Salt for every farm use—for canning, for table and for cooking, for butter and cheese-making, for livestock, for curing meats. Ask for Diamond Crystal at the store where you trade.

"The Salt that's all Salt."

Diamond Crystal Salt

Free!

We should like to send you a generous sample of Diamond Crystal Shaker Salt and the interesting booklet, "101 Uses for Diamond Crystal Salt," without cost or obligation to you.

CYANOGAS

CALCIUM CYANIDE

KILLS FLIES

It's the Gas that kills them

HERE is a material that will keep your dairy barns free of flies at about one-fifth the cost of other methods—and without the necessity of using dusters or other cumbersome equipment.

All you need is an old spoon or piece of cardboard with which to apply the Cyanogas A-Dust. Turn the cattle out of the barn, scatter the dust and then close the barn tightly for two hours. That's all there is to it. Cyanogas gives off a gas that kills the flies. One or two fumigations a week will keep them under control.

Cyanogas A-Dust can also be used for control of house flies in Laboratories, Packing Houses, Feed Stores, Restaurants, etc.

Ask your dealer for Cyanogas A-Dust, or we will send you a five pound tin for $2.50, express collect. This is enough Cyanogas to fumigate an average-sized barn ten times.

Write for leaflet 171 which gives full particulars.

DAIRY MARKET NEWS

The Feed Market Situation

(By Grain, Hay, and Feed Market News Service, U. S. Bureau of Agricultural Economics.)

Feed prices in general made a long expected decline in mid-June although continued strength in coarse grain prices imparted some firmness to feed markets. Bran and shorts declined $.50—$3 a ton for the period but moderate offerings of flour middlings and red dog were readily absorbed and held practically steady at most markets. Eastern demand for the lighter wheat feeds became quiet and trade reports indicated that very little hard winter wheat bran has recently been working to eastern markets. Mills at Buffalo were beginning to press sales of feed and some feed in transit could be bought at slightly less than going quotations. Bran and shorts were generally easier in central western markets while quotations declined markedly in the Northwest. Southwestern markets, however, were relatively firm for bran while prices of shorts showed an advance. Central states feed mixers and nearby jobbers were inquiring for the heavier feeds at Kansas City while red dog was in fair request by southern and Pacific Coast dealers. Mill feed prices were generally easier in the Southeast.

Linseed meal worked lower with wheat feeds, particularly in eastern markets where prices had been well maintained. Production of this feed has not been large but demand recently has become small.

Cottonseed meal quotations were fractionally advanced at some distributing markets, although eastern and central western points report only scattered demand for limited quantities while at Buffalo resellers were unable to make sales even at material discounts under current quotations.

Gluten feed shared in the general market weakness although manufacturers' quotations ruled unchanged. However, it was becoming more easy to secure shipments of this feed from manufacturers and the substantial premiums which had been secured by retailers for immediate shipment were materially reduced. Only limited amounts were available from the manufacturers for immediate shipment but consuming demand for this feed was hardly equal to those offerings.

Hominy feed was also more plentiful but the tendency to declining prices was largely checked by the strength recently displayed by the corn market. Prices declined about $1.25 a ton at Buffalo but held practically steady at central western markets.

Quoted June 23

Standard spring wheat bran: $30.50 at Buffalo, $32.50 at Philadelphia, $28 at Chicago, $25 at Minneapolis. Hard winter wheat bran: $34 at Philadelphia, $26.50 at Omaha, and $26 at Kansas City. Soft winter wheat bran: $32 at Cincinnati, $28.50 at St. Louis, $30.50 at Chicago.

Standard wheat middlings: $32.50 at Buffalo, $35 at Philadelphia, $30.50 at Chicago, $28 at Minneapolis. Soft wheat middlings: $37.50 at Cincinnati, $33.50 at St. Louis. Gray shorts: $32.50 at Omaha, $32.50 at Kansas City.

Cottonseed meal (43%): $45 at Buffalo, $47 at Philadelphia, $42.75 at Cincinnati, $43.25 at Chicago, $41.50 at Kansas City.

Linseed meal (34%): $46.50 at Buffalo, $49 at Cincinnati, $46 at Chicago, $45.50 at Minneapolis, $49.60 at Omaha.

Gluten feed: $39 at Buffalo. White hominy feed: $38.25 at Buffalo, $40.25 at Philadelphia, $37.50 at Chicago. Alfalfa meal: $25.50 at St. Louis, $26 at Chicago, $23.50 at Omaha, $22 at Kansas City.

Butter and Cheese in June

Butter averaged 42.5 cents in New York for the first 25 days of June, a decline of one cent from May. This is 1.3 cents above a year ago and is the same as the June average for 1925. Market reports show more butter going into storage, with receivers reluctant to take heavy purchases at any advance in price.

Cheese prices held steady during the month averaging 22.6 cents on the Wisconsin B... This is slightly above the May average nearly three cents above June of last year and a tenth of a cent higher than two years ago.

For feeding calves

If you know that you can cut milk costs in half by adopting the "minimum milk method," using dry skim milk? Hundreds of dairymen who sell all their whole milk are making this big saving. They simply mix a pound of dry skim milk with a gallon of water, making a money-saving mixture which young calves will thrive on. And they buy a pound of dry skim milk for half or less of what they receive for a gallon of whole milk. (1 gallon whole milk contains 1-pound milk solids.)

AMERICAN DRY MILK INSTITUTE
20 North La Salle Street Room 720-C
CHICAGO, ILLINOIS

FREE Write today for "Better Calves" giving successful feeding methods. State number of calves you feed. We'll tell you where to get dry skim milk.

Mixed—1 pound dry skim milk to 1 gallon of water—is also good for pigs and poultry. It is splendid also for baking.

ANNOUNCING Thompson's MINERAL FEEDS

The Pioneer Mineral Feeds of the Leading Dairy State

A balanced blend of the purest and choicest mineral ingredients obtainable; developed by practical veterinarians, chemists, and feeders to supply the exact elements needed to correct specific weaknesses, aid in assimilation, build bone and blood, and maintain the vigorous health that means livestock profits.

Thompson Minerals have been successfully used for many years. They are easily digested and appetizing; and are sold under a positive guarantee to immediately refund the price if their purchaser is not completely satisfied with results.

100% Pure — NO FILLER!

Experiment Stations Recommend Them. Good Feeders Feed Them

Mineral feeds are most readily assimilated by cattle in summer, when pastures are fresh and green and there is plenty of direct sunshine. Start feeding Thompson's *now* and reap your profits in greater milk flow from your cows and faster gains in feeding cattle.

Dairy, Swine and Poultry Brands, put up in leakproof, fibre-lined sacks and sold by leading dealers at moderate prices. If unable to secure them from your dealer, send us his name. When you are convinced of the remarkable benefits of Thompson Minerals we will see that you are supplied.

Valuable literature on feeding free

A. W. THOMPSON CO.,
Prairie du Chien Wisconsin
The Oldest Wisconsin Manufacturers of Mineral Feeds

☞ This is the first of a series of advertisements telling about the Mineral Feeds it pays to feed. Hoard's Dairyman has been selected as the first medium in which to advertise, because we know that its readers have an intelligent interest in mineral feeding and are in the habit of buying Quality Products.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

National Dairy Show Club Camp at Memphis

Tennessee 4-H club members and leaders will be hosts for the junior department of the National Dairy Exposition at Memphis, October 15—22.

G. L. Herrington, Tennessee State Club Leader, says that the dairy club events will include a cattle judging contest, demonstration contest, showmen's contest, and exhibition of club calves. A total of $3,000 in club premiums is offered in group and individual classes for Holsteins, Jerseys, Guernseys, Ayrshires, and Brown Swiss.

A club camp accommodating 300 members will be held on the exposition ground. A ride down the Mississippi and visits to Delta cotton plantations are program features.

Dairy club activities will be under the supervision of a committee of state club leaders consisting of T. A. Erickson, Minnesota; E. G. Jenkins, Maryland; and G. L. Herrington, Tennessee.

A Junior Makes Money With Cows

HOARD'S DAIRYMAN JUNIORS:—Lawrence Fleming, a student in the Troy High School, Bradford County, Pennsylvania, has demonstrated his ability as a progressive dairyman by making a net profit of $704.04 in one year from his care and management of two pure-bred Holstein cows.

Lawrence selected dairying as his project because, as he explains it, "very early in my life it was my duty to have charge of feeding the Holstein calves on our farm. As I grew older, the calves became splendid cows and the more I worked with them, the better I liked them."

Lawrence tells an interesting story of his work during the first year: On November 15, 1924, he purchased two pure-bred Holstein cows for $200 each. They were due to freshen in November. He made arrangements to buy from his father hay, silage, and straw and to pay for them out of the monthly milk check. Stable rental and other expenses were also charged.

Lawrence followed scientific methods in feeding his cows. Each cow received from 30 to 35 pounds of silage daily, 10 pounds of mixed hay, and one pound of grain to each four pounds of milk. He changed his grain ration several times during the year and no apparent difference was noted in the milk flow due to the change. One ration included the following: 60 pounds oil meal, 100 pounds wheat bran, 200 pounds corn and oats chop, 40 pounds wheat middlings, and 100 pounds gluten meal. The second grain mixture which was fed a portion of the time included 300 pounds gluten meal, 200 pounds hominy, 200 pounds wheat bran, 100 pounds oil meal. The cows were fed and milked twice daily. In no case did they receive more than general farm care.

Lawrence purchased and mixed his own concentrates. The milk was marketed, along with the other milk produced on the farm, through the Dairymen's League Co-operative Association, and Lawrence was credited according to the quantity produced by his cows and the test as reported by the Association.

One of the cows, Dean Segis Alcartra, averaged about 50 pounds of milk per day for the first three months after freshening. Lawrence sold her for $300 at the end of the project. During the time Lawrence owned her, she dropped two bull calves.

The other cow, Gertrude Segis Alcartra DeKol, freshened in December, 1924, with a heifer calf and was soon producing 60 pounds of milk a day. In May, 1925, Lawrence was offered $320 for her, so he made the sale and then rented a cow for $10 per month to complete the project.

Lawrence kept careful records and accounts of his business and found that he had made a labor income of $704.04 during the year from his dairy work. He has invested a part of his earnings in pure-bred Holsteins.

The valuable part of Lawrence's work is not the financial side, however. He is building a foundation for a profitable dairy herd under his own management in the very near future. As he explains it, "the financial profit was not the only gain I made. I now feel quite confident that I can feed and manage dairy cows with at least a fair degree of success."

In speaking of the success of Lawrence's project, L. R. Guillaume, the agricultural supervisor of the Troy school, says: "Lawrence did all the work on his project. In addition he had a 9-acre buckwheat project which was a success. He is one of the best boys to help at home that can be found. His health is not the best but he does not use that as an excuse for neglecting his work."

Pennsylvania. GEORGE F. JOHNSON.

Harmonicas in Club Work

"Several clubs have already discovered that the harmonica offers the simplest and most usable means for bringing instrumental music into the club meetings," reports Lorenzo F. Kinney, Jr., Rhode Island state club leader.

"It is inexpensive, convenient to carry around, and any boy or girl with any interest at all in music can learn to play it."

Harmonica contests were a part of the musical program at Camp ... wards, Kingston, Rhode Island, ... month.

Junior Letters

A State Champion

d's Dairyman Juniors:—Three years hen they got the first bunch of dairy in here, I got a grade Guernsey calf. care of her all summer and in the fall er to the county fair. I did not get a nd, of course, was disappointed. next year I did not take her. That fall d a little heifer calf, and from her aid for herself.

spring I got a pure-bred Guernsey I took the heifer and the cow both to nty fair. The cow, Pansy, took third open class and cow and calf class. premiums amounted to $6.00.

heifer, Topsy of Out Look Hill, took and went to the state fair. Topsy out second down there and the two ms amounted to $14.00.

is on the dairy judging team and the ree highest got a trip to the National Show in Detroit. I was second. I ird in judging Jerseys at Detroit and warded a bronze medal by the American Jersey Cattle Club. The Blue Valley Creamery gave a trip to Detroit for the champion dairy calf club number. I was selected for that so I got two of the same trip.

When I got back, I had another little Guernsey heifer. I am going to let my sister have her to get a start with. My address is Britton, South Dakota.

Ethel Johnson.

Dairying in Missouri

Hoard's Dairyman Juniors:—I live in Lawrence County, in southwestern Missouri. Probably many of you juniors get the idea that we don't have snow and ice this far south, but that is wrong. We have snow quite often, sometimes as early as October and we have some very deep snows. And we have ice, so youngsters in Missouri enjoy skating as well as you do in the North.

EULA HILLHOUSE

I think when I wrote before (1924) I stated that the Carnation Milk Condensery had located at Mt. Vernon. Many changes have taken place since that time. More and better herds of Jerseys and Holsteins have been obtained. The farmers now are using sweet clover for pasture and are growing alfalfa for hay.

When the condensery first opened there were 267 patrons, they now have 1,065. It maintains 42 truck routes.

Lawrence County farms are being rebuilt, 5,500 tons of ground limestone were applied last year. There are three cow testing associations in this county. We belong to one of them.

I believe I told you in my other letter we were milking Jerseys. Well, we still are, we are milking eleven at the present time. I milk four and five night and morning. My address is Verona, Missouri.

Eula M. Hillhouse.

Juniors—Here's Some Record

Hoard's Dairyman Juniors:—April 6, 1926, I joined the Saline County Calf Club. There were 32 members. Each of us wanted a pure-bred Guernsey calf. We all chose bred heifers which made it better but making them cost each of us around $200.

A committee went to Wisconsin and purchased the 32 bred heifers, and had them shipped to this city.

May 6, 1926, was calf club day in Harrisburg, Saline County, Illinois. We drew our calves by lot. I was very lucky and drew a beautiful heifer named Daisy's Bessie, although a sad accident happened. As she and some of the other club members' calves were being trucked out to our farms mine fell out of the truck and dislocated one of her hips. This later caused her to lose her calf.

I was very discouraged at this but still had patience. I still thought as much of her as I did. I took good care of her. I kept her in the barn in the daytime and out in the pasture at night, so the flies would not bother her. During the day when I kept her in the stable I curried and brushed her several times a day. She was very particular and wouldn't drink anything except good, cold well water, and that is what she always got. Every Saturday she never failed to get her weekly bath. I kept her hair fine and her skin thin and loose.

In October, 1926, at the Farmers' Institute, the club members showed their calves. My calf took fourth place with her hip dislocated. They also had an individual judging contest of all the club members and I won second place, and I won second place on my record book.

In January, 1927, the Illinois State Dairymen's Association meeting was held here at Harrisburg. They put on a state wide contest to secure memberships to the association at one dollar each. There were two representing our county. I was one out of the many boys and girls who were chosen and backed by the Harrisburg Kiwanis Club. The boy representing our county was backed by the Rotary Club. It surely was a hot race. We did not know what the other counties were doing but were working for ourselves. There were six prizes. The first prize was a pure-bred heifer calf of any breed and a pure-bred bull as a grand prize. The other five prizes were just a pure-bred heifer calf. Inasmuch as this meeting was to be held here I wanted to send in a winning report. When the contest closed I had secured 531 memberships.

During the meeting the winners were all announced and present. Our county took first and second place. I was winner of first place and received the grand prize. I was very proud that I won and received congratulations from all over the state. Therefore this 51st annual convention was a great success.

I chose Guerseys as the breed I wanted, so I received the male Guernsey during the meeting and received my heifer last month.

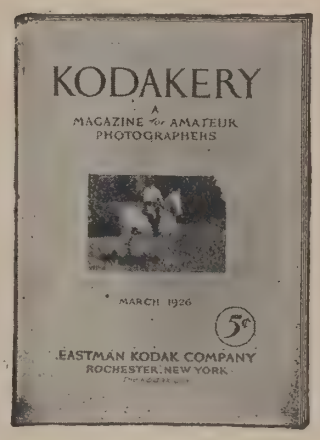
My greatest ambition now is to take the best care of them and develop a wonderful herd.

My address is R. R. 4, Saline Co., Harrisburg, Illinois.

Wanda Ivaline Thomas.

Vacation time is Kodak time!

Attention, Juniors!



You can get this genuine

EASTMAN CAMERA

and twelve issues of the magazine

"KODAKERY"

Free of charge, postpaid

With this fine little camera you can easily make good pictures of all your good times, your family and your friends. You'll have fun making them—and they will be priceless in years to come. Club members will want pictures of their livestock to show development. There's no end of chances for interesting snapshots. And **Kodakery**, with its stories, articles, picture-making hints and profuse illustrations, will help you enjoy your camera to the fullest extent.

Just get three 3-year subscriptions to **Hoard's Dairyman** at $1 each. You can get them easily from your friends and neighbors. Begin **now**—send them to us—and the camera and **Kodakery** for a year are yours.

You need a Vest Pocket Herd Book

Prevent Disease

from cutting down your profits

Use Lewis' Lye. It is the proven method of keeping hogs, cattle and poultry healthy—and that means bigger profits for you.

DAIRYMEN, hograisers, and poultrymen are using Lewis' Lye to keep their herds and flocks free from disease and to make their dairy barns, hog houses, and poultry yards sanitary. Everywhere they report amazing results at extremely low cost. Germs of disease simply can't live where Lewis' Lye is used.

In the famous McLean County System of Hog Sanitation, Lewis' Lye is used exclusively.

And there are hundreds of other uses for Lewis' Lye. Use it for soap-making—it has gained a marvelous reputation for fine quality, economical soap because of its absolute purity. Discriminating soap-makers insist on Lewis' Lye. It makes prize soap at a cost of only a cent a bar.

Use Lewis' Lye in outside toilets to prevent disease and the spread of typhoid fever by flies. To keep drain pipes open use Lewis' Lye once a week.

Lewis' Lye is sold by reliable grocers. If you are unable to secure Lewis' Lye from your neighborhood grocer, send us a postoffice money order for $1.80 and we will send you by express one dozen cans.

In any case, fill out the coupon below and we will send you our book on "Secrets of Soap-Making" giving valuable recipes; also the booklet on Hog Cholera Prevention and a trial package of Pensal—the new cleanser and water softener.

Origin of Breeds of Swine

There are two distinct classes of swine in this country represented by breeds of the lard type and breeds of the bacon type. The lard type hog predominates, but has been modified within the past decade and is beginning to approach what might be termed a meat type hog. The principal lard type breeds are the Duroc-Jersey, Poland-China, Chester White, Berkshire, Hampshire, and Spotted Poland-China. The bacon breeds are represented by the Tamworth and the Yorkshire. The origin of these breeds as given briefly by Russell of the U. S. Bureau of Animal Industry is as follows:

Duroc-Jersey

The Duroc-Jersey breed originated in the northeastern section of the United States. It was derived from mating strains of red hogs developed in sections of New York and New Jersey. Those in New Jersey were originally called Jersey Reds; those in New York are said to have been developed by a man who owned the noted stallion, "Duroc," and people in that vicinity called the red hogs which this man was breeding "Duroc" hogs. Some years after the independent breeding of Durocs and Jersey Reds, these hogs were intermingled in breeding, with the result that there was formed the breed known at the present time as Duroc-Jersey. This breed is red in color, without admixture of any other colors. The popular color is referred to as cherry red; some animals, however, are quite dark, while others are quite light.

Poland-China

The Poland-China hog originated in Butler and Warren Counties, Ohio. This breed undoubtedly was derived from the crossing of several breeds. In the seventies, two farmers—A. C. Moore of Canton, Ohio, and D. M. Magie of Oxford, Ohio—developed a widespread reputation for their hogs and advertised them quite extensively. Their hogs were known at that time, respectively, as the Moore hogs and the Magie hogs. From the Moore and Magie hogs was developed the breed now known as the Poland-China.

Chester White

The Chester White breed had its origin in Chester County, Pennsylvania. The large, coarse hogs found in the eastern states, especially in Pennsylvania, early in the nineteenth century, were a mixture of the Yorkshire, Lincolnshire, and Cheshire hogs, all of which were of English origin. In Pennsylvania these hogs were crossed on smaller-type hogs, but the most successful cross was by using an imported hog from Bedfordshire, England. This crossing was continuously improved up to 1848, when the breed reached such a degree of purity that it could be relied upon to reproduce its desirable qualities. It was named "Chester County White" in 1848, but the word "County" was soon dropped and the present name became established.

Berkshire

The Berkshire is one of the oldest of the improved breeds of swine. It was originated and developed in England and is still raised quite extensively in that country. Many animals of this breed have been imported into the United States and Canada from English herds. Mention is made of the Berkshire hogs in England and Scotland as early as 1789, large specimens being compared with those of other breeds, one animal said to weigh 1,130 pounds and another being still larger.

Hampshire

The Hampshire breed originated in the English county of the same name and was introduced into the United States during the first half of the last century. When the Hampshire hog first began to be popular in the United States it was often referred to as the Thin Rind hog and was classed as a bacon breed. It is now recognized as one of the lard breeds. Hampshires have made rapid progress in popularity during the last 10 or 15 years. Sows of the breed are prolific. The mothers are good sucklers and make good use of grass in pastures.

Spotted Poland-China

The Spotted Poland-China in many ways is very much like the Poland-China, but there is much more white on the body of the former. The appearance is rather that of a black hog with numerous white spots. The standard requirement of the present record associations for the breed is that at least 20 per cent of the body be white. These hogs began to be noticed more during the time when there was a tendency throughout the country to get away from the "hot-blood" Poland-Chinas. The Spotted Poland-China hog, having more length and greater size than the "hot bloods," attracted the attention of farmers who were looking for larger hogs. The first record association of this breed, known as the National Spotted Poland-China Record Association, was organized January 1, 1914.

Tamworth

The Tamworth is one of the oldest and probably one of the purest of all breeds of hogs. There is no evidence of its having been crossed with other modern breeds. On the other hand, there is evidence of pure breeding dating back more than 100 years. The name of the breed is derived from the town of Tamworth, located on the River Tame, in Staffordshire, near the north border of Warwickshire, England. Sir Robert Peel is credited with having introduced these hogs into England from Ireland about 1812, though their real origin is obscure. The first record of any of this breed having been brought to America appears to have been in 1881.

Yorkshire

There are three distinct types of the Yorkshire breed, known as Large, Middle, and Small Yorkshires. ... originated in England, where ... Middle and Small Yorkshires ... known as Middle and Small Whi... The Large Yorkshire greatly ... numbers the others, and is the t... raised by practically all Yorksh... breeders in the United States.

Cost of Producing Pork ... Terms of Feed and Labo...

The cost of producing a gi... amount of live pork under given c... ditions may be easily found by ke... ing a record of the necessary data ... these figures, while interesting, ... likely to be somewhat out of d... shortly after they are completed ... not before. If one knew the appro... mate amount of feed and labor ... quired to produce 100 lbs. of live p... he could easily convert these data ... dollars and thereby determine ... cost of producing live pork at ... time.

Cavert and Pond of the Minnes... Station supply these data from s... records kept on 20 farms in t... state.

On the basis of averages for ... farms it required 457 lbs. of gr... 269 lbs. of skimmilk, 40 days of p... ture, 5 hours of man labor, and ... hour of horse labor to produce ... lbs. of live pork.

The record shows that one far... produced 100 lbs. of live pork f... 308 lbs. of grain, 203 lbs. of skimm... 30 days of pasture, 2½ hours of ... labor, and ¼ hour of horse labor ...

The record further shows that ... farmer required 787 lbs. of grain, ... lbs. of skimmilk, 30 days pastur... hours of man labor, and ¼ hour ... horse labor to produce 100 lbs. of ... pork.

Here we have not only the aver... feed and labor requirements of ... farmers but also for the one who p... duced pork cheapest and for the ... whose costs were very high.

In this survey the factors that ... tributed most to producing p... cheaply were: (1) rations that ... cluded a sufficient amount of mu... and bone building nutrients furnis... by skimmilk, legume pastures, ... tankage; (2) liberal feeding of ... balanced rations; (3) raising a fa... large number of pigs per sow b... (4) an abundance of suitable ... ture; (5) an abundance of clean ... ter available at all times; (6) sel... hogs at moderate weights; (7) gu... ing the health of hogs so as to h... the least possible loss from dise... and parasites; (8) avoiding as fa... possible high priced feeds.

Barrows Versus Gilts

It is commonly thought that ... rows will make more rapid ga... than gilts due to the periodic oestr... of the latter but there is no exp... mental evidence to support this ... tention.

In trials including 601 barrows ... 469 gilts at the Wisconsin Stat... the barrows averaged 1.28 lbs. ... head daily, the gilts averaged ... lbs. It is thought that the fact ... usually selecting from the herd ... number of the better gilts for bre... ing purposes, has had an influe... in leading farmers to believe that ... barrows make considerably more r... id gains. Where all the gilts ... rowed are compared with all th... barrow mates there is no appreci... difference in rate of gain, at le... up to 200—225 lbs. weight.

When we look into the long ave... of the future and see the good th... is for each one of us to do, we rea... after all what a beautiful thing i... to work, and to live to be happy—Stevenson.

Dairymen's League Meets

H. H. LYON, NEW YORK

EW YORK claims one of the largest and most important co-operative enterprises in the ry in its New York Dairymen's ue. It some time ago passed n-year anniversary and under vised form as a marketing co-tive it has passed its fifth year. e last five years in its efforts rketing, as well as during the ous five in bargaining, it has nany of the most serious diffi-s of a co-operative enterprise. no League member would that all serious difficulties are it is now in the strongest and position that it has known. It under these conditions that it in its annual convention the e of June, with some three and attending its sessions, near-third of whom were accredited ates.

haps the outstanding feature of meeting was the presence and address of former Governor en of Illinois. His stress was l largely on co-operation but ought out clearly the disadvan-of overproduction and the dif-es of adjusting production to eeds of the consumer. In addi-e ventured somewhat into a dis-n of a topic with which eastern men have been rather unsym-tic, the plan for stabilizing ts by use of price control and qualization fee. He did this in y diplomatic way and rather d his hearers with him, al-h not probably to a point of ing their support for such bills ve been thus far presented.

sident Slocum reviewed the and showed the healthy growth e organization. He dwelt con-bly on the advantage to dairy-ast and west, both, if our east-airymen put themselves in po-to supply our own local mar-cutting our summer surplus so t to compete considerably with engaged in the production of factured goods and not calling e West for aid during about two hs in the shortage season.

other strong point was in rela-to the saving of what he calcu-to be an eleven million dollar ach year by the maintenance of cate plants with small quantity ed and less than car load ship-s, together with unnecessary ng. A united organization l eliminate these serious losses. "unity" committee is working on this problem and its report at a state wide meeting within about a week has been announced. It is a subject of greatest importance but it was instigated and has been carried on by influences outside the official League group. The measure of the success of this committee has not yet been made and Mr. Slocum made no comment upon it.

The dairy industry of the New York milk shed is of immense importance. It has 1,500,000 cows and supplies milk to fifteen per cent of our entire population, or 13,000,000 people. Of this production of milk the League pools about two and a quarter billion pounds. This organization has improved its handling since 1922 when it put 38 per cent of the milk into class one, while last year it had 61 per cent in that class. The association has become strong enough and is now well enough organized so that it can and does take a hand in helping other agricultural and organization activities. Legislative enactments and administration difficulties in many lines are aided by it. Tariff rates get their attention where affecting agriculture and legal battles of co-operatives are sometimes aided. Railroad freights receive attention, and the establishment of a bureau of statistics for the metropolitan area got its support. It tries to co-operate with other co-operatives in forward looking effort.

Perhaps one of the finest results that has been accomplished is that of bringing the average business man to understand more clearly that it is for his interest to encourage farmers' co-operative effort. That lack of sympathy between business and agriculture is on the decrease, and I believe the same may be said, to some degree, between the groups of dairymen.

The same officers and the same executive committee were reelected for the current year.

A commercial traveler, visiting a large insurance office, boasted to the manager that he could pick out all the married men among the employees. Accordingly he stationed himself at the door, as they returned from dinner, and mentioned all those he believed to be married. In almost every case he was right.

"How do you do it?" asked the manager.

"The married men wipe their feet on the mat; the single ones don't."—Western Christian Advocate.

HOLSTEIN COW, BEAUTY GIRL GERBEN RE-BECKY

The University of Nebraska, North Platte Substation, has a right to be proud of his unusual producer, bred and owned by it. After finishing a 365-day record of 2,173 lbs. milk, 1,106 lbs. fat (1,383 lbs. butter), not long since, she gave birth to win calves and has since completed another good 7-day record—26.29 lbs. fat (35.36 bs. butter.) This is her fifth consecutive 7-day record above 30 lbs. During her last hree lactation periods Beauty Girl has produced 2,902.196 lbs. fat (3,627.87 lbs. utter), an average of 967.4 lbs. fat (1,209 lbs. butter) per year.

Directions For Increasing Your Dairy Profits 10%

Spray your cows morning and evening with Bovinol, using the compressed air type of sprayer in which the oil is forced out by air pressure and is further atomized by an air blast. Every square inch of the hide should be covered. It is best to spray against the direction of the hair, so that Bovinol will penetrate the coat.

BOVINOL
REG U.S PAT OFF

should be applied freely the first two or three times to build up a protective film of oil on the hair. After the first two or three applications a lighter coating may be used.

Follow these directions and you'll make more money from your cows. Agricultural experiments and practical dairy tests have shown that milk production is increased *at least 10%* by the consistent use of Bovinol.

You'll notice a difference immediately in the behavior of your cows. Twitching, tortured animals become quiet and restful when they are sprayed with Bovinol. Flies light on them but they cannot sting. Cows sprayed with Bovinol are able to produce more milk because they are not wasting energy in fighting flies.

Bovinol is not poisonous. It has no taste or odor. It cannot discolor the hair and therefore is ideal for use on show animals.

If you want to increase your dairy profits, spray your cows night and morning with Bovinol.

BOVINOL
REG. U.S. PAT. OFF.

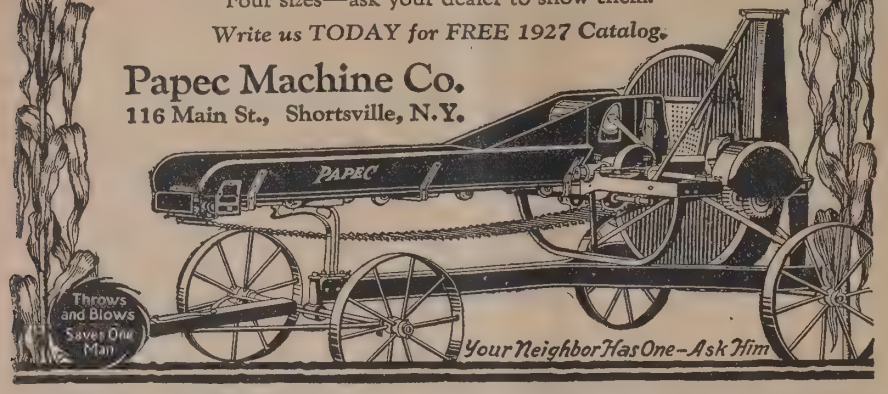
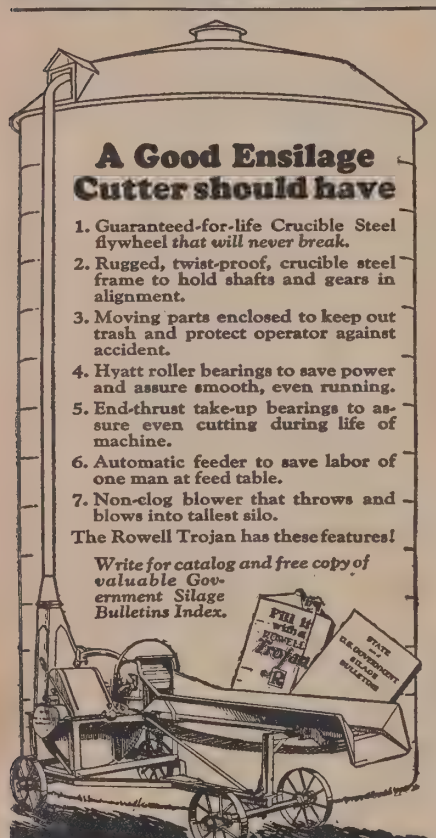
PAPEC "The Cutter That Does Not Clog"



"Quality and Quantity of Cutting"



are the Papec features that most appeal to J. Smith Brundage, Superintendent of the Steuben County (N.Y.) Farms. The Papec cuts ensilage fine and even, so that it will pack firmly. It "eats up corn" as fast as a man can throw it from the wagon. Needs no man at the feeding table, thanks to the Third Roll. Fills the highest silo without stress or strain. Operates at low cost.

Four sizes—ask your dealer to show them.

Write us TODAY for FREE 1927 Catalog.

Papec Machine Co.
116 Main St., Shortsville, N.Y.

A Good Ensilage Cutter should have

1. Guaranteed-for-life Crucible Steel flywheel *that will never break.*
2. Rugged, twist-proof, crucible steel frame to hold shafts and gears in alignment.
3. Moving parts enclosed to keep out trash and protect operator against accident.
4. Hyatt roller bearings to save power and assure smooth, even running.
5. End-thrust take-up bearings to assure even cutting during life of machine.
6. Automatic feeder to save labor of one man at feed table.
7. Non-clog blower that throws and blows into tallest silo.

The Rowell Trojan has these features!

Life and Work of T. L. Haecker

(Continued from page 686)

I do not remember exactly how much she made but know it exceeded the above estimate, approximately 500 lbs.

Later Governor Hoard, Mr. Doyon, and myself bought a number of Jerseys at a Chicago sale, and as we kept a record of the yield of milk of each cow from 1882, I could study the relation of type to production.

Later, Mr. Sedgwick of Lenox, Massachusetts, came to the farm and wanted to send me his herd of Guernseys and divide the offspring, each having half as yearlings. It proved a satisfactory arrangement and broadened my experience. I exhibited both breeds at state fairs and one inter-state fair.

We had a Cottage Grove Grange to which I belonged, and during the time I was expanding my dairy enterprise I became interested in the welfare of the community. The rear of my farm abutted on the direct road from Madison to Milwaukee. From old Cottage Grove Corners a road branched off running southeast. This diagonal road ran in front of our house with the barn across the road. So the rear of the farm was only half a mile from Governor Taylor and where father lived from the time we moved to Wisconsin until we moved to a farm nearer Madison, so I knew everybody in the old neighborhood where I was raised.

The Grange meetings used to be held in the school which was small and inconvenient, so we concluded to build a Grange hall on the rear of my place. Each one helped the best way they could; some would bring lumber, some do carpenter work, some contributed money, and so a fine, two-story, large hall was built without any indebtedness. The neighborhood physician who owned a farm across the way acted as superintendent of construction. Above was a large auditorium; below a dining room with a fully equipped kitchen where we used to meet and have a good ti

I got interested in the Eng Roachdale Co-operative Associati and got a printed copy of their stitution and by-laws, so we had stock or shares—it all belonged to community. We pooled our orders groceries and bought in quan from a wholesale house which

Mr. Uphoff is 76 years old, a lifelo resident of Cottage Grove, and dr W. R. Taylor with horse and buggy Madison for his inauguration as gover of the state of Wisconsin.

longed to a governor under who served as executive clerk for years. We also marketed some of farm products the same way. bought my wagon, harness, and o farm utensils at wholesale. I bo the wagon from the Northwes Manufacturing Co., Fort Atkir Wis., for $50 in which Geo. W. chard had an interest. We organ a co-operative creamery three-fou of a mile from my place, also a munity affair.

The Cottage Grove Co-opera fire insurance was an outstan success from the start. It expa until it embraced a large part Dane County. I was secretary of local Grange and also secretary the county council.

THE STATE CAPITOL AT MADISON WHERE T. L. HAECKER WORKED FOR 17 YEARS AS SECRETARY TO THE GOVERNOR OF WISCONSIN DURING THAT PERIOD BEGINNING WITH TAYLOR AND ENDING WITH HOARD

Oregon Jersey Shows

Jersey breeders in the Willamette Valley in Oregon have for years been known for the exceptionally heavy producing Jerseys they have bred and developed. That section is one that has many enthusiastic Jersey breeders and beginning in 1919 they annually held a series of late spring meetings known as their Jersey Jubilee. In 1925 these meetings were changed to county Jersey cattle shows.

Their series of 1927 shows hel in May in Linn, Polk, Yamhill, Ma and Clackamas Counties were successful and were followed state challenge show at Salem, on May 28 with the first prize ners from the five county shows peting. In addition to several fi Polk County showed the grand c pion bull, La Creole Select's Rod owned by S. H. Robinson.

Such a series of county shows s to us a splendid idea. They sh be both entertaining and educati

Average yield per acre ... 54½ bushels; average cost of ...uction, 39c; average price of ... on Feb. 1 for the 5 years, 37c. ...l net loss over cost of production ... the 5 years was $333.72, or an ...age annual net loss of $66.74.

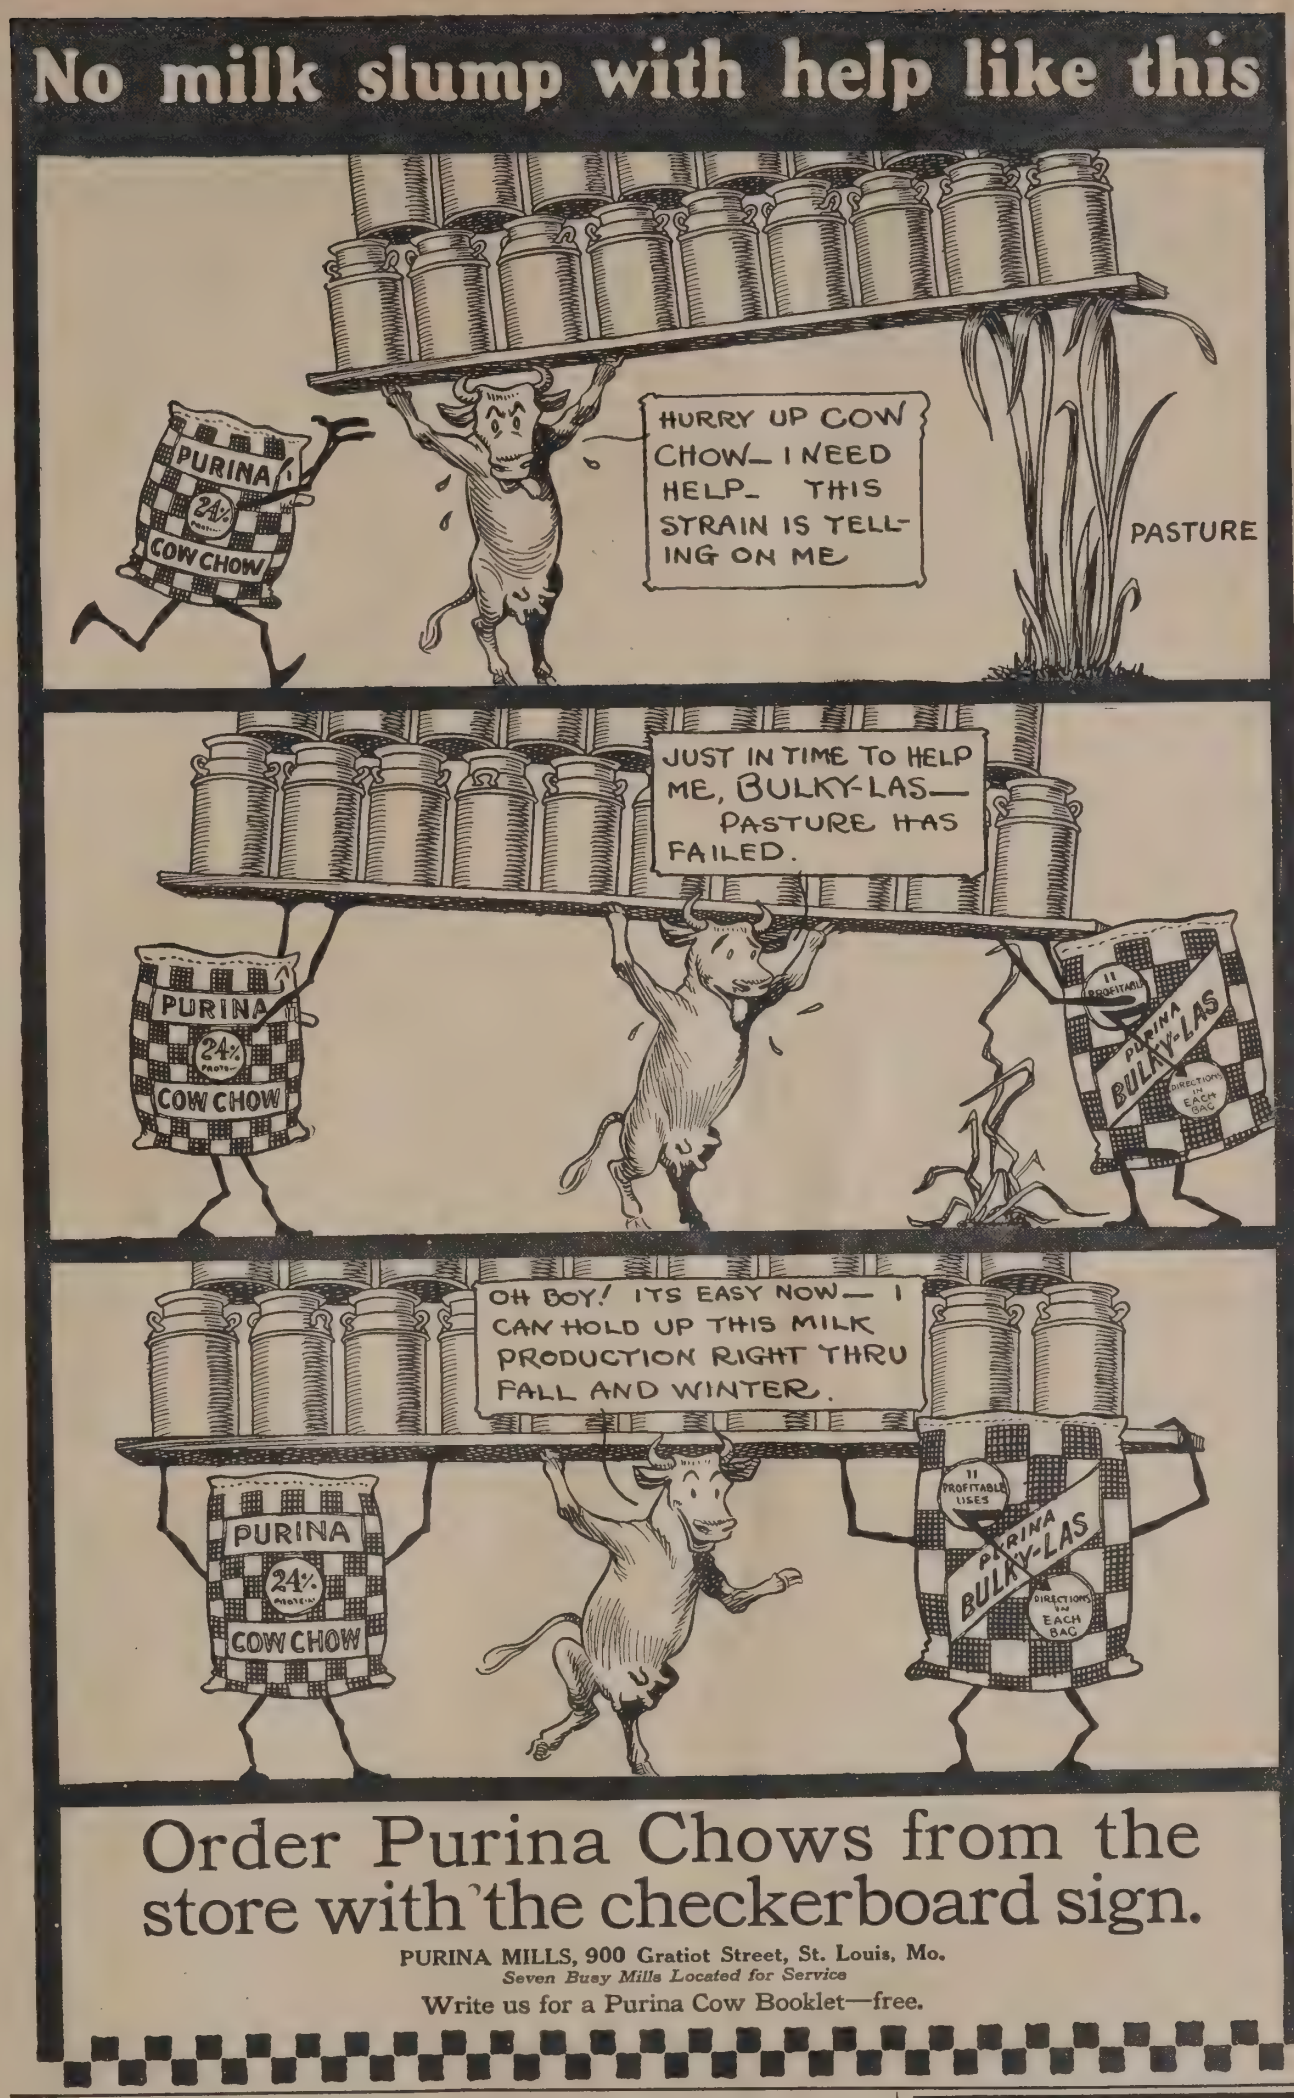
...arley: Barley has been raised ... the last three years and made ...h better showing than oats until ... year when severe drought cut ... yield for a big loss.

...uring the three years 42 acres ...luced 1,297 bushels at a total ... of $895.98. Average yield, 31 ...els per acre; average cost of ...luction, 96c; average price Feb. ...r 3 years, 58c. Total net loss ... cost of production for three ...s was $89.53, or annual net loss ...29.84.

...oy Beans: During the past four ...rs 66 acres of soy beans were ...ed. From 26 of these acres 41 ... of excellent hay were cut. From ... remaining 40 acres 605 bushels ...seed beans were harvested; total ... of raising the 66 acres, ...375.53.

...ome beans were sold for seed but ... majority were fed as protein sup...nent. Figuring the feeding value ...c per pound, the total net profit ...r cost of production for the four ...rs was $169.07, or an annual net ...fit of $42.26.

...lfalfa: Alfalfa hay has been ...ed for the past four years with ...e profits the first two years but ... such good results the last two, ... to very severe drought.



...During the four years a 17-acre ...d produced 127 tons of hay at a ...l cost of $1,633; total net profit ... the four years, $611.68; or an ...ual net return of $152.92.

Farm Business as Unit

...mprovements made to the perma...nt farm equipment and for soil ...provement during the five years ...ounted to $1,376.81. This includ...e a new well, paint and fencing, ...estone, and clover seed. These ...re deducted from the farm income ...fore any profit could be declared. ...Each year I have credited myself ...h an operator's salary of approxi...tely $90 per month on an average. ...is is charged as farm labor the ...ne as hired help. In turn, the ...m is given credit for any com...dities we use therefrom.

...The total net profits on the entire ...terprise for the five years after all ...penses have been deducted are ...472.45. The average annual net ...fit is thus $1,694.49. Since the ...m's personally invested capital is ...out $40,000, this gives us an annu...return on our investment, after we ...ve been paid for our labor, of ...%. You will note that you can...t arrive at this figure by adding ...e profits and losses shown in the ...ceding statements as there are still ...ner accounts to reckon with as pas...re, interest, farm, etc. We have ...ly given the summary of those ac...counts that would be of general interest.

We have not only found the accounts very interesting to us but extremely valuable as a guide in our work. I sincerely believe that with the aid of our accounts and production records we have made more progress in the first five years of our work than we could possibly have made in ten years without them. We make no boasts for our results other than that they show steady progress toward the better. We do not think them extraordinary as we know that they contain the record of possibly as many mistakes as they do of successes; but we do know they help to point out the mistakes and give us proof of the value of the good practices we have discovered and adopted.

"Shure"

Two Irishmen were excavating for a proposed building, when an interested spectator inquired: "How is it, Pat, although you and Mike started work together, he has a bigger pile of dirt than you?"

"Shure," was the quick retort, "he's diggin' a bigger hole."

Position Wanted on large dairy farm by exper young farmer aged 19. Address BOX 417, Hoard's Dairyman.

Position wanted as farm manager or ren equipped dairy farm. Owner furnish everything labor, on percentage. M. C. COLE, Barrington.

Dairy Market News

(Continued from page 703)

May. The Association handled 30,820,710 milk, of which 60 per cent was surplus. spite the largest production in its hi there was a spread of only 25 cents bet the price received from distributors and price paid members. The association asc this because the prices for butter, cheese, condensed milk are bringing more than in comparison to market milk and be it has increased the efficiency with which handling its surplus. The making of milk powder has increased the net pri this product from 17 cents to 40 cents a dred after all costs are considered.

Cream patrons were paid 50 cents a p for butterfat in first grade cream during This is 6 5 cents above the average pri 92-score butter on the New York mark.

Connecticut June Mill

The Connecticut Milk Producers' Associ announces the following prices for Gra milk delivered during June at market centers:

All milk sold in fluid form, 9.5 cents quart for 4 per cent milk, and 4 cents point allowed for other tests; all milk into cream that is sold in fluid form. 2 cents per pound fat above the average mon price of 92-score butter on the Boston ket; all milk made into butter, at a price pound fat equal to the month's averag 92-score butter in Boston.

Sheffield Price

The cash price for May, 1927, paid She producers for three per cent Grade B in the 201—210 mile zone is $2.30 per hun pounds with the usual freight and butt differentials. This is equivalent to $2.50 3.5 milk and is an increase of 10c per dred pounds over May, 1926. —C. W. Hi day, Secretary.

Poultry on the Dairy Farm

Summer Suggestions

idsummer is the slump season. the farm work is rushing, the of eggs is not particularly at- ive, range conditions almost sat- the hens' wants, and they are naturally supposed to lay during season without much care. In all his we lose sight of the fact that ofitable year is a long laying year a correspondingly high produc-

rst, foremost, and all the time we t bear in mind that a complete ra- during the summer is required. tendency toward dropping the mash when range becomes avail- has been the cause of most of the summer production, early molt, resulting low summer profits.

his dry mash mixture cannot be a titute or attempt at disguise. It t be complete which means the tion of animal protein feed from e source. This may be meat scrap, ster tankage, meat and bone meal, t meal, or some form of milk.

n experiment conducted at the Station at Wooster some years showed very clearly that when dry mash was dropped from the on in the late spring there was a in production in about three ks. The hen, apparently, can blish a body reserve while on a plete ration which enables her to inue producing for about that th of time after the dry mash is oved. After this period, the re- e is exhausted and the hen must end upon what the ration carries. his is deficient the production will n proportion.

n the same test a pen kept on a h that was made up in the same of ground grain and by-products, n the exception of animal protein, e the same results as that with no h. If one does not give a complete ture it is unnecessary to grind the ls, since the hen can do that her- and save that part of the bill for

was commonly thought that a h was required. Some Kentucky k showed that when the flock was t on a grain feed and had access nilk and no water, the cost of pro- ing a dozen eggs was just about same as another flock on dry sh.

During the winter, with a flock in finement, with proper control and wed to drink only milk and no wa- this is practical. During the sum- on free range one finds another blem. A hen can only drink a cer- n amount. If part of this liquid is er from pools, pans, troughs, or ks, the milk consumption will be ited in proportion. If a certain per t of the entire feed must be animal tein, for best results one will find t the production will suffer when t amount is decreased.

n mixing a home mash the most monly used and recommended sists of equal parts by weight of und corn, ground oats, wheat n, standard wheat middlings, meat ap, and 1% or 1 lb. to the 100 . of mixture of fine table salt. This be placed in an open hopper and t available for the flock at all nes. With the usual range and an average farm flock it is advisable to cut out the morning grain feed, keep mash before them constantly, and give only the amount of grain required to fill them up as an evening feed.

In this mixture one will find that the animal protein constitutes 20% of the mash mixture or 10% of the entire intake based on a consumption of equal parts by weight of grain and mash.

When milk is available it should be fed since the addition of it to the ration improves results. At the same time about 5—10% of meat scrap or similar product should be added to the dry mash. The addition of it improves both the palatability of the mash and production.

Broody Hens

Everyone these days likes to refer to the "good old days." Back in that time we can remember all of the devices by which broody hens were "broken up." That statement was true in that they were broken up so that they never did come back as good producers after 24 hours in a tub of water, a few days without feed, hung up in a gunny sack, or maltreated in some other way. Any idea of production they ever did have was gone after such treatment.

Every broody hen should be collected every night just as religiously as one collects the eggs. At this time she should be given either a colored celluloid leg band, a hog ring, or some other identification.

The hens should be placed in some shady, protected place in a slat bottomed coop on regular ration. They should have constant access to dry mash and all other materials. When kept on a good ration and collected as soon as broody, there will be less yolk absorption and consequently a shorter resting period before again starting production. A broody period should not require a rest of more than a week or ten days.

When making the first cull all of those hens that are well marked as a result of several broody periods should go to market. There is undoubtedly a close connection between broodiness and production. If the average production of the heavier breeds were raised there would be no more broodiness than there is in the Leghorns. Production and not name controls broody tendencies. Some of the most persistent sitters were White Leghorns. Along in midsummer one gets the idea that the entire flock is broody. In most instances just a few hens that are broody time after time give the entire flock a bad reputation.

Summer Eggs

About June 1 there is usually a National Swat the Rooster Week. The necessity for removing the males is evident. Eggs from flocks without males will never develop into rots. In this, as in most other "Weeks," it is necessary to use judgment. If one has just an ordinary bunch of males it is advisable to dispose of them and buy a better grade the following year.

When one has a bunch of males from real producing lines or are pedigrees, they should not be sold. They can be carried on a separate range away from the rest of the flock, with a wire covered front to the house and hopper fed to reduce labor. The production of infertile eggs is especially advised when one caters to a fancy market.

Egg collections can be helped by keeping the flock confined to the house until noon or shortly after. This will discourage stealing nests in the mow, machine shed, tall weeds, or other isolated spots. With good ventilation the house will be about as satisfactory as an outdoor range with practically no additional labor. Under farm conditions, this plan is followed in a great many instances.

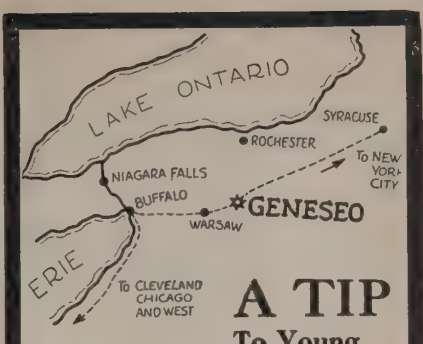
An infertile egg cannot rot, but evaporation can take place. Regular collections, with the eggs held for marketing in a cool place, will prevent a lower classification from this cause.

Confining the flock for a few days after heavy rains will also result in an improved appearance to the egg. Some litter on the floor even during the summer will allow the hens to keep their feet cleaner and produce a better appearing egg.

Some of these things may seem trivial, but they all count up as a part, and oftentimes an important part, of the activities for the year.—J. B. HAYES.

Effect of Sunlight on Growing Chicks

Nine lots of chicks were selected for studying the effect of exposure to sunlight and supplementing the ration with crude and refined cod liver oil at the Canada Experiment Farms. The birds not being exposed to sunlight were in pens having the windows covered with heavy brown paper and light was supplied by electricity. The results showed that the highest mortality occurred in the pens having no sunlight, while the mortality was lowest in those having direct access to sunlight. The former group, however, made the greatest percentage gains in weights.



World's Poultry Congress

A treat is in store for those who attend the World's Poultry Congress to be held at Ottawa, Ontario, Canada, July 27 to August 4, 1927. The program of lectures and addresses is the most comprehensive one ever given by the poultry industry of the world and presents a unique opportunity for producers, distributors, and consumers to learn a great deal about practically every phase of the poultry industry.

"Waiter! Take this egg away!" roared the elderly diner. "Take it away."

"Yes, sir," said the waiter, as he glanced wistfully at the offending article. "And—and what shall I do with it, sir?"

"Do with it?" the outraged customer rose menacingly from his chair. "Do with it?" he bellowed, fiercely. "Why, wring its neck."—White Mule.

Dr. Hess Fly Chaser

makes cows milkable

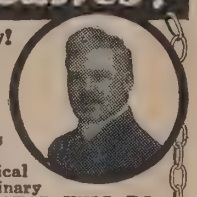
They relax. They let down. You get the last drop. It is long lasting.

Dr. Hess Fly Chaser has the odor of the pines. Because of this odor it serves a threefold purpose:

First—It is the most effective fly and mosquito repellent known to science—quick in action, long lasting.

Second—It is an excellent disinfectant. Therefore, while it is keeping the flies away, it is also destroying the disease germs that attack your cow's body—disinfecting your barns, and injecting into the atmosphere a most healthful odor.

Third—No herd sprayed with Dr. Hess Fly Chaser ever suffers from warbles, which cause a great annual loss to dairymen and farmers.



It does not blister—does not stain the hair—does not taint milk. Applied to the hands and face, it keeps the mosquitoes away.

If Dr. Hess Fly Chaser does not prevent the milk slump, make your cows milkable in fly-time, save your horse-flesh all summer long, it will not cost you one cent.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Sudden Blindness

It sometimes happens that a farm animal suddenly becomes blind, although the eyes appear to be even "brighter" than normal and the owner is at a loss to account for the trouble. He is acquainted with the symptoms of "pink eye" which, he knows, cause the eyeball to bulge from its socket and take on an opaque or porcelain appearance; but in the case to which we refer there is no cloudiness or discoloration of the eye and the animal does not appear to be sick or "fevered." In other instances the report comes to us that a calf or foal is born blind, yet its eyes appear to be "all right." The cause of this form of blindness always is a puzzle and we are asked if there is a chance of recovery.

The disease in these cases technically is called amaurosis or, popularly, "palsy of the sight." It is a paralysis of the retina of the eye and the optic nerve and that usually proves incurable. In the horse it is also called "glass eye," which should not be confused with "watch eye" or "wall eye" in which the sight is unimpaired but coloring or pigmentation absent. The eyes, when affected with amaurosis, appear usually brilliant and open. That is due to the fact that the pupil is widely dilated and permanently so, for there is no power of contraction of the pupil. The animal is "stone blind."

This disease of the eye suddenly may be caused by a blow on the head, or fracture of a bone over the eye so that pressure, or injury, of the nerve is caused. It may also result from loss of blood following castration, dehorning, or some other wound, or when "flooding" occurs after calving. Any severe shock possibly may cause it, or it may result from debility of the system following an attack of any serious disease. It has been known to result from lightning shock. Another peculiarity of the disease or condition is that it may affect an animal at birth, without apparent cause; but in these cases it is to be suspected that bruising, during passage of the head through the pelvic opening, may be the cause.

Recovery may, in time, occur in those cases of amaurosis that are caused by loss of blood, or debility following an attack of disease. Treatment, in such cases, consists in administration of tonics, such as iron sulphate, nux vomica, and gentian, under direction of the veterinarian and along with generous feeding. When it has been caused by a blow on the head, application of soothing remedies, at first, and of a blister eventually, may possibly do some good; but the disease, as a rule, proves incurable. It may be spontaneously recovered from when present at birth, but that is rare.

Fouls

My cows get sore or split in hoof up next to hair. Gets odor. I disinfect barn and gutter with crude carbolic acid. I have lived on this farm 3 years. The cows got it the first year and have been bothered ever since.
St. Elmo, Ill. J. P. C.

The cows are affected with "fouls" or "foul in-the-foot," sometimes called "foot rot." It is caused by foreign matters such as grit, bits of corn cobs and manure, etc., lodging between the toes and lacerating the fine skin. Standing in mud, wet, and filth in the yard or stable is an inducing cause. Do away with all such conditions. Keep the cows in a clean

Pipe Smoker Te of Risking Life Finding His Ca of Favorite Tobac

Rescued from dangerous c in Virginia he goes back find can of tobacco he dropp on the way out

Over a period of years, we heard of many ways in which smokers prove their devotion to favorite tobacco.

But the medal certainly goe Joseph P. Fink of Darby, Pa., wh the risk of his life went back int very cave from which he had been rescued, to find the can of E worth that he had dropped s where in the darkness.

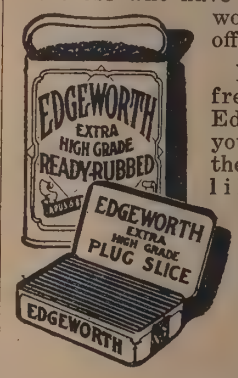
His letter follows:

Darby, Pa.
November 12, 19

Larus & Bro. Co.
Richmond, Va.
Gentlemen:

I take the liberty of writing yo concerning a little incident that ha pened to me in the Shenandoah Va ley of Virginia.

I have a mania for crawlin through a number of unexplored ca erns between the towns of Woodsto and Mt. Jackson. One cave was e ceedingly dangerous with its tig passages, etc. I spent three hours i this cavity, groping blindly with "dead" flashlight and a severed gui ing string.



To cut my story short, I was final rescued by a searching party after terrible experience. It was a wonde ful feeling as I sat at the mouth the cavern telling my friends that would not go back in there for lo nor money. I meant it—until reached for my can of Edgeworth. was gone, and I recalled droppin something during the excitement i the cave.

It is queer what a man will when his favorite tobacco is co cerned. I realized that without my t bacco it would be as bad as being lo in the cavity—so I crawled back.

It was a grand and glorious feelin as my hand came in contact with t Aristocrat of Tobacco.

Yours very truly,
(signed) Joseph P. Fink, Jr.

To those who have never tried E worth we make h offer:

Let us send free sample: Edgeworth so you may put i the pipe test. If like the same you'll like Ed worth wher and whene you buy it, f never change quality.

Write y name and a dress to Larus & Brother Compa 15 S. 21st Street, Richmond, Va.

We'll be grateful for the name address of your tobacco dealer, if you care to add them.

Edgeworth is sold in various s to suit the needs and means of purchasers. Both Edgeworth Slice and Edgeworth Ready-Rub are packed in small, pocket-size p ages, in handsome humidors hol a pound, and also in several handy between sizes.

To Retail Tobacco Merchants: your jobber cannot supply you Edgeworth, Larus & Brother C pany will gladly send you prepaid parcel post a one- or two-dozen ton of any size of Edgeworth Slice or Edgeworth Ready-Rubbed the same price you would pay jobber.

H. S. HAGER, PRAIRIE DU SAC, WIS.

Golden Sunset Jersey Bulls

Young bulls and bull calves very reasonably priced. Blue Belle, Golden Rosebay, Eminent, Flying Fox, Gamboge and Hood Farm breeding. Herd established 1899. Free circular.
THE ENNIS STOCK AND DAIRY FARM, Festus, Missouri

Robertson Jersey Sale

The dispersion of the R. D. Robertson Jersey herd in Barron County, Wisconsin, recently was strictly a farm sale. It had been advertised only locally, and by no means all of the cattle were in sale condition, particularly the younger heifers. The entire 40 head of all ages averaged $108, the price on the pure-breds being below that for the grades. Seventeen registered animals, four of them heifer calves, averaged $103.50.
Wisconsin. G. W. VERGERONT.

A Tree

I think that I shall never see
A poem as lovely as a tree.

A tree whose hungry mouth is prest
Against the earth's sweet flowing breast.

A tree that looks at God all day
And lifts her leafy arms to pray.

A tree that may in summer wear
A nest of robins in her hair.

Upon whose bosom snow has lain;
Who intimately lives with rain.

Poems are made by fools like me
But only God can make a tree.
—JOYCE KILMER.

BROWN SWISS

Brown Swiss Bulls Mark Imprint on Grade Herds

Extra large production in a herd of grade cows may be gained by breeding with a Brown Swiss bull. They sire strong calves of a uniform type, well adapted for the general dairy farm. Mature bulls weigh between 1,800 and 2,500 lbs.

We will be glad to help you secure a Brown Swiss bull and, if you desire, a heifer or a cow.

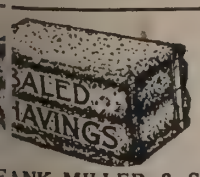
Michigan Plans Big Dairy Days

The Michigan State College, Michigan State Department of Agriculture, and the Michigan State Holstein Association are co-operating in a series of dairy meetings to be held as follows: Tuesday, July 26, Pontiac State Hospital, Pontiac; Wednesday, July 27, Kalamazoo State Hospital, Kalamazoo; Thursday, July 28, morning, Michigan Reformatory, Ionia; afternoon, Ionia State Hospital, Ionia; Friday, July 29, Traverse City State Hospital, Traverse City.

The program will be similar at each meeting, starting at 10:00 a. m. with a dairy judging demonstration by Professor J. E. Burnett of Michigan State College. At noon there will be a basket picnic with free ice cream and lemonade.

At 1:30 p. m. each day there will be short talks by Professor R. S. Shaw and Professor O. E. Reed of Michigan State College, E. J. Cooper of the Holstein-Friesian Association of America, and D. D. Aitken, ex-president Holstein-Friesian Association of America.—J. G. HAYS, Secretary.

Free to Calf Raisers



If you sell all your whole milk, write today for our new free pamphlet. It tells how you can raise heifer calves from your best cows with greatest success and least cost. Explains feeding practice as endorsed by the U. S. Department of Agriculture and state animal husbandry authorities. Learn of the profits offered by the "minimum milk method." Simply ask for Bulletin 301, stating number of calves you feed.

Write today to Room 716, 160 N. La Salle St., Chicago, Ill.

WHITE COLLIES For Sale!

COMPLETE DISPERSAL AT AUCTION!

Of the Famous MINNESOTA HOLSTEIN COMPANY HERD

"America's Premier Type and Production Herd"

No herd in the world has a greater record of achievement for show ring winnings and production than the Minnesota Holstein Company herd. This herd has produced many sensational record cows, including the U. S. Champion butter producer. Three different times since 1920 the herd has won the Premier Breeder banner at the National Dairy Show. It has won three firsts at the National on "Get of Sire" and twice won 1st and 2d, an unequalled accomplishment. The herd has won a total of 27 First Prizes at the National in the past 7 years and has won 6 All-American honors, a record unexcelled by any other breeder. The present herd is even greater than it has been in the past and is in prime breeding condition. Only three cows in the entire lot are over 7 years of age. A healthy herd that has not had a reactor for over 3 years.

ALL SELLING!

MAY WALKER OLLIE HOMESTEAD
The U. S. Champion butter producer with 1523.23 lbs. butter from 31,610 lbs. milk. The only cow with three All-American offspring. A son, a daughter and several granddaughters also selling.

MAY WALKER INKA SEGIS
All-American Senior Yearling 1926. Has 23.44 lbs. as a junior two and is completing sensational year record. A daughter of the cow above. Full sister to Sir Inka May.

MISS LASSIE ORMSBY
First prize 2-year-old at Minnesota last fall. Will be a sensational 3-year-old this fall. She made 22 lbs. in seven days with first calf and is completing splendid year record.

STAR WALKER INKA SEGIS
A 21-lb. junior 2-year-old with 857 lbs. for the year. By a son of May Walker Ollie Homestead. Her dam was a first at the National and also the former world's champion 305-day heifer.

PHOEBE CORNUCOPIA WAYNE
An 4125-lb. cow with 1008 lbs. in the ten-month division. A wonderful individual. Two splendid sons by Sir Inka May also selling. Their two nearest dams average 1324 pounds.

75 HEAD

PIEBES — INKAS — ORMSBYS

—THE HIGHEST RECORD COW in the U. S. over all ages and breeds.

—MANY OTHER GREAT PRODUCERS including 2-year-old heifers with 800- and 900-lb. records and cows over 1000 lbs.

—DAUGHTERS OF COWS with records up to 1523 lbs. and many from 800- and 900-lb. 2-year-olds.

—MANY WONDERFUL SHOW ANIMALS including National Dairy Show firsts and All-American winners.

—A DAUGHTER and many granddaughters of May Walker Ollie Homestead, the U. S. Champion butter cow.

—A SON OF THE U. S. Champion and several grandsons. Several from 1000-lb. cows.

Positively a Complete Dispersal

The sale is being held to dissolve the ownership of the herd which is owned by Mr. A. L. Eberhart of Chicago, and Mr. V. S. Culver of Austin. Every animal will be sold without protection of any sort.

Do You Need a Bull That *Will* Put Straight Toplines on Your Herd?

EAR TAG 1175
Born November 3, 1926

It usually takes something more than a straight bull to transmit straight toplines. It takes a straight bull with a straight sire and dam and straight ancestry.

A bull with the right sort of a topline out of a family noted for such toplines will do wonders for any herd, but such bulls are hard to find.

The bull pictured above is such a bull. His sire, his dam, his dam's sister and his two grandams are the straightest topped animals you could ask for.

DANDRUFF IS INEXCUSABLE—

And now it is avoidable

PUT it up to yourself: could you honestly be attracted for any length of time to a person who had a case of loose dandruff?

This all too common condition is humiliating to the victim, and disgusting to everyone. The pity of it is that often many suffer needlessly.

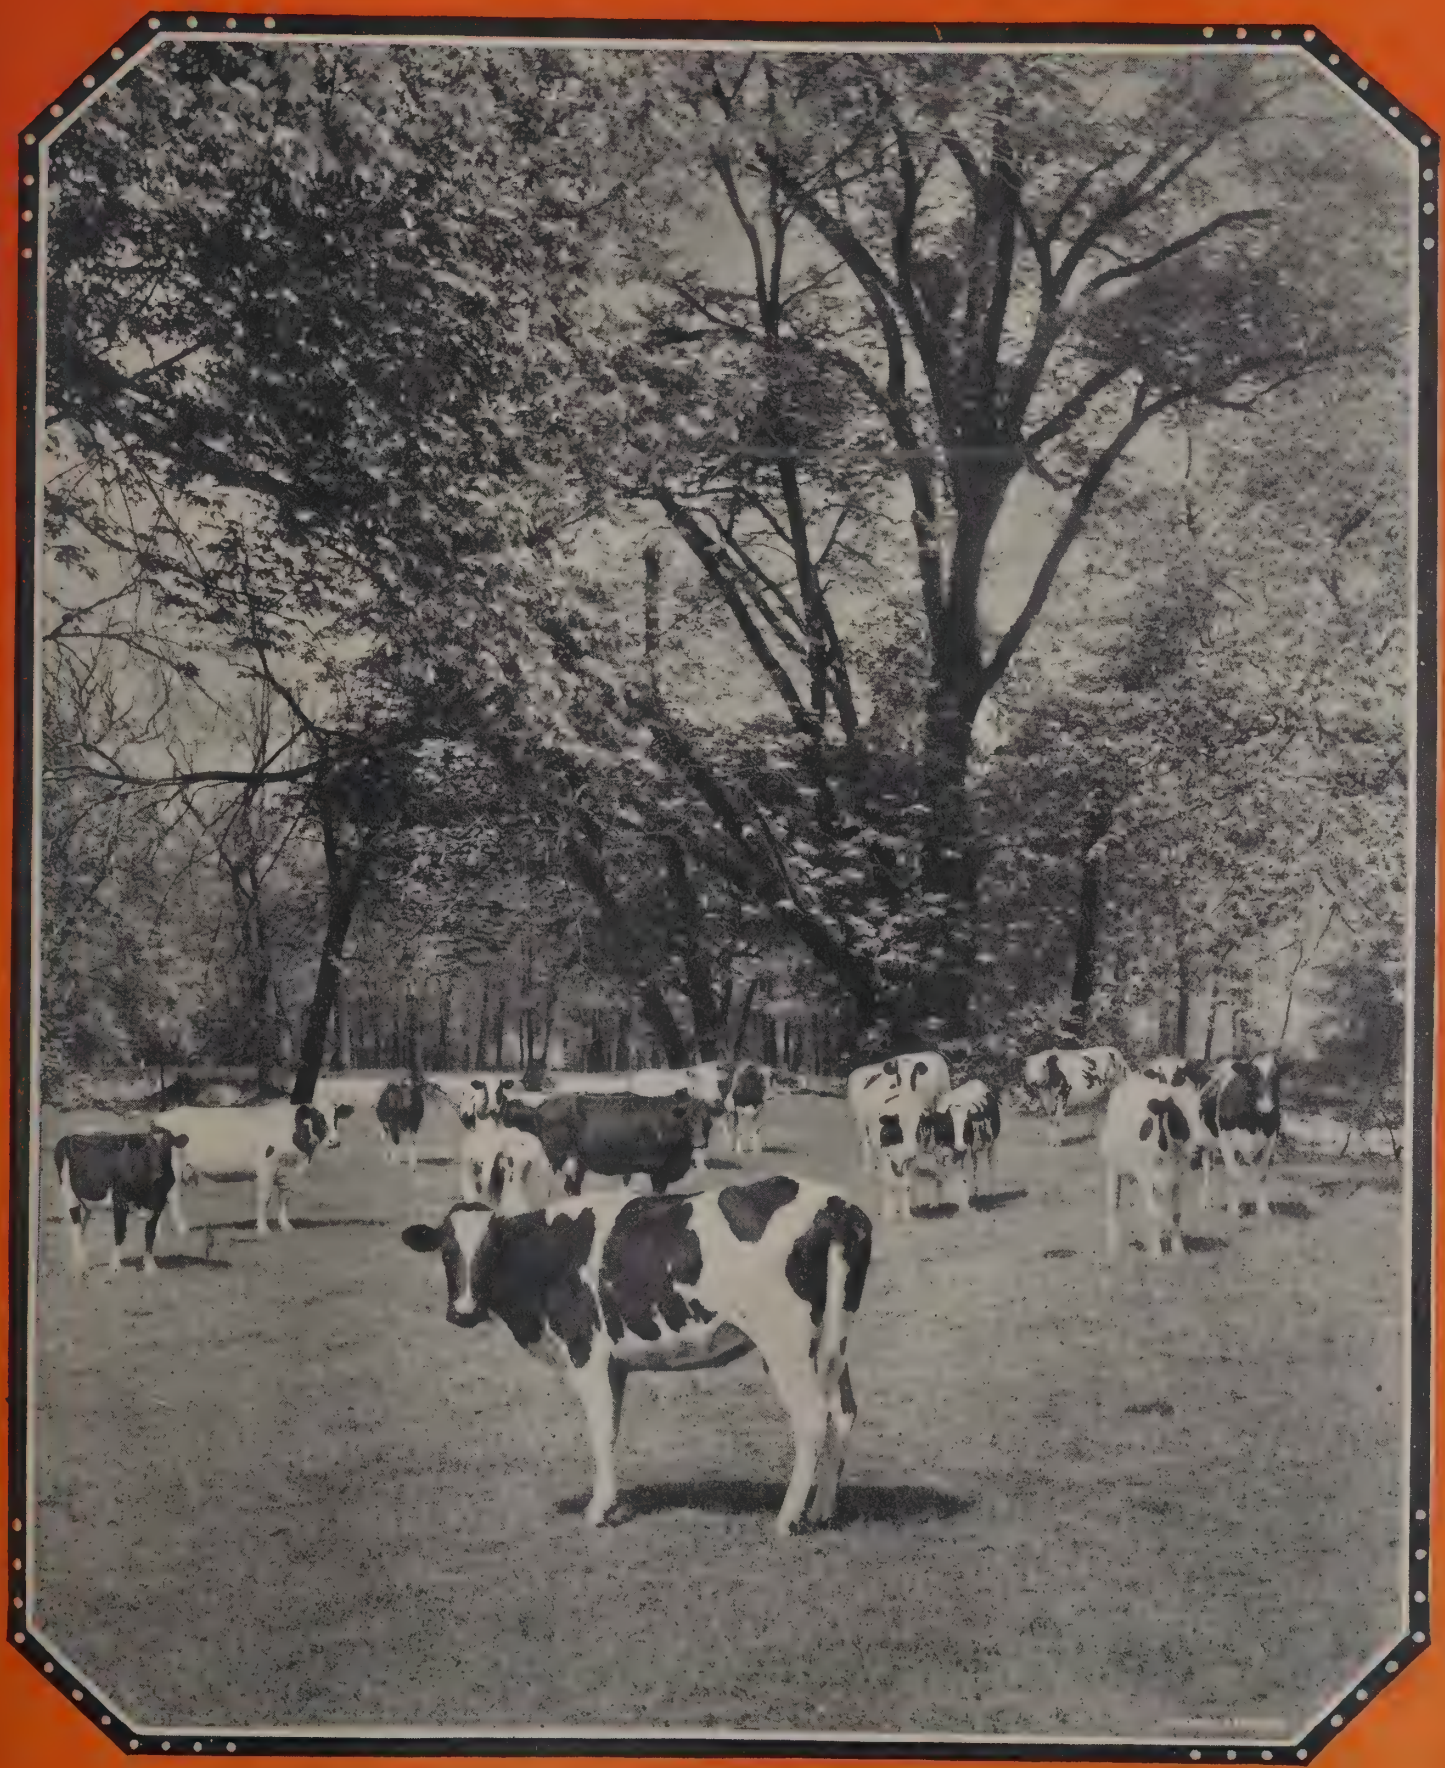
Now loose dandruff is one of the easiest diseases to combat. If you have the slightest evidence of it, go after it immediately with Listerine, the safe antiseptic.

Here's how you do it: Simply douse Listerine on the scalp full strength and massage thoroughly. Listerine softens dandruff, while massaging loosens it, and permits the tell-tale white flakes to be washed away.

Keep the treatment up for several days. Do it systematically. Except in the most stubborn cases, marked improvement is apparent almost at once.

Lambert Pharmacal Company, St. Louis, Mo.

SPREADING LIKE WILDFIRE



So goes the good news about Listerine Tooth Paste—the dentifrice that gets teeth whiter in quicker time than ever before. The price—25c for the large tube.

LISTERINE

—and dandruff simply do not get along together

Volume 72, No. 14 Fort Atkinson, Wisconsin July 25, 1927

You Can Always Depend on

Polarine

THE PERFECT MOTOR OIL

No question about Polarine! Men throughout the ten states of the Middle West have learned that Polarine is the *right* oil for a tractor—that it's a dependable product—*always the same.*

For years men have depended on Polarine to take care of their tractors — to oil and protect every moving part of the engine — to avoid wear and prevent trouble and lengthen the life of the machine.

Polarine is low in price but high in lubricating efficiency. Your tractor couldn't run without lubricating oil of some kind. And Polarine is *the* kind—as thousands and thousands of farmers have discovered.

Polarine is *there*—wherever and whenever it is needed—lubricating every part of the engine —cushioning every frictional surface with a tough film of oil—protecting every vital part. It's good business to use Polarine. Polarine helps to reduce expenses — cuts down repair bills — enables your tractor to deliver the power you paid for — saves your hard-earned money!

You can always depend on Polarine—any time —any place. The quality of Polarine never varies from one year's end to another. Polarine is always the same. That word stands for oil of the highest quality. In the northern country of Minnesota, men are using Polarine exactly like that used in Southern Missouri.

Polarine was made especially for your tractor — whatever make you own. Standard Oil Company (Indiana) lubricating engineers studied the different types of tractors and developed a grade of Polarine to meet the exact needs of each type. The chart will tell you the grade to use.

To get Best Results—change your motor oil at frequent intervals.

For correct grade consult chart at Any Standard Oil Service Station.

Standard Oil Company, 910 So. Michigan Avenue, Chicago

[Indiana]

Why Land O' Lakes Creameries Have Lived

JOHN L. RICHARDSON, WASHINGTON

FTER adopting practices that would enable it to produce the best quality butter made in the ry, it is only natural that the esota Co-operative Creameries' iation, now known as the Land akes Creameries, Inc., should be taking in deciding upon a trade for its product. The experi- of the various California co-op- es and the fame gained by the h "Lur Brand" butter have t the significance of a catchy name. The association adver- for suggestions for an appro- name, offering five hundred s for the best suggestion. As a , 70,000 letters proposing more 70,000 names were received.

ter a long and careful process election and elimination, the "Land O' Lakes" was decided as the best adapted for this su- butter. The importance of a le trade name can probably be understood when it is known there are now some 2,700 s of butter on the markets.

Inspection Brings Results

great deal of credit for building e high standard of Minnesota r is due to the thorough system spection used by the association. e butter produced by the mem- reameries is assembled in St. Duluth, and Chicago. At these ntration points all the butter is ted and scored by government tors who are paid by the asso- n but who are furnished by the esota State Department of Ag- ure co-operating with the Unit- ates Department of Agriculture. h print of Land O' Lakes but- accompanied by a certificate ng to its inspection, which reads lows: "U. S. Department of Ag- ure. Minnesota State Depart- of Agriculture, St. Paul, Minne- Certificate of quality. I here- rtify that I have personally in- ed the butter contained in this ge and the quality of it was 93 gher."

ese inspection practices have be- well established with consum- d absolute faith and confidence aced in butter which has been ct to such rigid and careful in- ion. Consumers are willing to a premium when they are as- of a uniform, high quality uct such as the Land O' Lakes r represents.

Field Service

provement has been the motto e Minnesota creameries from the very beginning. The central organization has always appreciated the significance of education in bringing about the desired results. There are 16 fieldmen scattered throughout the producing area; and each man has between 30 and 40 local creameries with which to work. When the government inspector sends an unfavorable report concerning a creamery in a particular fieldman's territory, the fieldman hurries to this creamery and helps remove the trouble. He advises the local buttermaker and assists in finding and overcoming the source of difficulty.

One of the newer developments is that of checking up on the quality of cream delivered by the patrons. High grade butter cannot be made from low grade cream. Fieldmen often go to a creamery and list every can of cream delivered according to its grade. They will then go out to the farms of the patrons who delivered the low grade cream and help rectify the difficulty. The trouble often arises from some minor detail which is very easily taken care of after it is found, and patrons are glad to have help in locating and overcoming such hindrances because improvement in quality brings greater returns.

Direct Contacts

One of the most recent and outstanding plans put into operation by the Land O' Lakes Creameries, Inc., is that of making direct contact with chain store concerns. In April, 1925, the John T. Connor Company, of Boston, signed a contract for all of its chain store butter requirements for the following year. This deal amounted to about 250 cars of Land O' Lakes butter. Since that time great progress has been made in this direction and as a result a great portion of the output of that association is going directly to the chain stores which is a wonderful outlet for the quality product.

Under the old system of marketing, in which each co-operative creamery marketed its own output of butter, there were no thoughts of contracts. But under the federated system the local creamery signed a contract to deliver all of its butter to the association for a period of two years. Withdrawal can now be made at the end of any year. This agreement calls for payment of liquidated damages amounting to one-half cent per pound for all butter marketed outside of the association. No withdrawal was allowed until the close of the first two-year period, in this way permitting the association at least two years to get well established. Only 12 of the 427 member creameries exercised this privilege at the end of the first two-year period.

Patrons of the local creameries are now asked to sign contracts calling for the delivery of all of their milk or cream to the local creamery for a period of five years. Both contracts, that between the local and the association and that between the patron and the local, carry clauses specifying certain liquidating damages and providing for injunction against further breach of contract.

Factors of Success

Several factors have contributed to the success of the Land O' Lakes Co-operative creamery system. The more important of these are listed as follows:

1. The Land O' Lakes system has been built from the "ground up." It has depended upon a strong local unit in the form of thriving local co-operative creameries.

2. A sound financial policy has been in vogue from the beginning. The local creameries were not built until after a thorough preliminary survey had been conducted. If enough capital was raised and a sufficient volume of business guaranteed to insure successful operation, the venture was launched. The central organization was not organized until enough local creameries signified their intention of joining to make efficient operation possible.

3. Cardinal principles of co-operation as expressed by one vote per member, payment of going rate of interest on stock, and pro rata division of profits to members have always been followed.

4. The importance of educational work has been forcefully emphasized. All members of the system have been taught the fundamentals of co-operative effort, and this has made possible a smooth-working and efficient organization.

5. A uniform, superior quality product, which meets the demands of the most particular consumers, has been developed.

6. An aggressive merchandising and sales policy has been put into operation. This has made possible greater profits and a larger demand or outlet for Land O' Lakes butter.

7. Regulation of production to meet demand has been attempted in a small way by a plan to market sweet cream during periods of excess butter production. This has proved satisfactory and promises to help solve the surplus problem.

8. Contracts have been successfully used. Their purpose is not that of holding the members in the organization, but merely to serve as a basis for sound business foresight.

9. Quality improvement has been stressed in all stages of production. Field service has been used to raise the quality of the cream produced on the farm, and government inspection depended upon in the central plant.

10. Lastly, a policy of securing the most efficient and well trained managers, inspectors, and salesmen has been followed with utmost care and precaution.

GUERNSEY COW, HYLAN COTTAGE LASSIE

This cow is now in fifth place in Class B, by virtue of her recently completed record 17,081.2 lbs. milk, 913.2 lbs. fat, made while carrying calf 219 days of her test period. She is owned by C. L. A. Whitney, New York.

Isaac—"Oi, oi, der vedding invitation says: 'R. S. V. P.' Vot does dot mean?"

Jacob—"Ach! Such ignorance. Dot means to bring 'Real Silver Vedding Presents.' "

Comfort and Safety With Economy

Combined with their cushioning "give", for comfort, the wiry strength of Fisk Balloon Cords sets new standards for complete safety and long mileage.

By a patented process, "Fillerless" Cord, Fisk eliminates cross strands, equalizes strain on cords, and sheathes each cord in pure live rubber. All Fisk Balloon Cords are made by this process.

In the familiar Fisk tread, thick, tough and durable, skid preventing and puncture resisting, you will find the reason why users of Fisk Balloon Cords roll mileage records up to unaccustomed heights.

There is a tire for every need—in type, size and price—in the Fisk line.

VACATION TIME IN COWLAND

G. A. WILLIAMS, INDIANA

S the sun rises higher and higher in the sky at midday, beating down with withering rays eld and fores+ alike, the fra-e of the wild flower becomes weet and the song of the bird requent; all life craves a period laxation and ease. Human na- involuntarily gravitates toward woods and shady fields. The of the soil arranges his work so the family can spend an occa- day forgetting the endless rou- of duties. Vacation s a universal appeal to ike.

e experienced dairyman found that it pays to de a liberal vacation for high producing dairy Unfortunately a num- f factors which tend to such valuable individu- orking overtime are not ed to the minimum.

sh, sweet creamy milk ld from the refrigera- much appreciated by notor tourist. Children t feel that they can call ay unless they have had r three ice cream cones perhaps a malted milk, chocolate bar, or some dainty which required in its preparation. The ds for these milk-con- g foods, to say nothing egular consumption of and butter, is sufficient e to prompt some own- milk the entire herd gh the summer months. if many cows do fresh- ring the fall, improved res and fewer flies tend set the normal decline duction. Before the at- nt is aware of it the g date is near at hand. cows do not have a dry at all and many oth- not stand dry long h for best results.

dairy cow is the hard- worked animal on the even under favorable ions. When pastures hort and dry the labor must be expended in securing aily feed allowance adds that extra to the daily up-keep. make matters worse, flies do hing in their power to make iserable for old Brindle. How ite and swarm and buzz during at of the day when she is try- make milk from the feed she ly partially digested! Then the supply may fail to meet her

matter how well the herd is and cared for, it is nearly im- le under ordinary conditions to me all these factors. The vig- he cow is taxed and her system ed. It is little wonder that the summer milk flow suffers a severe drop in many herds.

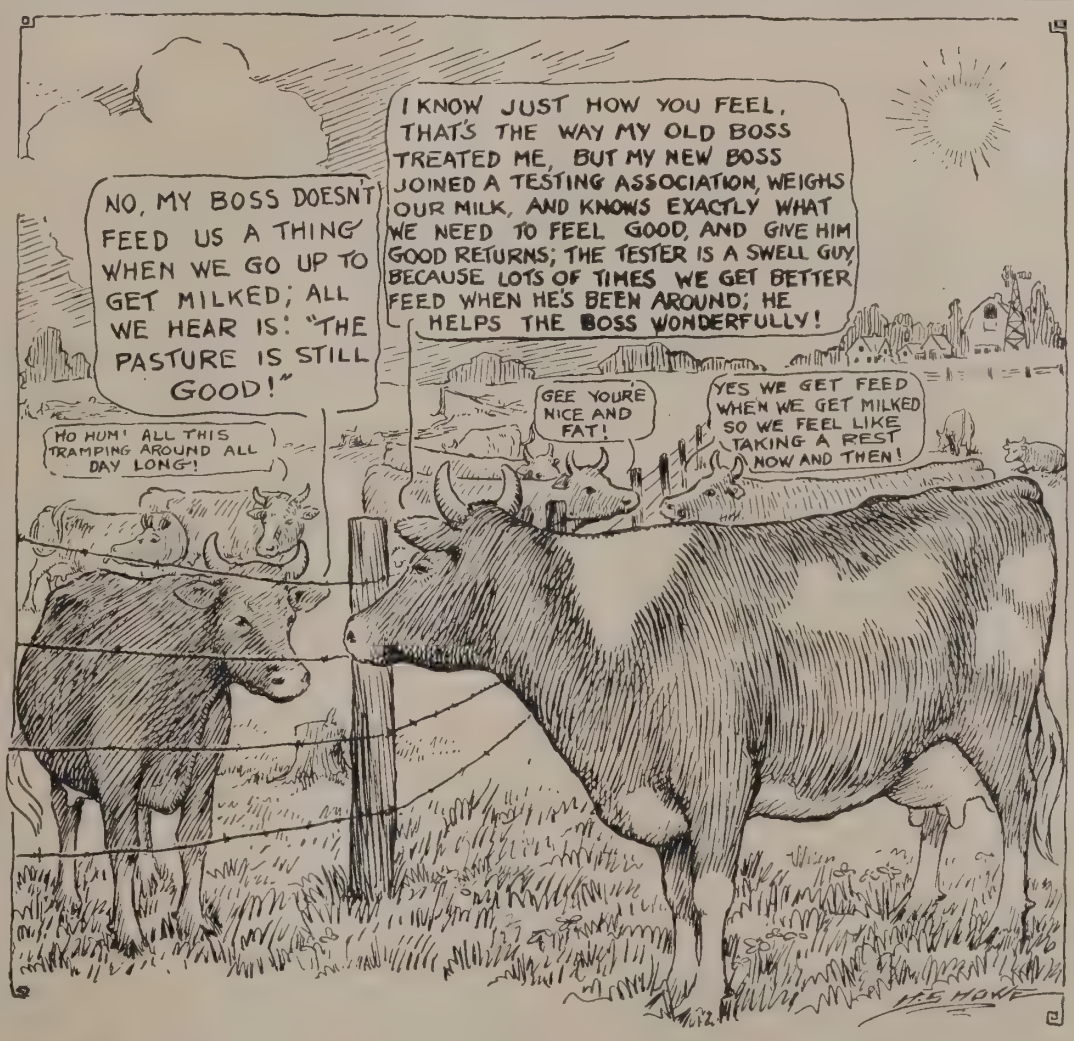
Feed is the source of all milk. The pastures and other feeds which the cow receives during the summer may not provide for the maintenance of the cow and the milk produced. Animals with marked dairy temperament will draw on reserve materials stored in the body to maintain production. This will continue for some time but ultimately the live weight will be reduced and the milk flow falls off. From this time on even the best ration will not restore production. It requires a dry period in addition to feed before the cow can give her maximum return for feed consumed.

The careful dairyman avoids such a condition. Liberal feeding during the dry period provides the heavy producer with some additional reserve to fall back on and which, when a proper ration is fed, will bring her to the ninth or tenth month of her lactation in fairly good condition. The more flesh the cow has lost the sooner she should be turned dry.

It is not an uncommon thing to hear someone say, "That cow will not go dry; she milks up to freshening." Such animals must be forced to take a vacation. In many cases improper care and poor management are responsible for keeping the cow in milk at this time. The feed which the attendant allows the cow to consume must be used for the production of milk or stored in the body. When dairy temperament is present, as it usually is with these persistent milkers, there is no inclination to build up the body and add to the live weight. Naturally the tendency is to provide milk for the rapidly developing fetus.

The secret of drying off the cow lies in reducing the ration. If this is begun long enough ahead of freshening and rigidly enforced, there are few if any cows which fail to respond to the treatment.

It must be borne in mind that while the cow is being underfed and receiving an inferior ration she will lose flesh quite rapidly. It is very necessary to know the exact date the cow was bred. If plenty of time remains before the calf is born this loss in live weight can be replaced.



When the herd is running on pasture, drying a cow off presents more difficulty than later in the year. Some cows must be shut in a dry lot for a few days. The grain ration should be withheld and a poor grade of dry roughage fed. In extreme cases the water supply must be curtailed.

Regular and complete milking should be avoided during the drying off period. There is some difference of opinion among dairymen on this point. Some prefer skipping a milking after production is as little as eight or ten pounds daily; in three days skip another milking and shorten the interval until the cow is milked once daily. They maintain that the operation of milking stimulates the gland; when the cow is milked she should be milked dry. Others claim that incomplete milking will decrease production. The advocates of this plan recommend leaving a little more milk in the udder each milking. Perhaps a combination of the two methods is advisable. In any case care must be taken to prevent undue inflammation in the udder. Drawing just enough milk to relieve the fever may have to be done occasionally; this will vary with different individuals. As soon as the production ceases a liberal supply of grain should be provided. The mixture need not be high in protein since only the body maintenance is to be cared for. Corn is high in total digestible nutrients; it is usually plentiful on dairy farms and possesses plenty of palatability. It is well to add some feed such as ground oats or wheat bran to furnish bulk and a little linseed oil meal to keep the bowels active. (Cottonseed meal should not be fed to dry cows.) A mixture of 600 lbs. corn meal, 200 lbs. wheat bran or ground oats, and 100 lbs. linseed oil meal has been fed to dry cows with good results. The daily allowance will depend on the size and age of the cow, the length of time she will be dry, and her condition at the time. Heifers carrying their second calves should be fed quite liberally. Probably six to ten pounds of grain daily for each cow would be satisfactory for the first two or three weeks.

The corn should be gradually reduced as parturition approaches. It is a heavy feed and high in energy producing materials. During the last

SOME INTERESTING SUBJECTS WERE BROUGHT UP

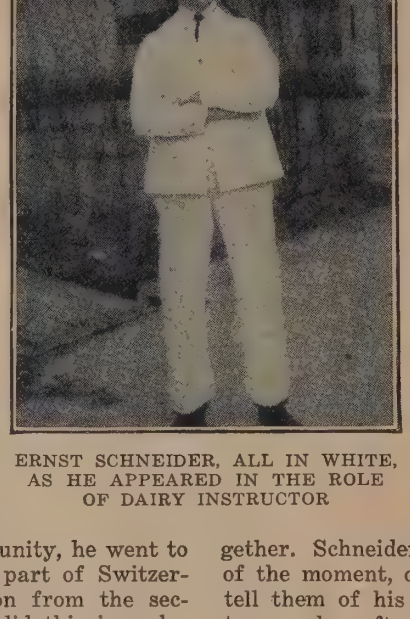
SWISS YOUTH WORKS FOR EDUCATION

GUY A. PETERSON, WISCONSIN

FROM a nearly penniless immigrant to a college graduate with a responsible position in a large dairy plant in five years is a record made by Ernst Schneider, a farm boy from the mountains of old Switzerland and a member of the 1925 class at the Wisconsin College of Agriculture.

Schneider's record is well worthy of the attention of any farm boy who wants to make good either on the farm or in some other line of work. He was even more handicapped than many farm boys who are merely without funds, for he had neither funds, friends, nor a speaking knowledge of English. He came to America with the intention of remaining only two years, but when he saw that it was possible for a student to work his way through school he stayed and has now taken out his second naturalization papers. In those five short years he has mastered the English language, gone through a four-year course in college to win his degree, earned all the money for his education in addition to enough to visit his Switzerland home, and is now in a position where the future looks bright indeed to him.

Hopes to Own Dairy Company



He is working for a Chicago dairy company where he is doing the work with his characteristic Swiss zeal. He hopes some day to own and operate a similar distributing establishment that he might serve farmers and the consumers at the same time. He appreciates the advantages he has received in America, hoping soon to become a useful citizen of the United States. He says that in Europe it is almost impossible for a boy without money to work his way through school because the pay is so small and the work is so strenuous.

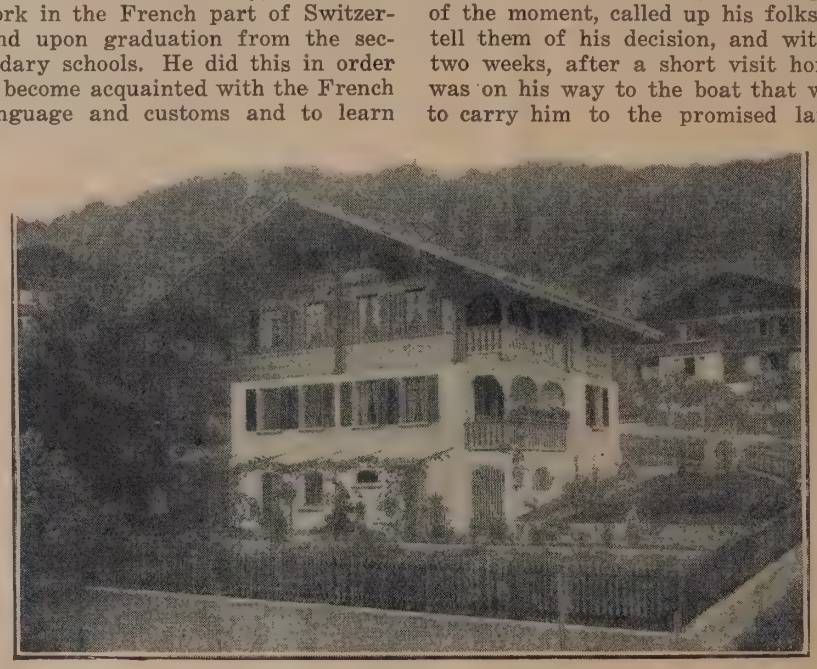
Schneider's early life was not dissimilar to that of many American farm boys, though it may have been somewhat harder and under a more strict system of discipline. He was born twenty-five years ago in Spiez, the German part of Switzerland, on a fifty-acre farm that his father, Gotfried, has rented since 1895. The fact that this is the second largest in that community gives one a good picture of the size of farm business there.

Electricity Much Used

In that mountain section many farm operations are still done by hand labor because the land is too rough to lend itself to power farming. Electricity, however, is coming in very rapidly with many of the small jobs around the home and barn now being done by this force. It has been put to many uses on the Schneider farm. When Ernst was twelve years old he had to get up at four o'clock in the morning to cut grass with a scythe for his father's herd of sixteen Simmental cows, and grass is still being cut for them in the same way. During the summer this was a daily task, for the cows were kept in the barn, as the land could do double duty by raising grass and an orchard crop of apples at same time.

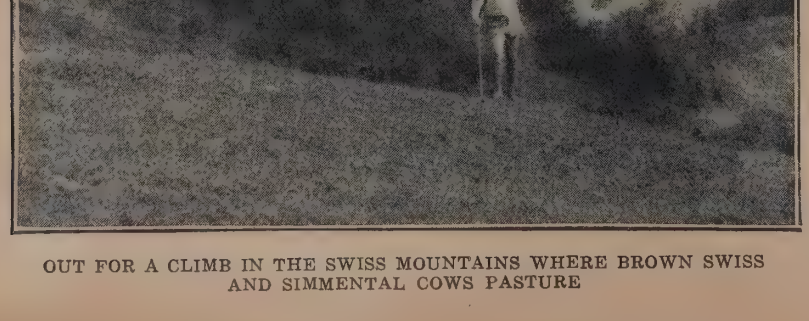
The Schneiders are proud of the fact that no woman of their family has ever had to milk cows, this being always done by the male members of the family. Milking was therefore an early job for Ernst and continued to be so all through his elementary and secondary school years.

ERNST SCHNEIDER, ALL IN WHITE, AS HE APPEARED IN THE ROLE OF DAIRY INSTRUCTOR



Works in French Vineyard

As is the custom for middle class farmers in his community, he went to work in the French part of Switzerland upon graduation from the secondary schools. He did this in order to become acquainted with the French language and customs and to learn different methods of farming. It was a 40-acre farm largely devoted to vineyards that supplied him with work from four in the morning to nine in the evening at a salary of $5 a month, at a time when a pair of shoes cost $4.



So strict was the working schedule that he had to remain on duty until eight o'clock in the evening on the one day a great friend of his came at noon to pay him a visit. It was work of this kind, however, that trained him for the later task of earning his way through school. He spent the next three years in various occupations, studying a part of the time in an agricultural school at Munsingen, working on his father's farm, overseeing a group of fifteen women on a vegetable farm that furnished Hausanne and Geneva with vegetables, and tending the cider press in a huge cider mill.

Sails for America

It was while he was making cider that a friend of his suggested they go to America together. Schneider, acting on the spur of the moment, called up his folks to tell them of his decision, and within two weeks, after a short visit home, was on his way to the boat that was to carry him to the promised land.

BEAUTIFUL OLD SWISS FARM HOME, SET IN THE SHADOW OF THE MOUNTAINS AND A FRAMEWORK OF FLOWERS, WHERE ERNST SCHNEIDER LIVED AS A BOY

OUT FOR A CLIMB IN THE SWISS MOUNTAINS WHERE BROWN SWISS AND SIMMENTAL COWS PASTURE

Arriving in Milwaukee, Wis., with only a few dollars in his pocket, it was by mere chance that he got into conversation with a Swiss farmer from Spring Valley, the "Little Switzerland of America." It so happened that this farmer owned a cheese factory for which he was seeking a cheesemaker. He offered the place to Schneider, since he just naturally supposed that anyone born in Switzerland could make cheese.

The young immigrant had never made cheese because his father sold milk and cream for the butter trade, but he took the work as the first thing that presented itself. A stranger in a strange land, doing a strange work, may sound a bit lonesome and dramatic, but Ernst had so much to do to learn the ropes in his new occupation that he didn't have time to be lonesome. He was busy, too, getting a speaking knowledge of the English language.

Attends Dairy Course

Hearing of the dairymen's short course for cheesemakers that was being given at the Wisconsin College of Agriculture, the next fall he set out for the University to make a lasting friendship with Professor E. H. F rington, head of the dairy school noted authority on dairy proble Farrington took an interest in youth from the first, giving him w as an assistant in cheesemaking smoothing the path to knowledg every way he could.

Schneider worked in the dairy partment all that year, entering University as a "special" Fresh in the spring of 1922 after man long hour of wrestling with adopted language. He was fortu in securing a place as a desk bo the University Club, where he s times worked fifty hours a week the same time carrying a full sc ule of studies in college. For thi bor he received his board and r filling the position with such effici that he was given the job all years of his college career.

Has Profitable Summer

The summer times for Ernst full of excitement as well as p for it was during the summers he earned the surplus money ne for all kinds of incidentals. At close of his Freshman year he the club on a bicycle for Green C ty to sell books. Within four w he had done so well that he excha the bicycle for a motorcycle, and weeks later bought an old Ford. made $900 that first summer.

The second summer he sold Ford, purchased a Dodge, and out into the country to sell bru Inside of three weeks he was the man for the Madison office, and short time broke the high hour, week, and high month records of for that company. Near the en the summer he was the second l est salesman out of the 5,500 or road.

Visits Homeland

At the end of his junior yea went back to Switzerland to visi parents and once more roam ove home land, for he had decided to out his papers and become a nat ized American citizen. His visit t land of the Alps was not to be en ly spent with his parents, how for he had hardly remade his quaintance with them when the mons came from Berne, asking to represent the Swiss governme the reception committee to show egation of American agricul journalists the beauty spots of Si erland. Naturally he accepted honor, with the result that glowing tributes to the gracious of Switzerland as a host were appearing in the American ag tural press.

He had hardly returned home this adventure when Asher Ho American representative at the tute of Agriculture at Rome, wr him asking him to take a ten-day ing trip through the streams passes of his scenic country. A tain climber from his youth an miliar with the very heart and h of his native land, there was no that he enjoyed more than to co with this request, so Asher H received what he called, "A that is a guide."

The end of the summer cam too quickly, but Schneider was to get back to his studies an work behind the desk at the Uni ty Club. He finished his Senior with a creditable record, thus pleting in 3½ years a 4-year cou dairy husbandry. He left the J versity at the highest beginning ary that has ever been offered graduate from the Dairy Depart but all those who have watched young man grow say, "He is wort

Dairying in the Western Counties of North Carolina

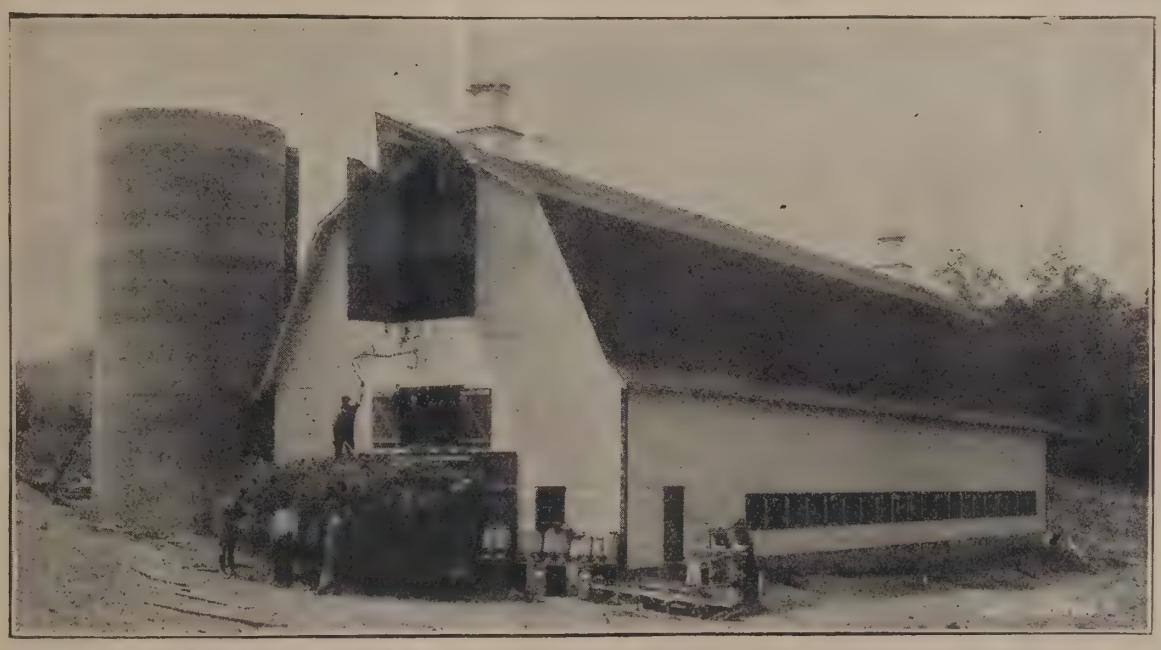
dairy cattle, Sutton & Son's English stock beet was introduced and advocated in Clay, Cherokee, Rutherford, Macon, Iredell, Wilkes, Wautauga, Caldwell, and Swain Counties. This was the first attempt ever made to produce these beets on a practical scale for providing a succulent feed in the western counties. As a result of dairy extension work in 1924, the first pure-bred Guernsey heifer was placed in Macon County, the first pure-bred Ayrshire cow in Wautauga County, the largest strictly modern dairy barn was built in Wautauga County, 14 pure-bred bulls were bought in the western counties, 13 pure-bred females and 63 grade females purchased, 34 farmers agreed to build silos and 6 community bull associations were organized and bulls placed in Western North Carolina. The first cream shipping agitation was begun in Cherokee County and many cans were shipped during the summer.



In 1925, the dairy work centered around "better dairy farming through cow testing associations and better feeding methods." The Buncombe—Henderson Cow Testing Association was organized with 24 herds and over 500 cows enrolled. The Gaston Cow Testing Association found that they were paying excessively high prices for dairy feed so they appointed a committee of three to purchase grains necessary for a balanced ration. The committee bought enough grain for all the cows in the association, mixed them and sold them to the members at an average net saving of $14.00 per ton. Many hundreds of tons were bought and mixed by this association.

FILLING A SILO IN CLAY COUNTY

A method of extension education used extensively last year was the feed schools conducted on dairy farms in the owners' barns where roughage and grains for milk production were discussed at the time of year which permitted the farmer to arrange for growing the proper crops and resulted in a larger acreage of soy beans among the dairy farmers than ever before.

Last year, 80 farmers engaged in the dairy business who had never done it before, 18 pure-bred bulls were placed, 133 dairy cattle placed, 14 silos constructed due to information given at feed meetings, 4 barns were remodeled and 3 new ones constructed, and 5 community bull blocks were organized and bulls placed in them. F. R. Farnham is the extension dairy specialist in this section.

DAIRY BARN BUILT ACCORDING TO EXTENSION SERVICE PLANS IN BUNCOMBE COUNTY

Clay County Dairy Project

In 1924, a county agricultural agent was employed in Clay County and he soon came to believe that the future of Clay County lay in dairying. He advocated dairying as the county seemed well adapted to raising pasture and feed crops and because it gave the farmers a good

LIFE AND WORK OF T. L. HAECKER

No. 2

In the first chapter of this story, Professor Haecker told of his early experiences in running a dairy farm, in the farm manufacture and merchandizing of butter, in selecting dairy animals, and in co-operation.

His son, A. L. (Archie) Haecker, now secretary of the Nebraska Creamery Butter Manufacturers' Association, has written this next chapter which supplies a number of interesting details about the operation of Silver Springs Dairy, his father's Cottage Grove farm.

T. L. HAECKER AT 28 WHEN HE ENTERED THE GOVERNOR'S OFFICE

My Great-grandfather Brown settled on Silver Springs Farm in the summer of 1841, coming from Ohio in a covered wagon. His name was Roswell Brown and my grandfather, Orvin Brown, occupied the farm to the east. Silver Springs Farm really was one of the first big dairy farms in Dane County, for Roswell Brown was a dairy farmer with considerable experience, and in the fifties he kept as high as twenty cows, making butter and cheese which were first marketed in Milwaukee, as that was the principal trading point. This farm comprised several hundred acres at that time and had nine springs. In fact, it was selected on account of the excellent pasture and numerous springs, all of which were counted essential for dairying.

I believe it was in 1878 that father bought his first forty at Cottage Grove. The first crop planted that spring was oats, with a liberal seeding of red clover. The clover made a good catch and produced two very heavy cuttings. The second cutting was saved for seed and produced a big crop. The growing of clover at that time was not common, and little was known of its value either as hay or a soil builder. The next year, or in 1879, the farm was increased in size by the purchase of two more forties, and farming was begun in earnest. As early as 1880 we had a small dairy and were making plans to increase the herd. In fact, in 1880 we had to hire a man to do the chores, having enough live stock to warrant this.

Use First Patent Churn

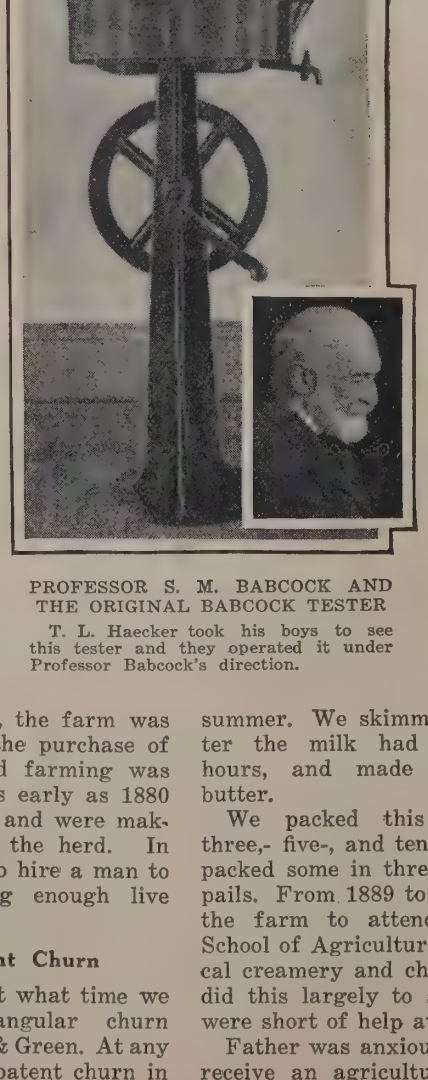
I don't know just at what time we purchased our rectangular churn from Cornish, Curtis, & Green. At any rate, it was the first patent churn in our part of the country and was a great curiosity. It was a box hung by the corners. Later I think we bought a barrel churn.

The winter of 1881 was known as the big-snow winter. I mention this because I recall how difficult it was to transport anything from country to town. We made butter and it was supposed to be delivered once a week in Madison, but there were times when we could not get through. The snow was something like five or six feet deep on the level. I don't think anything like it has ever been known since.

From 1881, when we started our dairy, to 1889, we made butter and sold to customers in Madison. Our common practice was to set the milk in shot-gun cans, covering same with cold water—we used ice some of the time in summer. We skimmed the cream after the milk had set twenty-four hours, and made this cream into butter.

We packed this butter in two-, three,- five-, and ten-pound jars; also packed some in three- and five-pound pails. From 1889 to 1892 when I left the farm to attend the Minnesota School of Agriculture, we sold to a local creamery and cheese factory. We did this largely to save work as we were short of help at that time.

Father was anxious to have us boys receive an agricultural education. I remember that he told us about a school in Guelph, Canada, where practical agriculture was taught. This was, I think, in 1880 or 1881, and he was making plans to send my older brother to that institution. As soon as Professor Henry came to Wisconsin, Guelph was forgotten and it was not long before a short course was offered in agriculture at the University at Madison.

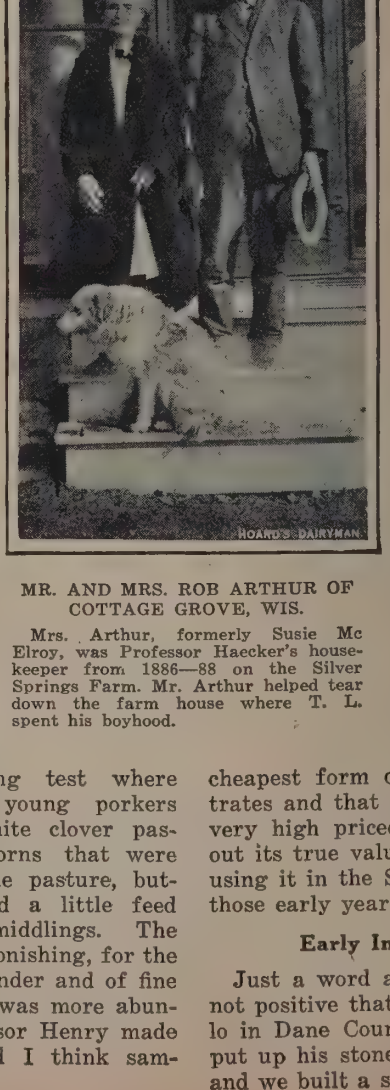


From my earliest recollection, and that's about fifty years, my father was talking about agricultural education. I believe he was one of a committee who brought pressure to bear on the regents of the University of Wisconsin; insisting upon a practical agricultural college and bringing up to Madison men like Professor Henry and Babcock.

In 1882 our dairy herd was greatly increased. We purchased a carload of fine dairy stock, including an animal known as Nebette, a most beautiful Jersey heifer. We also bought a young bull known as Jumbo of Riverside. This bull came from two of the most famous Jerseys in the country. His grandmother on one side was Mary Ann of Saint Lambert, and on the other side he traced to old **Eurotas.** He proved to be a most exceptional animal and was the foundation of some excellent stock.

SILVER SPRINGS DAIRY AT COTTAGE GROVE AS IT APPEARS TODAY

The house is the same as when Haecker lived there but the other farm buildings used to be on the opposite side of the road. T. L. planted these beautiful shade elms.



PROFESSOR S. M. BABCOCK AND THE ORIGINAL BABCOCK TESTER

T. L. Haecker took his boys to see this tester and they operated it under Professor Babcock's direction.

Farm Feeding Experiments

Father was continually making experiments. In fact, we had sort of a substation. I recall a little feeding test where we fattened some young porkers on bluegrass and white clover pasture, Burr Oak acorns that were most abundant in the pasture, buttermilk, skimmilk, and a little feed such as shorts and middlings. The results were quite astonishing, for the meat was not only tender and of fine quality, but the lean was more abundant. I recall Professor Henry made some photographs and I think sampled the pork.

MR. AND MRS. ROB ARTHUR OF COTTAGE GROVE, WIS.

Mrs. Arthur, formerly Susie Mc Elroy, was Professor Haecker's housekeeper from 1886—88 on the Silver Springs Farm. Mr. Arthur helped tear down the farm house where T. L. spent his boyhood.

This was one of the early tests to demonstrate that a protein ration would influence the quality of the pork. We also carried on some gravity creaming experiments, and father determined that the milk from certain cows would cream much quicker than that of others. We had one big, white Shorthorn grade in our herd that required from 24 to 36 hours to cream. In fact, her milk must have had very small fat globules for it was exceedingly difficult to get the cream on her milk. We had Jerseys whose milk would in two and one-half hours.

Now you can see the oil supply in the new 1927 Series De Laval Separators

This feature enables new De Laval users to see at all times how much oil the separator has and the condition it is in. You will like it.

The Oil Window

"The best separators ever made," say all who have seen these new De Lavals — unrivalled for clean skimming, ease of turning, convenience of handling and durability.

OTHER FEATURES

1. Turnable Supply Can: The supply can may be turned so that tinware and bowl may be put in place or removed without lifting the supply can from its position on the separator. Every user will like this feature.

2. Easier Turning: For three years the De Laval experimental and engineering departments have been conducting extensive tests to develop still easier turning separators. The results of these tests are embodied in this new series, which start and turn easier.

4. Floating Bowl: All new De Lavals have the wonderful "floating bowl," now used in De Laval Separators with such splendid results. It is self-balancing, runs smoothly without vibration, with the least power and wear, skims cleaner and delivers a richer, smoother cream.

You can't afford to use any other separator. A new De Laval will soon pay for itself. Sold on easy terms. Trade allowances made on old separators.

his careful instructions. He told us just what to do and how to do it.

Father was a great believer in advertising, both in papers and at the fairs. We generally had a small ad running in the "Dairyman" whenever we had anything to sell. We also made the fairs, especially the state fair which was held at both Madison and Milwaukee some time in 1885 or '86. We also got into the Guernsey business, keeping both a herd of Jersey and Guernsey cattle.

Dorset-Horn Sheep

We had Dorset-Horn sheep which were imported from Canada; and we kept White Leghorn chickens. Before the White Leghorns, as early as '78 or '79, we kept Brahmas. The Dorset-Horn sheep were about the first brought into Southern Wisconsin. They were noted for their medium wool and fine quality mutton. They were also most prolific, as they lambed twice a year —spring and fall—and always had either twins or triplets.

In May, 1886, McCormick held a great sale in Chicago where a Jersey herd was dispersed at public auction. I went with my father to this sale. He purchased several head of cows and heifers and I shall never forget the great difficulty we had getting through the streets of Chicago to the freight depot. There was a strike among the carpenters and shop men, and this strike tied up traffic. The strikers were parading and wore shavings around their hats as a trade decoration. They carried a big banner with the words, "Ten Hours' Work and Twelve Hours' Pay." We reached the depot after several hours of struggling through blockades of teams and paraders.

Musical Neighbors

Mr. C. E. Leslie went with us. I shall never forget the fine picture he made. He was driving in a rig with my father, and they would occasionally force a passage for us, and once in a while they would get out and hold the team. Mr. Leslie always wore a stove-pipe hat, a large diamond pin, and was dressed in superb and up-to-date fashion. He stood over six feet, wore a black Van Dyke beard, and had a wonderful bass voice. He and father were very close friends in spite of the fact that Mr. Leslie bred Aberdeen-Angus cattle. The Leslie farm was about a mile from ours. Mr. Leslie was a famous composer of music, writing twenty-four or five books of music before his early death which came when he was about fifty-five.

Perhaps some of the old-timers will recall the Doddy Songs written by Mr. C. E. Leslie. When he wrote them he drove down in front of our house one evening and gave us the first concert. It was fine music. Mr. Leslie had an excellent bass and his wife a beautiful alto. His niece, Grace Drakley, sang soprano, and his brother-in-law, Earl Burwell, tenor. So they had their quartette and they put on their songs at the fairs.

Subscription Rates

Subscription in United States and Mexico three years for $1.00; single year, thirty-five cents. Canada, three years, $2.50; one year, $1.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $1.00 a year; not in Postal Union $1.50 a year. These rates include postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers who farm with businesslike methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received thirteen days previous to the date of publication. Advertising to be classified or changes in advertising must reach us three weeks previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Silage Feeding Experiments

A. W. Oldershaw reports in the Journal Royal Agricultural Society, England, the results of two experiments in which the milk production of lots of cows fed on rations containing mangels was compared with the milk production of other cows receiving rations containing similar amounts of starch equivalent and protein, but in which the succulent roughage was derived mainly from silage. Milk production was slightly better with the root rations in both experiments, but was practically equal for the cows which ate the silage readily. Certain individual cows would not eat the silage.

A man is himself plus the books he reads.

Co-operative Milk Plant for Indianapolis

Plans are being perfected for the erection and operation of a farmer-owned milk distributing plant in Indianapolis. An option has been secured, by the Indiana Dairy Producers' Exchange, on a tract of land and it is expected that building operations will be started in the near future. It is proposed to erect a plant equipped to handle surplus milk and to distribute whole milk at wholesale and retail. The new enterprise is to be financed by the issuing of certificates of indebtedness bearing interest at the rate of six per cent. In distributing these, preference will be given to farmers who have signed contracts agreeing to market their dairy products through the new plant.—Agricultural Co-operation.

Licensing Makers in Ontario

HOARD'S DAIRYMAN:—Ontario cheesemakers and buttermakers are now working under a licensing system which came into effect a couple of months ago. This involves 785 cheese factories and 277 creameries that must have their operators licensed as efficient and capable makers of cheese and butter.

To qualify for a first grade certificate a cheesemaker must have had 93 per cent or over of his 1926 make of cheese grade "Firsts" by the federal graders. For a second grade certificate he must have at least 88 per cent of his cheese to grade first. Where less than 88 per cent grades first the maker can only secure a permit which entitles him to operate a factory for not longer than two years. If at the end of that period the permit holder can not qualify for a certificate he will not be permitted to continue as the head maker in a cheese factory or creamery. The certificates are of such size that when folded they can be enclosed in a pocketbook which permits the maker to carry it with him when applying for position.

In the award of first grade certificates the maker must know how to operate the Babcock test. This has put a number of makers into the second grade. It has been the practice in most of the cheese factories to have the maker take composite samples of milk from each patron which are tested each month by the dairy instructor who visits his factory.

When the campaign was on for cream grading in Ontario the question for grading milk for cheesemaking received considerable attention. The writer outlined this question pretty fully in Hoard's Dairyman at the time and it aroused no little discussion both here and elsewhere. The dairy department considered this a too far-reaching undertaking to take up. It is here mentioned merely because it was largely from this discussion that the granting of certificates to cheesemakers came into being. Under the present system no factory can accept milk that has been rejected at another factory. If this is done the certificate of the maker is cancelled. A time limit of ten days is fixed during which a patron whose milk is rejected by his own factory can not have his milk accepted at another factory. If his milk on the day after rejection is all right it will be accepted at his own factory providing he improves the quality of his product thereafter. This regulation was worked into the certificate plan to prevent disgruntled patrons from going to other factories and to prevent makers in these other factories from accepting milk rejected by other makers.

This latter provision of the certificate plan fills a long felt need and in a way accomplishes what was expected that grading milk for cheesemaking would do. It takes care of the patron who supplies good milk and penalizes the patron who attempts to deliver an inferior quality of milk that injures the finished product. It is roughly estimated that 10 per cent of the patrons of cheese factories in Ontario do not supply a first class milk for cheesemaking. Why should the other 90 per cent be penalized because the 10 per cent do not try to improve?

Canada. J. W. WHEATON.

Builds Up Worn-out Soils

HOARD'S DAIRYMAN:—When B. Kloepping of Dawson County, Nebraska, came to the farm which he now occupies, seven years ago, the land was pretty well run down. The best that he could expect in wheat yields was 20 to 25 bushels per acre. The corn was poor to medium in yield.

Mr. Kloepping is making use of barnyard manure and sweet clover in building up the fertility. Every year along in February he scatters sweet clover seed on his winter wheat land. The seed is mostly unhulled seed, just as it came from the threshing machine. There is never an acre of winter wheat sown but what the sweet clover is added along in the winter months.

Irrigation is practiced on the Kloepping farm. Each fall after t plowing for the winter wheat crop completed, the field is listed with t lister furrows three feet and 8 inch apart. Then the irrigation water turned down the lister furrows that the entire field is thorough soaked. When the field is compa tively dry, a cultivator is used throw the dirt into the lister furro The field is then double-disked, h rowed twice, and the wheat is drill In the fall of 1926, the wheat yield 47 bushels per acre.

Besides the sweet clover, manu is applied to the land which is to into corn every spring. The soil now well filled with organic mat throughout.

Nebraska. H. H. BIGGA

Illinois as a Dairy State

The farm value of dairy produ in 1926 was $101,563,830, accord to estimates by A. J. Surratt, A cultural Statistician of the Illi Crop Reporting Service. This e mate shows an average productio 4,368 pounds milk for each of 1,039,000 cows, or a total produc of 4,538,216,930 pounds for the st

The average farm price rece for the entire state was $2.238 hundred pounds milk. In the Chic dairy district the average was $ as compared with $1.96 for the so ern half of the state.

BUCKEYE BALLOON

Kelly quality in a moderate-priced tir

THERE are many car owners who do not feel that they need the extra long mileage of a tire such as the regular Kelly-Springfield. To such tire buyers we say:

For the amount of money you want to spend you can buy a Kelly-built tire, the Buckeye, that at its price represents just as great value and just as much quality as the higher-priced Kelly product. Buckeyes are sturdy, full size, full ply tires, built to give honest service. You will find that they compare favorably with many higher-priced tires.

"Kelly dealers everywhere—there must be one in your town"

diana's Gold Medal Herd Repeats

G. A. WILLIAMS, INDIANA

NCE 1917 the Indiana State Dairy Association has sponsored the 300-lb. Cow Club as a me- for stimulating herd improve-. Membership in this club is ed to the owners of herds hav-0 or more cows completing year- ecords above 300 lbs. butterfat. ertificate is issued to members, a bronze medal awarded as well. of the 10 cows each produce 400 fat, a silver medal replaces the ze one. Dairymen who are suc- ul in developing 6 of the 10 cows 500-lb. records are presented a gold medal. When Mr. Riggs leted the cow testing association for 1925 he qualified with a sub- ial margin. Not only was he the dairyman in the state to win this r, but it remained for him to his own record two years later qualify with a higher herd aver-

comparison of the cow test as- tion records of 1922 and 1927 what rapid progress has been in that time:

	Cows	Milk Lbs.	Fat Lbs.	Feed cost	Income
	9	6,487	351	$ 77.15	$136.55
	10	8,583	492	115.25	180.42
se		2,096	141	$ 38.10	$ 43.87

e Vanderburgh—Warrick Cow ng Association, of which Mr. s has been a continuous member, been in charge of Mr. Clint F. r for seven years. Every month r and breeder study the records ully and outline the feeding pro- for the succeeding month. cow is studied and her individu- es and dislikes are taken into ac- . It is seldom that two cows in herd receive exactly the same ration during any period. Grain l according to the milk produc-

might be assumed that the grain n fed under such conditions l be a very complex one. Such t the case. Corn, oats, bran, nseed, oil meal, and a small ity of commercial dairy feed to 7 of the cows have formed the ntrates entering into the grain re. The protein content is kept as near 16% as possible, but since individual desires are considered more important than anything else, each cow practically balances her own ration. Owing to soil conditions alfalfa hay is hard to secure locally. Soy bean hay has proved a very satisfactory substitute, although several attempts have been made to grow this legume on the farm.

Mr. Riggs began farming some 20 years ago, keeping grade Jerseys. It is only nine years ago that pure-breds were added. Care has been taken in selecting the foundation females, as also the herd sires used to head the herd.

About the time he started in pure-breds a bull and several females were brought into the county from Central Indiana by a local dairyman to start a registered herd. It was natural that a man of Mr. Riggs' type should be interested in these animals. He studied them carefully, and when they were entered in the cow testing association he eagerly watched for the monthly report. Something about that herd of cows appealed to him. He decided to bring some of the blood to his own farm at the first opportunity.

Later when this herd was dispersed, several daughters of Lynhurst Golden Prince, the male which came from Central Indiana, were purchased. The results were so gratifying that additional cows of the same breeding have been bought whenever possible. At the present time six members of the present gold medal herd are sired by this bull. The remarkable thing about these cows is their ability to make high records the first lactation. Four of the six have exceeded 500 pounds of butterfat as 2-year-olds, and the other two have not fallen very far behind. Any bull which transmits such high production is truly an asset to the breed.

Fortunately Prince is still in active service in Vanderburgh County, the property of Wilbur Neidig. Breeders are realizing the value of this bull and are breeding a number of cows to him each year.

This does not indicate all that has been accomplished during that time. Believing that a good herd of Jerseys is the best asset a young man can start out with in Southern Indiana, this progressive dairyman has been laying a foundation for his son, James, who rendered very faithful service in developing the herd. When the son began farming for himself on a nearby farm, the foundation herd was tapped of some of its richest blood. Last year these were entered in the local C. T. A. under the name of James A. Riggs. This reduction in numbers accounts for the fact that a second gold medal was not carried to Vanderburgh County one year earlier.

What Mr. Riggs has accomplished on this Southern Indiana farm is one more illustration showing what may be accomplished when records and breeding are firmly welded into one superstructure of herd improvement. The constructive breeder must have ideals; he must refuse to swerve from his course until those standards have been attained. It is impossible to estimate the value of such men in developing the dairy industry. The owner of Indiana's twice gold medal herd is such a man.

None!

No Long Tubes No Claws

The Surge Milker

You will NEVER know how *easy* a milker can be to wash UNTIL you have washed The Surge Milker. No Long Tubes! No Claws!

Ever try to wash a mess of long tubes and twisted claws? Try it once . . . . then try The Surge and *see how much easier it is! Another thing!* Long tubes and claws with their cracks, crevices, twists and turns are bacteria breeding grounds. The Surge has NO long tubes! NO claws! That's WHY Surge Owners find it so *easy* to produce clean low bacteria count milk and get premium prices.

6 Milkings FREE!

Right in Your Own Barn—With No Obligation to Buy

Don't buy ANY milker UNTIL you have tried The Surge Milker with its wonderful NEW method that milks cows like no other machine has ever milked cows before. Our liberal "6 Milkings Free" Offer lets you see for yourself just what The Surge will do for you—and there is no obligation to buy unless you want to. Once you see it milk your cows—even "that cow" you think can't be milked by machine—once you see how easy it is to operate and how much EASIER it is to clean—*you won't be satisfied until you own one!*

Mail coupon now for special price, Free Demonstration and Easy Terms Offer. Learn what this wonder milker will do for YOU!

Easy Terms
You can buy a Surge Milker on very easy terms. We'll figure to use any equipment you may have already in your barn. You'll be surprised how little it'll amount to. Mail coupon now. It doesn't obligate you.

Mail Coupon for Free Book

We have just issued a NEW Surge Catalog that tells you MORE about milking and milking machines than anything you've ever read. It's a very valuable book for any farmer milking cows to have. This coupon will bring it to you—FREE.

Mail It Today SURE!

PINE TREE MILKING MACHINE CO. Dept. B-985
2843 West 19th Street, Chicago, Illinois

Please send me without cost or obligation, Free Surge Catalog and tell me about your special Free Demonstration Offer on the SURGE Milker. **(Please give this information.)**

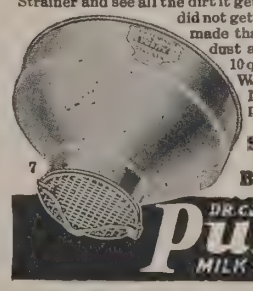
Mastitis and Off-flavored Milk

HOARD'S DAIRYMAN:—I recently read an inquiry in the issue of Hoard's Dairyman under date of April 25 captioned "Off Flavored Milk." For the benefit of inquirer, I will state that I am at present, and have been for several years, producing raw milk for retail distribution. This necessitates, in order to be successful, the most minute and detailed attention to secure best flavor and odor, and last summer for the first time I found exactly what he is being troubled with.



I am positive that if he will watch carefully the cows he mentions whose milk seems to be affected, and observe their quarters closely to ascertain if they come to the barn from pasture with one or more quarters hardened and possibly inflamed, or at any rate if he suspects any of them and finds the milk tasting salty or becoming off color, just secure sample and send to the state bacteriologist and ask him to test it for mastitis. I am sure you will find your trouble to be caused by mastitis infection. I have lost 54 cows in the past ten months with this infection. Two cows' udders rotted off, others lost from one to three and sometimes all four teats and had to be slaughtered. The flavor and odor were exactly as described, only my case probably was more aggravated than his seems to be. I was about three months in finding the cause of this terrible odor and flavor. It sometimes developed slightly stringy milk.

Our state veterinarian, Dr. Lytle, stated that there was not, to his personal knowledge, a record of as aggravated case of mastitis infection as was mine. We have gotten relief, at least temporarily, by having a serum or bacterin made from the bad milk or pus from these bad teats, this being used to vaccinate the entire herd.

Corwallis, Oregon. S. B. S.

Make This 10 Day Test

Try Dr. Clark's PURITY Milk Strainer for 10 days. Pour your milk through an ordinary strainer and note the amount of dirt and sediment removed. Then pour the same milk through a PURITY Strainer and see all the dirt it gets that the first strainer did not get. It's the only strainer made that gets ALL the dirt, dust and sediment. Made in 10 quart and 18 quart sizes. Write today for the 10 Day Trial Offer and prices.

DR. CLARK'S Purity MILK STRAINER

Gives any speed you want-instantly

50,800 FARMERS and DAIRYMEN all over the country now save work and time with power houses equipped with the CEDAR RAPIDS SPEED GOVERNOR and the CEDAR RAPIDS LINE SHAFT. Give special speeds for separator, churn, pump, washing machine, wringer, grindstone, etc. One gasoline engine or one electric motor operates all the machinery. Write for special cash price and free power house plans.

CEDAR RAPIDS FOUNDRY & MACHINE COMPANY
Box 909 Cedar Rapids, Iowa

The city kid was roaming about in the country when he came upon a dozen or so empty condensed milk cans. Greatly excited, he yelled to his companions: "Hey, fellers, come here quick! I've found a cow's nest!"—The Albers Egg Maker.

EDITORIAL COMMENT

A NATIONAL PROBLEM

The Mississippi flood which has made thousands of farmers and others homeless, destroyed their property, and laid waste thousands of acres of land, presents a real national problem. Since the Mississippi river drains 39 states, handling the Father of Waters becomes a national question. It would be unfair to expect the few states which have sustained these heavy losses to bear the expense of providing against any such devastation in the future. It is an engineer's problem; no one else has the knowledge or experience to handle it.

There seems to be a difference of opinion among the men trained for this kind of work as to which is the better method to follow to prevent a similar calamity. We have no doubt but that in time the engineers will agree upon some plan that will handle the flood waters of the Mississippi and prevent future loss of life and property. When such a plan is presented to our government it will be the duty of Congress to make sufficient appropriation to carry the plan into effect. It would seem that President Coolidge has this in mind. When he was approached to reduce federal taxes he reminded those interviewing him that the federal government would be called upon to expend millions in making provisions to take care of the future flood waters of the Mississippi.

THE METHYLENE BLUE TEST

At a meeting a few months ago with city health officials and other interested persons we suggested the use of the methylene blue reduction test as a practical means of grading milk for direct consumption in those cities not provided with bacteriological laboratories. Smiles of superior knowledge greeted this suggestion and we were assured that this test was not sufficiently searching for this purpose. We regret we did not then have the report of recent investigations at the Vermont Experiment Station, the conclusions from which are pungently stated by the authors as follows:

"In the work herein reported the methylene blue reduction test proved to be a more accurate measure of milk quality than the agar plate count. Since it is also simpler, cheaper, and more rapid than the agar plate method it would seem that it should be more generally used as a test for grading milk."

Bulletin 264 of the Vermont Station at Burlington is necessarily technical in character, but it contains food for thought for those who worship at the shrine of the bacteriological plate count, as well as for that large body of dairy farmers who have been looking for some simpler, if not better, method of determining milk quality. The methylene blue reduction test is coming into increasing use at cheese factories and it is worthy of a wider trial in determining its efficiency in grading milk for direct consumption.

LONG DISTANCE FORECAST

It has become quite the thing to forecast market conditions and various other items. In the past, prices of agricultural products have traveled in what is termed cycles. For example, for a certain period the price of hogs was relatively higher than the price of corn which was followed by a period when corn was higher relatively than hogs. These cycles have been produced by farmers swinging in and out of producing a certain kind of product, to favorable years, and to other causes. When potatoes are high one year, an increased acreage usually follows the next year and as a result the price of potatoes is lowered.

Dr. G. F. Warren of the Cornell University predicts that following 1931 beef and dairy cattle will experience an abrupt drop in price. He says, "The market for heifers will be good, doubtless, until about 1931 and increasing numbers of them probably will be raised in the next few years. The best time to raise calves for the future is probably already past. Farmers who plan to raise cattle to sell later at a profit should start now. Far too many calves will be raised later."

It should be remembered that there is opportunity for factors to develop that will bring about no material drop in prices of live stock. Bear in mind no one is wise enough to state definitely just what will happen in the future and Dr. Warren understands that as well as any one. His prediction, however, is based upon what has happened in the past and on the general trend of human affairs. It is also well to bear in mind that those who produce high quality stock will not suffer the same depression in prices as those who raise inferior or mediocre animals. There is always a good market for well bred, capable dairy animals.

NATIONAL CHEESE INSTITUTE

To secure co-operation between producers, assemblers, manufacturers, and distributors of cheese in the United States, the National Cheese Institute has been incorporated. The purpose of the organization is to further protect the interests and general welfare of the cheese industry. It affords a means of co-operation between the federal and state governments in all matters of general concern to this industry. The Institute will direct itself to increasing the consumption of cheese and to educating the American public as to its true food and economic value. It will also assist in improving the quality of cheese.

Hon. J. D. Jones, Jr., former commissioner of agriculture of the state of Wisconsin, is the secretary of the new organization and will be in charge of its office and laboratory at Milwaukee, Wisconsin.

In commenting on the aims and objectives of the National Cheese Institute, the secretary says: "The aggregate annual production of all varieties of American-made cheese is in excess of 400,000,000 lbs. and the annual per capita consumption of domestic and imported cheese is a trifle over 4 lbs. The production, storing, curing, and manufacture of cheese is a fundamental part of the great American dairy industry. It has long been recognized that the cheese industry needs greater unity and cohesion; that it needs some impartial and unbiased central agency to work for the industry as a whole and whose standing is such that it can speak authoritatively for the entire cheese business. The National Cheese Institute will fill this need. It will afford common ground on which the producer, maker, assembler, manufacturer, and distributor may meet for the consideration and solution of common problems. Fundamental and foremost in the program of the Institute will be the promotion of a larger per capita consumption of high quality American-made cheese of all varieties. In working out this program, the welfare of the primary producer will be given first consideration. His position is basic, for on him and his effort the entire cheese industry is builded."

There is large opportunity for this organization to render a splendid service to the cheese industry of the nation. It must, however, keep in mind the rights of two groups of people, namely, the producer and the consumer.

SUNLIGHT AND LIME

Because of certain experimental work with chickens and goats, it has generally been assumed that sunlight and the ultra-violet ray would assist the cow in the assimilation of lime. This assumption has been rather disproved by experimental work recently concluded by Dr. Hart and his associates at the Wisconsin Agricultural Experiment Station.

The first experiment provided for the exposure of cows to direct sunlight during the month of June when the ultra-violet intensity of the sunlight was at its maximum. Despite this exposure, the cows failed to get into a positive calcium balance or, in other words, they failed to retain as much lime as they gave off in their milk and in their excreta. Reasoning from the experiments conducted with goats under the influences of the ultra-violet light, the experimenters came to the conclusion that summer sunlight, in comparison with the radiations of the quartz mercury vapor lamp, is feeble in its antirachitic or lime assimilating properties when considered in relation to heavy milking animals. Last winter, therefore, they radiated three good producing Holstein cows with ultra-violet rays from the mercury vapor lamp, later expecting to observe a favorable effect upon the animals. As previously stated there was no observable effect as the result of this treatment.

The conclusions of the experiment were that the ultra-violet light had little, if any, direct influence upon the calcium and phosphorus assimilation of dairy cows; it had no influence, either favorable or adverse, upon the milk production of the cow and it did not have any apparent influence upon the calcium and phosphorus content of the milk.

The suggestion is that the cow derives this antirachitic vitamin from the feed and is different in this respect from man, the goat, the chicken and probably the rat, all of which can be favorably influenced by the short wave lengths of solar radiation. The experimenters, however, caution that this investigation should not be interpreted as indicating that exposure of the dairy cow to direct sunlight is not beneficial.

OLEO MISREPRESENTATION

The National Dairy Council calls our attention to a misstatement of fact made by B. S. Pearsall, President of the Institute of Margarine Manufacturers, concerning research work carried on in England to determine the value of certain diets for growing boys. Mr. Pearsall is reported to have said:

"This research work consisted of feeding seven different groups of boys on as many different diets for a period of four years under the scientific observation of nutrition workers of international reputation. A plain and economical diet of bread, meat, vegetables, margarine, and a pint of milk per day produced by far the greatest growth in weight and height and the most satisfactory condition of health and spirit of any of the seven diets used in the experiments. These experiments on growing boys establish beyond any question or doubt what this institute has always claimed, namely, that margarine is a pure, economical, and wholesome food."

What the Medical Research Council actually reported, referring to feeding a group of boys the basic diet with vegetable oil margarine in place of butter, is as follows:

"When this result is compared with that obtained from feeding another batch with an equal quantity of butterfat, it is obvious that the vegetable margarine has failed.

"The group of boys who ate the margarine ration did not grow any faster than the batch of sixty-one boys who were taking only the basic diet, the average growth rate, 1.84 inches, being the same. The margarine group, however, has an advantage over the basic diet group in weight increment."

In this experiment seven groups of boys were fed the same basic diet. One group received the basic diet alone; another the basic diet plus milk; another the basic diet plus butter; a fourth, the basic diet plus margarine. Not until milk or butter was added did the boys show gains over those receiving the basic diet. The butter-fed group gained 20.9 per cent in weight and 20.6 per cent in height over the margarine-fed boys. Mr. Pearsall for some reason omitted this information.

This character of effort by Mr. Pearsall is quite in keeping with the general practice of many interested in the manufacture and sale of oleomargarine. To our way of thinking, they have never been able to present the merits of their product accurately.

Pink Buttermilk

Why will buttermilk occasionally have a pinkish r? I sell my buttermilk to customers and e in a great while it will get this pinkish color ch I cannot account for. My cows get grain year around besides pasture.

Teston, Iowa. J. B.

is possible that the pinkish color of the but- ilk may be caused by certain bacteria or by t growing in the buttermilk, but this would be ewhat unusual. It is also possible that the ation in the color of the buttermilk may be ed by the butter coloring as an appreciable unt of the butter color remains with the but- ilk. If there is a variation in the amount of er color used, there is likely to be a pinkish to the buttermilk in those cases where a r amount of the butter color is lost in the rmilk. It is also possible that this condition t occur in the spring when the cows go on ure and the milk itself is highly colored.

Killing Canada Thistles

there anything I could spray on a Canadian e patch which will kill the thistles without y to the other grain?

ge, N. D. M. H. K.

e Canada thistle is a troublesome weed and lt to destroy. Many schemes have been de- to destroy it, but none of them work as ef- ely as desired.

e of our Illinois subscribers recommends so- arsenate for destroying thistles. He uses easpoonfuls of sodium arsenate to ten quarts ater. The solution is usually applied with a ar sprayer about every ten days for several hs, beginning as soon as the plants start to It is important not to permit live stock ve access to the treated patches for at least days after the last treatment, as the solu- s poisonous.

ere possible to cultivate or use a hoe, proba- is is the most efficient means of eradication. uires persistency and means frequent cut- so that there will not be sufficient growth ground to keep the roots alive. If possible, the field before the thistle forms seed. Keep ld cleanly cultivated the balance of the sum- nd the following year plant corn in check Some men have found it possible to get re- by seeding to alfalfa, not so much as a er crop but for the frequent cutting that the thistle from going to seed and so weak- that it is more easily killed when the field into an intertilled crop.

Self-feeding Pigs

ave 70 spring pigs farrowed in late March arly April. They have the run of a self- filled with corn, shorts, and tankage. The ge is mixed with a mineral mixture in the tion of four parts tankage to one part min- ixture. Plenty of water and alfalfa pasture ovided. I would like to know if I am mix- e tankage and mineral in the right propor- Would you advise mixing shorts with the e and mineral? If so, in what proportion? til a few days ago I was hand feeding these I the corn they would eat and giving them made of shorts, salt, and tankage. The pigs onderful; they are not yet weaned. It is my perience with a self-feeder. I was nearly wn packing slop to them.

oway, Nebr. C. H. H.

uggest that our correspondent feed the corn f-feeder or compartment separate from sup- tal feeds; that he mix tankage, shorts, and meal in the proportions of 70 parts tankage parts each of shorts and linseed meal. This nental mixture should be fed in a separate der or in a compartment of the one in he corn is fed. We would feed the mineral e in a feeder separately from the other

happens that where corn and tankage, or emental mixture of which the largest part age, are offered, pigs will eat just about t amount of each to properly balance the If the mineral mixture is put with the ental mixture, the pigs may eat more of plemental mixture than is necessary. With pasture available, the pigs will eat less of plemental mixture in proportion to the ten than they would where no pasture is e. This is likewise true of the mineral .

e is no economy in carrying slop to pigs. e one can make them look fine by so doing, any finer than by self-feeding under the onditions. We have outlined how these pigs should be fed for maximum and economical gains, using self-feeders. It should be pointed out here, particularly to one who is having his first experience with the self-feeder, that it is not an automatic method; it will not run itself. One must keep the feeders supplied with feed and see that they are operating properly.

Skimmilk From High Test Milk

I am writing you for information on the composition of skimmilk and its feeding values of the three leading breeds, Holsteins, Jerseys, and Guernseys.

Beaver, Utah. T. C. P.

Milk testing 3.5 per cent will contain approximately 8.26 lbs. solids not fat as compared with 8.97 lbs. solids not fat for 4.5 per cent milk and 9.17 lbs. solids not fat for 5 per cent milk. We do not have available analyses of skimmilk secured from these but the solids not fat in the skimmilk would be somewhat larger per 100 lbs. than with the whole milk. However, assuming the same relationship exists, we would estimate on the average that Holstein skimmilk would contain approximately 8.3 lbs. solids not fat and Jersey skimmilk 9.2 lbs. solids not fat, while Guernsey skimmilk would contain 9 lbs. solids not fat.

As indicated above, the higher testing milk will produce skimmilk having slightly greater feeding value than does the lower testing milk. While this is true of the averages of all these different tests of milk, yet individual cows themselves will vary greatly. It would not be at all unusual to find milk testing 3.5 per cent fat that would have over 9 per cent solids not fat, while milk testing 5 per cent fat might have less than 9 per cent solids not fat. However, with a great number of cases averaged up, it would be found that the higher the milk tests the higher the content of solids not fat, and it is the solids not fat that represent the feeding value of the skimmilk. If considered on the basis of a large quantity of milk this is quite an important factor, yet in the case of the individual calf consuming less than 20 lbs. of milk a day, the additional feed value of the skimmilk containing more solids not fat is not a very material factor as it would provide not to exceed .1 to .2 of a pound additional feed material daily.

Price of Milk for Starter

I would like to know what is considered a fair price per hundred for whole milk testing from 3.3 to 3.6. The creamery here has installed a starter can and wants my milk for a starter. They think that $1.80 per hundred would be a fair price for milk delivered. I don't feel that it is hardly enough because I have plenty of little pigs to drink the skimmilk.

Will you please tell me what the regular price for milk is? What do you consider skimmilk is worth to a man when corn is a dollar a bushel and tankage is as high as it is now?

Little Cedar, Iowa. L. W.

Ordinarily a creamery will pay a considerably higher price for milk suitable for making starter than it would for the same amount of fat in cream or for milk of mediocre quality. It would seem that the creamery should make allowance for the extra care required to produce a high grade of milk as also for the higher cost of hauling milk compared to the hauling of its cream equivalent. These extra allowances should be added to the butterfat value of the milk plus the feeding value of the accompanying 80 to 85 lbs. of skimmilk that would otherwise be retained on the farm.

If the milk tests 3.5 per cent, the butterfat value at 50 cents a pound would be $1.75 for 100 lbs. of milk. With skimmilk at 50 cents a hundred pounds, the 80 lbs. of skimmilk would be valued at 40 cents, making a total value of $2.15 a hundred as the butterfat and skimmilk value of 100 lbs. of 3.5 per cent milk. To this should be added the allowances previously referred to for the extra care and the additional hauling costs.

The most usual method of estimating the value of skimmilk is to compare its feeding value with corn. Experiments indicate that when skimmilk is fed at a rate of not more than 3 lbs. of skimmilk to one pound of grain, 100 lbs. has a feeding value equivalent to a half bushel of corn. In other words, when corn is selling in the local market for $1.00 a bushel, skimmilk would be valued at 50 cents a hundred.

Another method of estimate shows that when fed properly, 100 lbs. of skimmilk is equal in feeding value to 7.29 lbs. of tankage and 10.86 lbs. of corn. With corn at 70 cents a bushel and tankage at $70.00 a ton, 100 lbs. of skimmilk would be valued at 39 cents. With corn at $1.00 a bushel and tankage at $70.00 a ton, 100 lbs. of skimmilk would be valued at 45 cents. With tankage at $80.00 a ton and corn at $1.00 a bushel, 100 lbs. of skimmilk would be valued at 48 cents.

Sunflowers for Silage

Kindly instruct me as to the right time to plant sunflowers for silage and how it compares with corn silage for feed; how thick should it be planted and how many pounds to plant per acre.

When is the right time to cut sunflowers for silage?

Marengo, Illinois. T. M.

There is considerable discrepancy in the reported experience relative to the feeding value of sunflower silage. We attribute this very largely to the varying results that men have secured in geting a palatable silage from sunflowers.

The most favorable reports we have seen state that sunflower silage is about 95 per cent as valuable as corn silage. This is better than most reports indicate, but apparently holds true in those sections where corn does not make a good crop. It is doubtful in our opinion as to whether sunflowers may profitably be grown for silage in those sections where corn makes a satisfactory crop.

Sunflowers for silage are usually planted in the same manner as corn. Ordinarily, the earlier the sunflowers are planted, the larger will be the yield. Planting is done at the usual time for planting corn, but because of the somewhat quicker growth of the sunflowers and because they are better able to withstand damage by frost, planting may be delayed some two to three weeks or more after corn is planted with reasonable promise of a fair to good yield.

The variety generally recommended for silage is the Mammoth or Russian sunflower, although in North Dakota the Black Beauty and White Beauty are reported as being highly satisfactory.

The amount of seed required per acre will vary according to the closeness of the rows and the nearness of the plants in the row. When planted alone, it will take from 6 to 8 lbs. of seed per acre. The seed may be planted with the corn planter or with the regular grain drill with the spout stopped up so as to plant in rows from 24 to 42 inches apart. If it is found convenient to cultivate in rows 30 inches apart, the general reports indicate that on good soil this distance of the rows apart will give the largest yield per acre. It is preferable to plant as corn is planted for silage, with the plants about 10 inches apart in the row. Under this system of planting the stalks will not be inclined to grow so large or become quite so woody.

The Illinois Agricultural Experiment Station recommends that the best results are likely to be obtained by ensiling sunflowers before more than 20 to 25 per cent of the plants are in bloom. Although the content of digestible nutrients increases slightly after this stage of development, the silage from the early cut plants is more palatable and will produce higher milk yields than that from the later cuttings. This station found that silage made from sunflowers cut 87 days after planting was superior to that which was allowed to mature for three weeks longer. The loss of juice from the silo when plants are ensiled at the immature stage may be prevented by allowing the plants to wilt in the field after harvesting and before bringing them to the silo.

The Illinois Station found as a result of its feeding trials that sunflower silage did not seem to cause any physical disturbances nor was the composition or flavor of the milk affected. The silage fed in these experiments proved much less laxative than corn silage and did not cause any increase of urine.

The sunflowers may be cut with the corn binder or may be cut by hand. The high growth of the plants make them a little bit difficult to handle and it will be somewhat more work to ensile them. We would particularly advise against the attempt to grow sunflowers and corn together because of the difficulty of handling the long stalks of the sunflowers having the heavy head at the top with the shorter growth of cornstalks where the weight is more evenly distributed.

Sunflower silage is not as palatable as is corn silage and cows must become accustomed to it before they will eat the sunflower silage readily. The reports we have received indicate that a mixture of corn and sunflowers is better relished by the cows than are the sunflowers alone. This may be accomplished by cutting in one load of corn to one load of sunflowers. In order to have the two plants ready for the silo at about the same time, the sunflowers should be planted some two weeks after the corn is planted.

Get Clean Plowing Behind Your Fordson

You know that good, clean, uniform plowing is your most important farming operation—that there is a positive relation between good plowing and good yields—that no amount of subsequent tillage will correct the mistakes of poor plowing—that good plowing requires, first of all, a good plow.

The John Deere No. 40 has the Bottoms Famous for Good Work

Good work by a plow depends primarily upon its bottoms.

The John Deere No. 40—the plow for the Fordson—is equipped with bottoms that are the products of nearly a century of leadership in building plows.

These bottoms scour and do the clean, thorough job that makes the perfect seed bed possible. There's a type for every soil.

The "40" pulls lighter because all of its weight rolls and because the hitch adjusts itself to make the bottoms run true and level at all depths.

It's the husky plow for the Fordson—beams are guaranteed not to bend or break; well-braced frame, with hot-rivited connections, has lasting rigidity.

See it on display in your town.

Write today for full information about the "40", to John Deere, Moline, Illinois. Ask for Booklet FT-514.

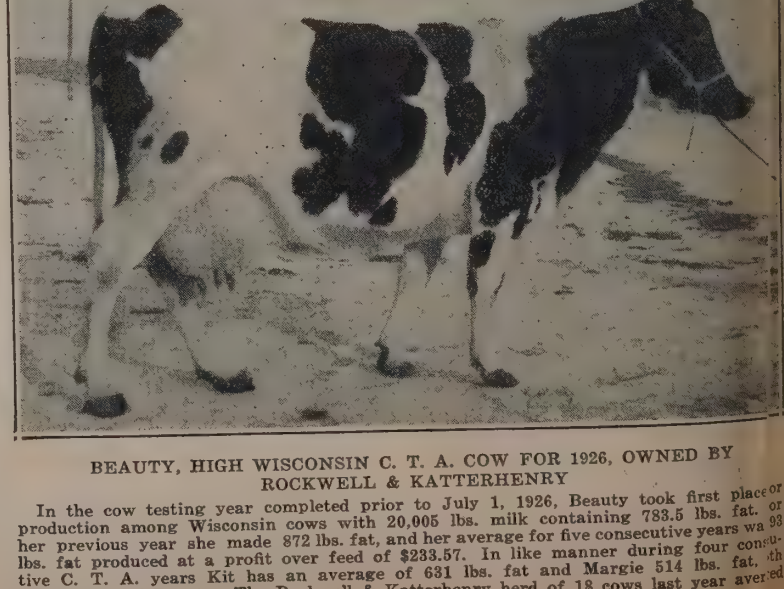
A Washington Tour

Factors which affect profits in Whatcom County, Washington, dairying were given consideration at the fifth annual cow testing association tour. Important points as size of business, use of mechanical milkers, high production per cow, and maintaining good production in late summer were shown by a survey compiled by R. M. Turner, farm management specialist from the State College of Washington, and presented by County Agent H. B. Carroll, Jr.

Figures were obtained from 35 dairy farms, all of which have completed one or more years of testing in the local association. Large and small herds were selected under a wide variety of conditions.

A dairyman with 10 cows or less has absolutely no chance of an income of $1,000 from his dairy herd, according to this survey. A herd between 11 and 20 cows has 7 chances out of 17 to make this income and a herd of more than 21 cows has 6 chances out of 8. Poor cows or high costs may have prevented him from receiving higher returns.

The average labor income from farms averaging 6.7 cows was $386.30 per farm; for 14.6 cows was $1,040,56; and for 27.5 cows was $1,466.09 per farm. These labor incomes include that sum which is left after all cost as feed, interest, and depreciation have been deducted, except labor costs.



Many dairymen depend upon cash crops to supplement their herd income. Besides growing much of feed for their cows, they prod grains, sugar beets, seed crops, p toes, and berries. Some like the c bination of dairy and poultry b ness, and much skimmilk in West Washington is being fed to chick which was fed hogs a few years

Machine milking makes it poss to handle larger herds. Twelve the 35 farms surveyed have mil machines for herds averaging cows each. These machines gre reduced the total labor cost per and raised overhead costs but sli ly.

High production per cow is most important single factor af ing dairy profits. When produc is under 300 lbs. of butterfat, it 56.1 cents to produce a pound compared to 39.1 cents with pro tion at 400 lbs. or more. The ave labor income per cow increased $24.04 in the lower herds to $ in the higher producing herds.

If his cows produce under 30 of butterfat, a dairyman has chance out of 8 of making $1,0 bor income, while if his cows pro over 400 lbs. of butterfat, he l chance out of 2, according to survey.

Many dairymen allow produ to drop in the late summer for of good pasture. As pasture i cheapest feed, one of low ca capacity is losing possible profit the owner. Three remedies are gested: (1) improving pastur suitable grass mixture, harro

BEAUTY, HIGH WISCONSIN C. T. A. COW FOR 1926, OWNED BY ROCKWELL & KATTERHENRY

In the cow testing year completed prior to July 1, 1926, Beauty took first place for production among Wisconsin cows with 20,005 lbs. milk containing 783.5 lbs. fat. For her previous year she made 872 lbs. fat, and her average for five consecutive years was 93 lbs. fat produced at a profit over feed of $233.57. In like manner during four consecutive C. T. A. years Kit has an average of 631 lbs. fat and Margie 514 lbs. fat, the stablemates of Beauty. The Rockwell & Katterhenry herd of 18 cows last year averaged 444 lbs. fat.

rement work in York County,
nsylvania, received a real impe-
in organizing the Northern York
nty Cow Testing Association
uary 1.
he systematic checking on the
k of individual cows in the herds

M. F. SCHAEFER, TESTER FOR NORTHERN YORK COUNTY, PENNSYLVANIA, ASSOCIATION AND HIS BUSINESS "AD"

members has already resulted in a siderable shift in cows and in nges in feed and management. In-or cows are being weeded out as r are discovered and the better s are given more feed and better e in order to fully utilize their erior working ability. Several e-bred sires of good breeding have n purchased by association mem-. There has been an increase in number of members and in the ber of cows tested each month e the association started. The ber of cows giving more than 0 lbs. of milk has also materially eased each month.
Villiam F. Schaefer is the tester harge. The progress made in the ciation is very largely due to the rest he takes in the work and the ice he renders. Mr. Schaefer s pride in his work and believes advertising. The accompanying tograph shows the tire cover on automobile adorned with a cow a suitable inscription calling at-ion to the association and its k. There should be marked dairy gress throughout that section of k County in which the association ates.
ennsylvania. E. B. FITTS.

The Separator Freshens

OARD'S DAIRYMAN:—Four times I found separators losing at the of $6 to $8 per month, but there worse ones in the country. About months ago I was asked by one of members if I wouldn't test his her's separator. The sample was ght. I could not read the test in skimmilk bottle. I took the re-ning milk along to the next farm, tested it in a milk bottle, and found 2.4% test. I wondered if he had not sent by mistake whole milk from a low testing cow.

The separator was thoroughly overhauled the following month and I learned that the cream check increased from $7 to around $35 without fresh cows. Can you beat that? The separator had "freshened."

WILH. BODEKER, Tester.

Milk Tubes

HOARD'S DAIRYMAN:—As tester for the Upsala—Swanville Cow Testing Association of Minnesota I have had opportunity of seeing milk tubes in actual use by different men. Some men are very careful, while others don't seem to care and the results are accordingly. One man used a tube in a cow's teat and caused blood poisoning which killed the cow. This cow was the best one they had in 1926. Another used a tube in a teat that had been stopped on. When he was through milking he took great pains to blow the dirt out of it and stick it in a can that was hanging on the wall where it stayed until the next milking. The cow had garget in the one quarter of her udder and was fast drying up. Experience is a great teacher, but the tuition is terribly high.

Unless the milk tube is used properly the cow is bound to lose at least one quarter through infection. It's very easy to get infection in the udder but a mighty hard thing to get out again. Be sure the tube has been properly sterilized and kept in a sterilizing solution from one milking to the next. Take the tube to the barn with you in the solution and place it near the cow to be milked. Do not take it out of the solution until you are ready to insert it in the cow's teat. Be careful and do not let it touch anything but the very end of the teat and be sure that that is washed clean. When you take it from the teat don't put it in again before it has been thoroughly sterilized.

HARRIS L. WARD, Tester.

The man who succeeds is the man who reads. Lincoln walked twenty miles to get a book.

FARMALL *Evidence*

"I just finished plowing 80 acres in 7 days with my Farmall, plowing 11 hours each day. I have had two other makes of tractors, but I can see that this is the only all-purpose outfit."
PAUL SCHRODER, Colfax, Wis.

"The Farmall surprised me by doing all that you claimed it to and more, too."
DAN W. TAYLOR, Corpus Christi, Texas

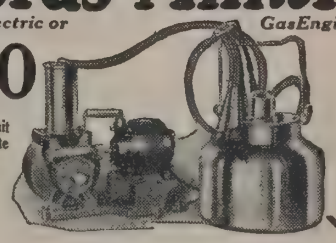
"Our Farmalls are very satisfactory at plowing. The soil here is hard to work and the moldboard will not scour, so you know they pull hard. I think the Farmall is the greatest machine since the binder."
THOMPSON LAKE FARM, Lewistown, Illinois.

"The Farmall is thoroughly competent to plow, harrow, culti-pack, drill grain, list for corn or peas, plant, mow hay, operate the binder, and besides that we have used it on any number of belt jobs. I feel you should know these things and know your company deserves a pat on the back for the Farmall. Please do not thank me for this as it is too well deserved."
D. M. HASTINGS, Atlanta, Ga.

Rear view of the Farmall, plowing. This also shows the high clearance over the rows of corn and cotton and other row crops. With this tractor you will be ready for next season's *planting* and *cultivating*.

PLOWING—
At Its Best and Easiest by FARMALL Power!

THERE is enthusiasm for the work of the Farmall wherever the Farmall appears. On all crops, on all jobs in field and barnyard, it shows the power farmer *something new in handling and efficiency*.



Plowing is one of its strongest suits. The Farmall owner goes out to tackle that once-dreaded job with interest and good humor. He has learned that Farmall and its plow will move handily and rapidly over the fields and leave well-turned furrows behind, in ideal shape for the operations and the crops to follow.

Remember that the Harvester engineers devoted several years to working out this all-purpose, all-crop, all-year design. They tried out thoroughly *every* type of design. When Farmall was *right for all drawbar, belt and take-off work* they offered it to the farmer. The Farmall is *the one all-purpose tractor that plows and cultivates row crops, too.* It is the feature of power farming today.

Plow your fields the Farmall way. Begin by asking the McCormick-Deering dealer where you can see a Farmall plowing.

PROPOSE MERGER IN NEW YORK

H. H. LYON, NEW YORK

AFTER many months of hard work the New York State Milk Producers' Program Committee on Unified Organization has made its report. Few people realize the efforts they have made to bring a report that will actualy benefit the dairymen they represent. This work they have done without pay. They called a meeting to be attended in Utica, on June 27, by delegates from the entire territory, each delegate supposedly to represent approximately 500 producers and to be chosen from different groups or from unorganized bodies. Some 300 dairymen attended the meeting.

When the committee made its report it did not recommend the formation at once of one united organization to handle the sales of all the milk. It did not feel justified in calling for the scrapping of existing organizations at the present time and from this position it refused to recede. The starting of a new organization at this time would be unwise and only lead to further discord.

This meeting was the culmination of the fifteen months' deliberation and taking of testimony. This testimony has been taken down by Mr. Bates of the State Department of Agriculture and Markets and is placed for safe keeping with the state college of agriculture at Ithaca. A summary of it, however, has been prepared and is available to some extent for distribution. The records, it is stated, contain "the greatest amount of authentic information on the dairy industry ever obtained."

While no new organization has been recommended, Chairman Ten Eyck contends that the better price for milk that dairymen are receiving and the almost assured advance in the fall fully justifies the existence of this committee and its work. "United we win, divided we lose," was on the banner back of the speaker's table. The chairman stressed the advantage to come from a single organization. "One tank for surplus milk," he shouted. The Federal Reserve banking system in which banks are supporting a "pool" has made the American financial structure the soundest in the world.

Aside from the 17-page mimeograph summary of the information obtained there are five columns, newspaper space, of recommendations by the committee. It is at once agreed that most of the producers of milk for the metropolitan market are affiliated in one way or another with some marketing organization. Then it is contended that the competing groups are reducing the price by competitive bidding. Again it is shown that they are reducing the price by attempting to avoid assuming a pro rata share of the burden of surplus. There is duplication of plants and unnecessary hauling charges due to the same competition. Probably none are getting the cost of producing milk, and they are not getting as much for milk as market conditions warrant.

The committee unanimously recommended two things. There should be created an advisory board at once. Second, there should be a referendum of dairymen as to the formation of a single organization. A resolutions committee was appointed with Congressman John D. Clark of Delaware County as chairman. This commi presented a resolution to the e that the delegates adopt the rec mendations for an advisory cou They recommended further that advisory council be composed of following members: The execu committees of the following organ tions: Dairymen's League Co-op tive Association, Inc.; Sheffield ducers' Co-operative Association, Unity Dairymen's Co-operative A ciation, Inc.; with one additional member from each organization each 10,000 members or major f tion, thereof. This report was ad ed. It was reported that the N Pooling Dairymen's Association the Eastern States had ceased to erate. There will be four forms organization for dairymen to con er in the referendum: The Lea Sheffields, Unity, and the John plan. It looks as though the Sheffi and the Unity are somewhat at v ance from the others. Evidently th is much to be done yet.

It seemed evident that there some disappointment that a single ganization for the entire territ cannot be agreed upon and launc but the majority of those present have come closest in contact with difficulties involved are of the o ion that for the present the wi course was followed. The merging all the organizations is the aim. chairman dismissed the meeting v expressions of confidence. "I feel," said, "that the dairy industry has en one of the greatest steps forw it has ever taken and I prophesy dairymen of New York State wil proud of the action taken here tod

Salvaging Milk Bottles

HOARD'S DAIRYMAN:—An expenditure of $500,000 is planned by the Milk Dealers' Bottle Exchange in Chicago for the erection and equipment of a modern plant to handle runaway milk bottles belonging to the 480 distributors owning membership in the exchange.

Organized in 1918, so efficiently has the work of the Exchange been extended that it is now estimated to save its members $1,500,000 a year in bottles which otherwise would be lost to their owners.

An average of 200,000 bottles a day is sorted out in the two present sorting stations. This is equivalent to ten freight car loads a day or a train of 60 cars a week. In summer the day's run mounts to 275,000 bottles. There are 100 employes on the payroll and fifteen trucks are engaged in conveying the bottles to their owners after being sorted in the plant.

About 30 per cent of the bottles handled daily are brought in by junk men who find them as they patrol Chicago's more than 50,000 miles of alleys where they have been thoughtlessly tossed. The other 70 per cent have worked their way into the wrong dairy from a dozen different causes. Under the rules of the association they must be sent back to the Exchange to be sorted out and returned to their rightful owners.

The Milk Dealers' Bottle Exchange is a co-operative organization, not for profit. Shares are sold at $10 each, based on the number of delivery wagons owned by a distributor. A charge of 1½ cents is made for each bottle returned to its owner. Junk dealers are paid half of this and the Exchange expenses are paid out of the other three-fourths cent.

Considerable quantities of bottles belonging to dealers in surrounding cities creep into Chicago. These are accumulated at the Exchange until sufficient to make their return profitable. Usually there is a load to be brought home from the outside town. Occasionally a bottle turns up in the day's run from London, Hong Kong, Buenos Aires, or other equally distant city.

Not long ago enough bottles belonging to milk dealers in Pittsburg, Pa., piled up to fill a car load. This suggests the activities of what the Exchange officials call "bottle bootleggers." Before the Chicago organization was perfected three car loads of Chicago owned bottles were being shipped out of the city every week by the "bootleggers" who obtained them from the junk men. The early tory of the Exchange is filled v stirring tales of efforts to break this unlawful trade. It has now b practically eliminated, it is believe

The new sorting plant will be a proof structure with a frontage about 650 feet. An up-to-date veyor system costing $50,000 has b designed which will facilitate sor and reduce costs. A bottle wash machine to cost $80,000 and belie to be the largest of its kind is als be specially built and installed.

All the large cities of the cour support bottle exchanges, but beca of the quantities handled in Chic this organization, according to Er Reuter, manager, is probably largest in the world.

CLOSE-UP VIEW OF THE MONUMENT ERECTED ON PICKARD BROS., OREGON, FARM JUST PRIOR TO THE RECENT DISPERSION OF THEIR FAMOUS JERSEY HERD

The 47 animals in the herd averaged $414. W. K. Keenan of New York paid the highest price, $2,600, for the world record cow, Darling's Jolly Lassie.—IVAN STEWART, Oregon.

P. A. was made-to-measure for me

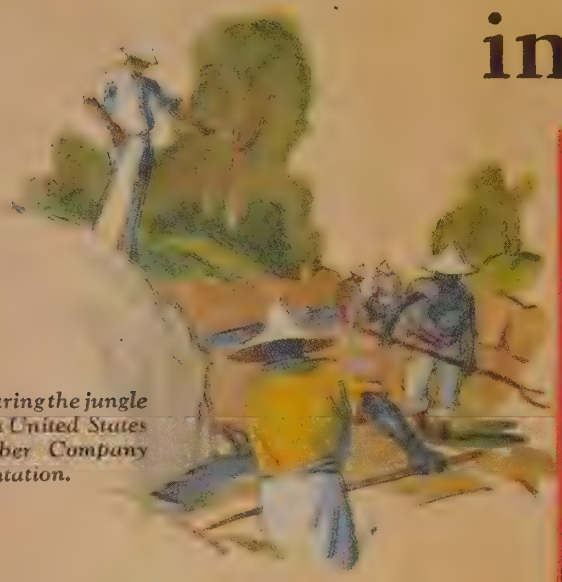
PRINCE ALBERT couldn't have suited me better if I had made the blueprints myself, and superintended the entire job from soup to nuts! It fitted my smoke-taste perfectly the first time I tried it. I started right — with P. A. — and I've stayed with it.

I wanted fragrance. I got it . . . both from the tobacco in the tidy red tin and in the smoke itself. Fragrance that reminded me of woodland trails just after a soft, spring rain. I wanted mildness—mildness that would let me smoke from morning till midnight.

But mildness alone was not enough. I demanded a full, rich tobacco body that would satisfy my pipe-hankering on every fire-up. There again Prince Albert had my measure, right to the tick of the tape. Cool, long-burning, free from bite and parch—P. A. was all of these.

You suspect by this time that I am satisfied with P. A. I'll tell the world I am! And I want to get it over to *you* that, if you don't know P. A. by personal experience, you've got something coming to you . . . something mighty good. Try P. A., on the word of a friend!

P. A. is sold everywhere in tidy red tins, pound and half-pound tin humidors, and pound crystal-glass humidors with sponge-moistener top. And always with every bit of bite and parch removed by the Prince Albert process.



PRINCE ALBERT

—no other tobacco is like it!

The Greatest Large-Scale Farmer in the World.....

Clearing the jungle for a United States Rubber Company Plantation.

Bud-grafting young stock. Each budded tree must be protected with a shield of leaves.

Picture a group of farms totaling 136,000 acres with 20,000 hands to work them. Consider that these farms had to be cleared from virgin jungle, drained, fertilized, prepared. That 10,000,000 trees have been grown from seed, set out, grafted. Consider, also, that these farms have whole villages within their borders, schools and hospitals. Docks of their own. 80 miles of railroad and 355 miles of motor roads. Picture this and you begin to get an idea of the greatest agricultural enterprise in the world—the Far Eastern rubber plantations of the United States Rubber Company.

This huge development has but one object—to make *certain* of an ever-increasing supply of the finest rubber that can be grown for United States Tires. And so to guarantee the users of United States Tires *quality* right through from the place where quality must start—the rubber from which the tires are built.

Get more for your money!

THE longer wear of United States Royal Cord Balloons begins with rubber *grown for quality.* But plantation ownership is only one of the important steps in producing these better tires.

To obtain tire cord of the quality its specifications demand, the United States Rubber Company operates its own *Cotton Mills* in the heart of the cotton fields.

And every Royal Cord Balloon incorporates three of the greatest forward steps ever made in tire building:

Sprayed Rubber—the purest, strongest and most uniform crude rubber known; *Web Cord*—the framework of the tire structure in which the cotton cords are bonded together with pure rubber latex without friction generating cross-tie threads; and the *Flat Band Method*—which assures a tire equally strong at every point.

Company-owned plantations and mills, new and better materials and methods—all mean *greater mileage* for tires. That is what you are interested in. *Get more for your money*—go to the dealer who sells United States Tires.

d New Sweet Clover Pasture

ast is the month when cows ned from the old sweet clover to the new growth of last s seeding, provided the old has at long enough and the new made satisfactory growth to pasturing. We would like to experiences of several dairy- no are trying this out. There e indication among those de- on sweet clover for pasture r seeding some sweet clover spring and turning the cows he old, spent pasture of the s year's seeding to the new of the seeding made last sweet clover may be depended supply pasturage about 5½ Just how well these two s fit together in August is a n that needs a more complete Write us your experience.

at Sow May Need More Feed

brood sow that is called on to two litters of pigs a year pecial attention. As a rule, ows are thin when spring lit- e weaned. They are bred after their pigs are weaned thin condition, many of them lost 60 to 80 lbs. in weight. s a tendency to let such sows t for themselves during the mmer season. They will do a ifting for themselves all right get enough of the right kind Otherwise they cannot bring rong pigs in September and more need for strong fall n is the case with spring pigs. ows are now well along in their pregnancy periods. Are they getting back the weight lost to their spring litters. Such sows should have at this time, in addition to pasture, a daily feed of grain equivalent to about two per cent of their live weights.

Broody Hens

Broody hens—what are we going to do with them? Each flock owner has his or her own notion of how to persuade broody hens to return to better behavior. If one has a sure-fire method of breaking up their desire to keep the nests warm, hang on to it for good methods are scarce. The best method we ever saw to give such hens something different to think about was an ordinary commercial crate hung off the ground by a single hanger attached to the center of the crate. When a few broody hens are put into a crate hung in this manner there is created an action resembling a combination of merry-go-round and tetter-totter. It's hard for hens to concentrate on hatching out chicks under such circumstances. The crate is lowered for feeding and watering the hens.

Proper Development of Pullets

August is a critical month in the development of pullets for future egg production. If one pushes them too rapidly, thereby bringing them into production in September, they are likely to molt before Christmas in which case winter production is out of the question. If one does not crowd them along rapidly enough, production will not begin until after cold weather begins in which case it is hard to get them up to satisfactory production until February and early March and then the price is declining. Pullets should be made to grow uniformly from hatching to maturity, without setback. Free range, an abundance of shade and green feed, combined with access to the proper growing mash in a self-feeder, will usually bring pullets up to laying time in the right condition for good winter production. August is a good time to check up on the development of pullets.

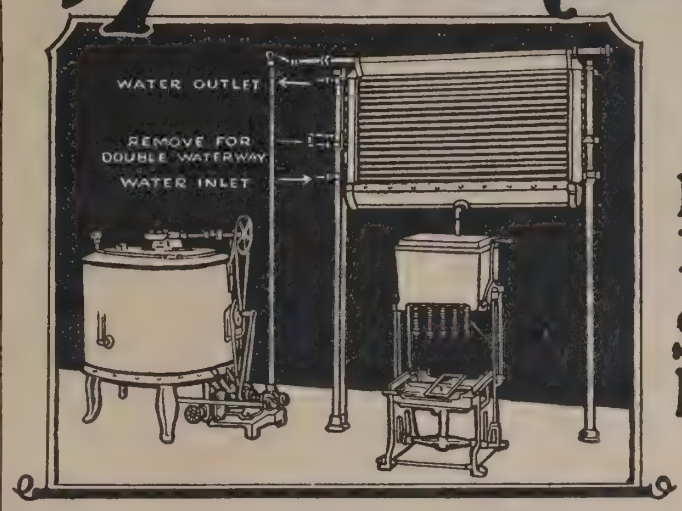
Noted Holstein Sire Dies



Sir Bess Ormsby Fobes, herd sire at Hollyhock Farms, Wisconsin, for seven years, and known the country over as one of the best of present day Holstein sires, died June 25. A son of S. P. O. M. 37th and Wisconsin Fobes, he was bred by John Erickson and sold to Hollyhock Farms by Schinke and Rabenhorst as a 3-year-old.

He has 33 A. R. O. daughters, only six tested at over three years. The first three mature daughters to complete 7-day records went to 34 lbs., 32 lbs., and 29 lbs. His first five 2-year-old daughters to be tested for a year averaged 640 lbs. fat, (800 lbs. butter.)

Sir Bess has always been known for his own good type and definite proof of his ability to transmit it is found in the grand champion female at the last National Dairy Show, one of his 4-year-old daughters. That cow now on year test has produced 560 lbs. fat, (700 lbs. butter) in her first six months.

"Sir Bess" leaves 45 daughters in the Hollyhock herd, with 11 cows still to freshen to his service.

VICTOR DAIRY PASTEURIZER

for the FARM DAIRY and SMALLER PLANTS

REALIZING the need for a simple, efficient and economical milk pasteurizing outfit for smaller plants and farm dairies, *CP* offers the Victor, illustrated above.

The outfit consists of a combined heater and holder, sanitary pump and Alaska cooler. (Bottle filler is not included, but can be supplied at extra cost.) Operation is simple and conforms with all state health boards' requirements.

With a Victor Outfit the small dairyman can produce good, wholesome pasteurized milk just as cheaply and efficiently as the big city dealer. Pasteurization provides safe milk and will increase your business. The Victor is a business builder. Write for full information and prices.

RUNNING WATER WITHOUT WORK

With a good Well and a good Windmill you can have all the water you want without work, worry or expense. Water from a well costs you nothing. The cost of an **Auto-Oiled Aermotor** is moderate. The expense for maintenance is so small that it need never be given a thought. An Aermotor runs in the lightest breeze. It will also work safely and steadily in the heavy winds.

The **Auto-Oiled Aermotor** is completely self-oiling. The double gears run in oil in a tightly enclosed gear case which holds a year's supply of oil. When the mill is running the oil circulates through every bearing. Every moving part is constantly and completely oiled. Friction and wear are practically eliminated.

Auto-Oiled Aermotors have behind them a long record of successful operation. Their merits are known the world over. For further information write

"Trade in" for a Power-Equipped Sharples SEPARATOR

You can trade in your old separator for a power-driven Sharples Tubular—you can trade it in on one of **larger capacity**, at very little cost. A power-driven separator costs only a little more than a hand-driven separator, and $20 allowance will be made on your old machine. If your separator is too small for your needs, if it is worn, out of balance and losing cream, and you want to be free from the drudgery of it all, write today for the Sharples offer, telling us what capacity you need.

$20 allowance on your old Separator

SHARPLES SEPARATOR CO., 565 W. Washington Blvd., CHICAGO, ILL. or WEST CHESTER, PA.

When buying mention Hoard's Dairyman to your merchant or dealer—it helps us!

Neighborly Notes

Yesterday, with my usual thrill of expectancy, I opened my mail and was rewarded by finding one of those delightful farmers' bulletins which the United States Department of Agriculture sends out. These same bulletins have provided a veritable well of knowledge for me the past year or two. I have been surprised to find that this department takes as great pleasure in helping the farmer's wife as the farmer himself.

It was quite by accident that I stumbled onto the real value of these bulletins. Of course, I, like everyone else, had heard of them for years but considered them as something very remote, as concerning myself at least. One day I chanced upon an exceptionally interesting article in a magazine that referred the reader to a bulletin on "Child Management," by D. A. Thom, M. D. As this happened to be a subject I was much interested in, I sent at once for this bulletin. I was amazed and delighted with it. I sent back for others and for a list of available bulletins. The list was staggering but also very promising. Subjects varied so that no matter what you were interested in you would find something meant just for you. There are a number of interesting booklets on flower culture if that happens to be your hobby. Although of late I have not sent for any special number, about every so often one of these extremely interesting little books comes into my home. Many of these bulletins are sent out entirely free of charge, though some have a charge of a few cents attached to them to cover printing and postage. Write to the U. S. Dept. of Agriculture, Washington, D. C., for these bulletins.

This particular bulletin, which arrived so recently, proved to be No. 1530 on "Fitting Dresses and Blouses." Now I have always sewed and consider myself as good along that line as the average housewife and yet I was astonished at the things I did not know when I looked over this little booklet. The bulletin deals with alternating and fitting of garments whether home-made, made by a dressmaker, or purchased ready made. It points out the loss from an economic point of view through the wearing of a garment that does not fit; so much dissatisfaction results from the wearing of an ill fitting garment that often it is cast aside long before it is all worn out. Very few women know how to alter patterns so that they will conform to their own figure. Manufacturers have used so-called "ideal" measurements as their basis in cutting patterns and garments. This bulletin helps the home dressmaker to remedy these conditions, and cut the goods and fit it to her own measurements. Each step in this work is illustrated so clearly by actual photographs that the reader cannot fail to grasp the point the writer tries to convey and the remedy for each trouble.

I have in my hands at present a bulletin on home conveniences, No. 927, which should be in every farm home in America, and inside the cover I find these lines, "Whatever lessens woman's work, benefits the race." Some day I will tell you more about this booklet, but at present I wish merely to mention a part of the table of contents: The kitchen cabinet; the fireless cooker; sponge box or bread raiser; dish drainer; heights of working surfaces; serving tray; folding ironing board; the iceless refrigerator; the cold box. Are you not anxious already for a copy of this to read?

"A Guide to Good Meals for the Junior Homemaker," (Miscellaneous Circular 49), takes up a study of the five food groups, how food supplies body needs, calories, etc. In fact it takes up work very similar to what is being taught in classes of domestic science in high school.

There is a whole booklet of fourteen pages in itself, just made up of a list of bulletins on foods and cooking, canning, cold storage, and home economics. This ranges all the way from Food and Drugs Act to ice cream, honey, laundering, and metabolism.

The canning bulletin which I have, No. 1471, covers all sorts of methods of canning: hot pack, cold pack, water bath canners, and pressure canners. It provides not only instructions for canning all sorts of fruits and vegetables but time tables as well.

Then for the person who knows little about fabrics and selection of cloth, I would recommend No. 1449. Or, if you are interested in the principles of window curtaining, send for No. 1516. This booklet is one of the most delightful I have ever received. It is full of the most interesting ideas for your windows. Just to look at the illustrations in this book is enough to fire one with enthusiasm.

This morning one of my friends called me up and said she had gotten a stain on some of her best linen and she simply could not get it off. Immediately I brought forth my Stain Removal Bulletin No. 1474. And within a half hour she reported that the stain had disappeared.

To quote from one of the bulletins: "The government of the United States is the greatest of all modern publishers. It employs thousands of scientists who are engaged the whole year round in making researches and investigations in all branches of agriculture and household economy, in geology, in mining, in electricity, in chemistry, in astronomy. The arts of war as well as those of peace are also cultivated. The greatest art of all, that of maintaining and spreading free government, is strenuously carried on by president, cabinet, senators, representatives, army, and navy.

"The results of all these activities of the most comprehensive and effective organization ever known are constantly reduced to print and poured out in an incessant flood from the Government Printing Office at Washington, the largest printing plant in the world."

Let us make use of this information that has been gathered for our benefit. We, who are farmers' wives, have little time to spend digging out such gold mines of information for ourselves, and so when the government has done this for us, has had this same information published in language simple enough for us all to understand, let us accept the knowledge thus available, knowledge that will lighten our work, gladden our play, and bring us help in many a way.—ETHEL MORRISON MARSDEN.

MRS. J. C. ALLEN, INDIANA, CANNING MUSTARD BY COLD PACK METHOD FOR WINTER GREENS

Importance of Eating Vegetables

The more scientists investigate, the more importance they attach to the value of vegetables in the diet; and the more psychologists investigate, the more importance they attach to learning to eat and enjoy vegetables when young. It is not only that the young child has a great need of vegetables but the chances are that if he does not learn to eat them when he is young, he will never eat them at all. Children are born without any natural likes or dislikes for foods but they acquire them with such uncanny subtlety that it seems they were born with them. They get used to milk and then spit out orange juice, not because they don't like it, but because it is different from milk which they have already got into the habit of taking and they don't want to change.

A survey made by some home economics people concerning the vegetables children like and eat showed that they, in the main, eat the vegetables their mothers cook and serve and that they learn to like the ones which they originally thought they disliked, if they kept on eating them

Wisconsin May Butter

isconsin co-operative creameries paid pro- rs a net price of 46.3 cents a pound for erfat in May according to reports from 80 hese creameries to the Wisconsin Depart- t of Markets. These creameries received average of 41.6 cents a pound for butter, ing spread of 4.7 cents between the price ived for butter and the price paid for fat. he range in prices paid for fat was from to 50 cents, with the price received for butter ranging from 40.1 to 42.5 cents. The overrun ranged from 21.7 to 23.9 per cent. Receipts of butterfat averaged 37,929 lbs. per creamery.

June Foreign Butter

The following table of foreign butter prices gives the average of weekly quotations as published by the U. S. Department of Agriculture:

Market	June 1927	May 1927	June 1926
	Cts.	Cts.	Cts.
New York	42.5	43.5	41.2
Chicago	40.4	41.5	39.1
Copenhagen	33.4	32.9	34.7
Berlin	33.5	33.7	35.2
London			
Danish	35.8	35.3	37.5
Dutch*	35.0	34.4	32.6
New Zealand	35.6	35.0	35.1
Australian	35.5	34.4	34.5
Argentine*	34.7	33.9	31.6
Siberian	34.2	33.3	31.2

*Unsalted.

June Cheese

Wholesale price of cheese on the Wisconsin boards averaged 22.5 cents for June, which is practically the same price as prevailed last month but exceeds a year ago by 2.6 cents. The first two weeks in July saw little change in prices, with the markets generally firm.

Cheese production for the first five months of the year totaled 144,572,000 lbs., a decrease of eleven million pounds from last year. Net imports were 30,518,000 lbs., an increase of ten million pounds over last year. Storage on June 1 was 35,780,000 lbs., a decrease of four million pounds from last year. This brings the total estimated trade output for these five months to 196,152,000 lbs., a decrease of 9.3 per cent in apparent consumption of cheese as compared with the same period last year.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese on the Wisconsin Primary Market during June:

	June 1927	May 1927	June 1926
	cents	cents	cents
Twins	22.2	21.9	19.3
Single Daisies	22.5	22.4	19.9
Longhorns	22.3	22.3	20.1
Square prints	22.8	22.9	20.3
*Receipts since Jan. 1	96,958	76,192	90,319
*Receipts for month	20,765	20,017	19,951
*Storage (End of months)	10,995	9,634	18,212

*In thousands of pounds at Chicago, New York, Boston, and Philadelphia (i. e.—000 omitted).

June Condensed Milk

(Report by U. S. Dept. of Agriculture)

Prices paid producers for 3.5% milk f. o. b. factory were as follows for June covering those factories manufacturing both case and bulk goods:

Geographic sections	No. of factories	Prices per cwt. Range	Ave.
New England	1	$2.02	$2.02
Middle Atlantic*	7	1.90—2.14	2.05
E. No. Central	57	1.70—2.04	1.91
W. No. Central	6	1.79—2.10	1.93
North Western	6	1.75	1.75
South Western	10	1.66—2.20	1.84
United States	90	1.66—2.20	1.91

*Sixty-one additional factories reported prices based in part on current month's wholesale butter quotation. Forty-seven factories reported prices not determined as yet and 20 reported factories closed.

Manufacturers' wholesale selling prices for sweetened condensed and unsweetened evaporated milk were as follows for May:

	Range	Ave.
Condensed, per case	$5.26— 6.55	$ 5.94
Condensed, per cwt.	9.25—13.00	10.31
Evaporated, per case	3.55— 5.20	4.43
Evaporated, per cwt.	6.45— 9.50	8.55
Condensed skim, per cwt.	4.55— 7.00	5.87
Evaporated skim, per cwt.	2.50— 5.38	3.57

June Butter

Butter averaged 42.5 cents in New York for June, a decline of one cent from the May average but still 1.3 cents above June a year ago and the same as two years ago. The first two weeks of July saw declines of one cent, but receivers appeared to have confidence and sent butter into storage at around 42 cents rather than push it on to the market at lower prices. Production has apparently reached its peak for this season and is now on the decline.

Creamery butter production for the first five months of the year was 582,920,000 lbs., an increase of eighteen million pounds over last year. Net imports for the same period were 4,339,000 lbs., an increase of four million pounds over last year. Storage holdings on June 1 were 25,340,000 lbs., a decrease of five million pounds from a year ago. This brings the estimated trade output for the first five months to 807,891,000 lbs., an increase of five million pounds or .7 per cent greater consumption than for a like period last year.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices on 92-score butter (extras) at four of the principal markets, together with receipts and storages:

The June butter in New York City averaged 42.5 cents, which is 1.3 cents over last year and practically the same as two years ago.

	June 1927	May 1927	June 1926
	cents	cents	cents
Chicago	40.4	41.5	39.1
New York	42.5	43.5	41.2
Boston	42.6	43.8	41.6
Philadelphia	43.2	44.3	42.1
*Receipts for month	74,223	62,211	72,570
*Receipts since Jan. 1	301,544	227,321	296,192
*Storage (end of month)	41,026	9,470	44,872

*In thousands of pounds at the four markets (i. e.—000 omitted). Ninety scere butter averaged 39.1 cents for June in Chicago, with centralized butter at this market selling for 40 cents. Jobbers' prices on extras sold to retailers averaged 42.9 cents in Chicago, a spread of 2.5c above wholesale.

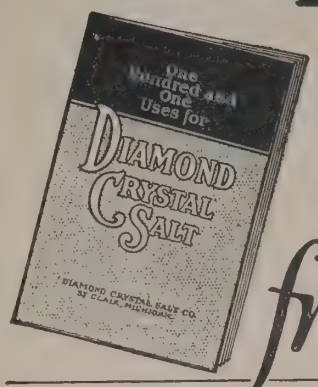
Milwaukee June Milk

The Milwaukee Co-operative Milk Producers announce the following prices for the month of June:

For the portion sold as fluid milk, $2.85 per cwt.; and for the portion manufactured, $1.70 per cwt. These prices apply to 3.5 per cent milk delivered f. o. b. city, four cents being added or subtracted for each one-tenth of one per cent variation in test. Sixty-three and one-half per cent of the total receipts were sold as fluid.

May Dry Milk

(From Report by U. S. Dept. of Agriculture)



The wholesale prices given below are based on reports from manufacturers governing actual sales f. o. b. factory during May:

Dry Skimmilk: Prices ranged from 7 cents to 11.5 cents for dry skimmilk in bulk, averaging 9.13 cents a pound for sales totaling 7,421,801 lbs. When packed in one-pound cans the price reported was 28.2 cents a pound.

Dry Whole Milk: Prices ranged from 24.5 cents to 27.5 cents for dry whole milk, aver-

IF YOU would know how generally useful salt can be around the home and farm, write today for the booklet, "101 Uses for Diamond Crystal Salt." We venture to say it suggests many that are entirely new to you.

Besides, it answers every question you may have about salt. Is Diamond Crystal different from ordinary salt? Is there an advantage in its flaky, snow-whiteness? When is salt mild to the taste and what effect has that on food? All these — and many more — questions can be answered and proved by reading this booklet. We shall be glad to send a copy to you.

Diamond Crystal is a pure, mild salt. It dissolves easily and blends readily with food. It emphasizes food flavors and does not obscure them.

There is a Diamond Crystal Salt for every farm use—for table and for cooking, for livestock, for curing meats, for canning, for butter and cheese-making. Ask for Diamond Crystal at the store where you trade.

"The Salt that's all Salt."

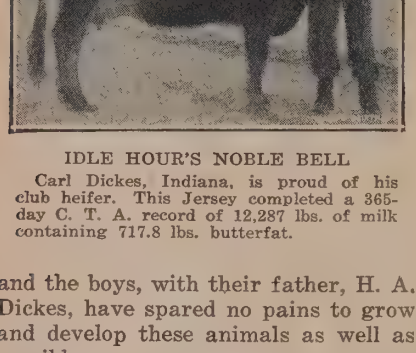
HOARD'S DAIRYMAN JUNIORS



A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Pure-breds and Club Work

HOARD'S DAIRYMAN JUNIORS:—Idle Hour's Noble Bell, a two-year-old Jersey heifer, has been the source of a great deal of satisfaction to her fifteen-year-old owner, Carl Dickes, Indiana, by the record she has made.

Noble's dam is Golden Gardo Bell, a heifer which Carl's brother secured through the calf club three years ago. Gardo was a bred heifer purchased in Ohio. These were the first registered females to come to the Dickes farm,

IDLE HOUR'S NOBLE BELL

Carl Dickes, Indiana, is proud of his club heifer. This Jersey completed a 365-day C. T. A. record of 12,287 lbs. of milk containing 717.8 lbs. butterfat.

and the boys, with their father, H. A. Dickes, have spared no pains to grow and develop these animals as well as possible.

The farm of H. A. Dickes & Sons has maintained a herd of dairy cows only a comparatively short time. Beef cattle formerly filled the stables. A registered Jersey sire has been purchased, and it is the desire of the father and his two sons to develop a herd of pure-breds from this foundation stock.

Indiana. G. A. WILLIAMS.

After Club Work, What?

I am wondering if hundreds of former club members are not unconsciously incorporating into their daily work things they were taught in their 4-H work—things that almost unknowingly are helping them to do their work more efficiently and are starting them on the road to success.

After club work, what? To one group it may mean leaving rural life for the bright lights of the city. It may be that these young folks have been taught just enough leadership and co-operation that they will develop into leaders of commerce and industry. It is my contention that if a person does not have a liking for farming, it is his duty to himself to get into another profession.

After club work, what? To another group it means stepping across the threshold of youth into the life of realities. The former club member who stays on the farm has an opportunity to put into practice what he learned in club work. In many backward communities club work has been the sole source of agricultural education.

After club work, what? We have a kind of unwritten law which asks that a club member give back to club work what he has taken out of it. There is no better source of club leaders than young people who came up through the ranks themselves. They can see things from the viewpoint of both the member and leader.

After club work, what? Many instances can be cited of club members who have built up a successful business just by carrying on their club project on a greater scale for their own benefit. Former club members can be of value to their communities by backing parent—teachers' associations, breed organizations, and community clubs.

[EDITOR'S NOTE:—The above was taken from a talk given before a group of club folks by George Price, a graduate of club work and a club leader, who is now farming with his father in Kenosha County, Wisconsin.]

Little Talks for Juniors

Work. A big, little word, isn't it? Sometimes it means fun and pleasure; sometimes drudgery, sometimes pain, sometimes money. But, whatever the meaning, it's a very necessary thing. We can't get along without it. Maybe it's just getting kindling for mother, or running an errand. Maybe it's a day of toil in the fields with father. When you grow older, work is your means of earning a living.

Work is a blessing. It keeps people busy, and busy people are not usually doing things they ought not to do. Time does not drag for busy people; on the contrary, the day is hardly long enough for them.

Every worthwhile thing depends on work. Every material thing is the result of work by someone, sometime, somewhere. Work builds homes, barns, skyscrapers, engines, automobiles, trains, electric lines, farm machinery. Work is necessary for successful crops, herds, and flocks. Work brings up families and makes citizens. Work feeds and clothes the world, and makes the wheels go round.

It takes work to achieve success, whether it's in club *work*, in farming, or in business. If you would be successful, WORK.

Humpty Dumpty, Clown

HOARD'S DAIRYMAN JUNIORS:—One of the men best known to the 4-H club members of California is Humpty Dumpty, the health clown. Every Saturday evening he talks over the farm radio to thousands of listeners. He conducts parties through health land and travels to the ice cream mountain in a milk plane.

Thousands of boys and girls and not a few older people have watched him perform at various state and county fairs. His magic milk stunt and his mechanical cow have entertained as well as enlightened, with the result that the per capita consumption of dairy products in California is higher than in any other state, in spite of

HUMPTY DUMPTY HEALTH CLOWN

the fact that the prices for these products are higher there than in the East.

Ray L. Law, for that is Humpty Dumpty's real name, is employed by the health department of the California Dairy Council, so he is giving all his time to the task of increasing the consumption of pure dairy foods as the surest method of bettering the health of the people.

Wisconsin. GUY A. PETERSON.

Opportunity—Service

"Opportunity" has been the th back of the exhibit for the last years at Camp Vail for the 4-H members at the Eastern States position, Springfield, Massachus

It can be truthfully said that t is opportunity for all boys and no matter where they live if t but search it out. Tacked on all sides of every post in the exhibi hall last fall was a card which "4-H Club Work Means Opport ty." Each exhibit booth represe either the opportunity that had seized by some individual club m ber or a group of club members.

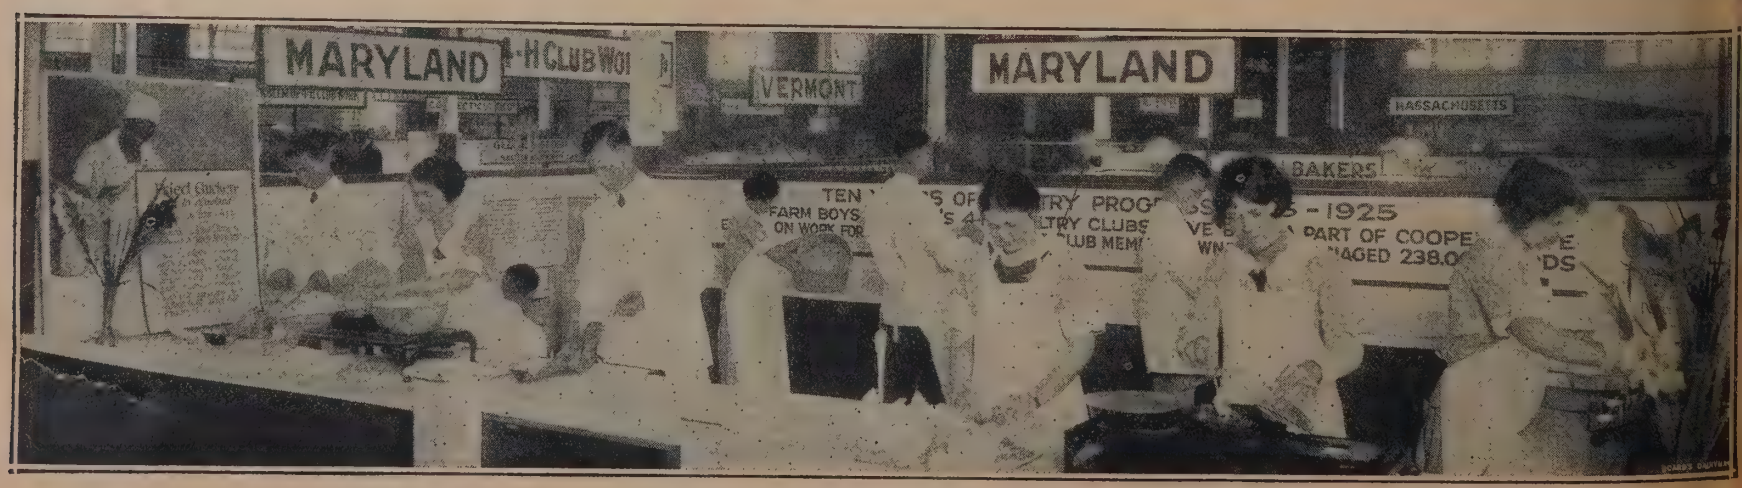
For instance, the West Virg group did weaving of basketry, the material used was all grown the state.

The Vermont delegation made ple sugar. The young people of county of that state have learne pack neatly in a pound box, wit 4-H Club card, maple sugar w they have sent around the world.

The Pennsylvania boys brought tatoes raised in Pennsylvania, ba them and served them hot with p ty of butter and salt.

Rhode Island showed how work offers opportunity to dev the Health H. Each state made exhibit illustrative of opportunity

Service has been the watchw throughout the last several years, best of all there developed with exhibit itself this year a chance serve.



Maine had a clothing booth and girls mended, patched, and pres clothing for girls in the camp.

New York, with a splendid bo showed how a farm shop should set up and equipped, and the b did odd jobs about the exh throughout the week. To illust their willingness to serve, a st used for milking goats, belonging one of the Connecticut booths, wrecked in transportation. The N York boys used a photograph built another which was used dur the week.

Young people coming to Ca Vail are impressed with the idea t it is for them to return in service honor which has been paid them w they were invited to be guests of Exposition Management.

They are made to feel that exhibit is a great show window 4-H Club Work and they, as part that exhibit, are there to make t exhibit as fine as possible.

ar feature of the junior department, the contents of Hoard's Dairyman evious issue. Let's talk it over.]

e July 10th issue begins a
f articles on the "Life and
T. L. Haecker."
s T. L. Haecker? Since 1918
been professor emeritus of
at the University of Minne-
e is known as the father of
in the Gopher State and his
efforts for co-operation and
tigations in dairy cattle feed-
well known.
was he born? In a little log
Medina County, Ohio, the
hild in a family of twelve
4, 1846. He is now 81 years

**and when did he start farm-
himself?** When Haecker was
old his family settled on a
Cottage Grove, Wisconsin.
Haecker was educated in the
school and at the University
nsin. He served in the Civil
in February, 1874, returned
ge Grove and commenced
on his own account. (See
6.)
**does the business record on
le Stock Farm show?** This
Iowa farm operated by
. Hormel, maintaining a herd
de Guernseys and marketing
from 150 to 200 hogs, shows
fit for the past five years of
, or an average annual net
$1,694.49. (See pages 687
)
**does Hormel say about keep-
records?** "I sincerely be-
t with the aid of our ac-
nd production records, we
le more progress in the first
five years of our work than we could possibly have made in ten years without them. We do not think our records extraordinary. They help point out the mistakes and they are proof of the value of good practices we have discovered and adopted."

How can lice on poultry be treated at culling time? After examination dust a pinch of sodium fluoride under each wing and around the vent of those birds to be retained in the flock. (See page 689.)

How can egg collections on the farm be made easier? By keeping the flock confined to the house until noon or shortly after. This discourages stealing nests. (See page 711.)

How can the appearance of eggs be improved? By confining the flock a few days after heavy rains. Some litter on the floor during the summer will allow the hens to keep their feet cleaner and produce better appearing eggs.

Junior Letters

Climbing in Club Work

Hoard's Dairyman Juniors:—We have taken Hoard's Dairyman for four years. I can hardly wait until it comes because I like to read the junior page. I am sixteen years old and going to the Eau Claire high school.

I belong to a calf club. The name of the club is Pleasant Valley—Brunswick 4-H calf club. Our club has been organized two years. We have had fifteen members every year. Our club took 3rd prize in club groups down at the county fair the first year and last fall our club group took second. Next fall we are going to try to take first. "Make the Best Better."

I also have a sister in club work too. She is fourteen years old. She is the secretary-treasurer of our club. I have a brother 10 years old and he is trying hard to join our club this year. We have our club meetings once a month. Mr. Stauss, our County Agent, helped us get organized. Mr. Burke, a club leader, helped us from May to September last year. I am hoping to hear from some juniors. My address is R. 3, Eau Claire, Wisconsin.

Alice Erickson.

Wins in Club Judging

Hoard's Dairyman Juniors:—I was seventeen years old the 27th of March and live at Persimmon Grove, Kentucky. I have been a club member for six years and won in the Kentucky state champion live stock judging team of 1926 at Louisville, Kentucky, and sure was proud of the work our team did. I was the second highest individual judge. There were 186 contestants. Our team entered the International Live Stock Show at Chicago which was held November 27 to December 4, 1926. Our team won second place in judging draft horses.

I live on a farm of 113 acres. We have 12 milk cows, and 46 sheep; also hogs, chickens, horses, and a dog. We have all Holstein cows but two and they are my sister's and mine. We have a radio in our home which we enjoy very much. My address is R. 1, Alexandria, Kentucky.

Helen Gertrude Schafer.

My Pig "Spot"

Hoard's Dairyman Juniors:—This is my second year in the Pig Club. I like the work very much as I am fond of stock, especially pigs. I bought my pig from my father when she was about two months old. I gave six dollars for her. She weighed about sixty pounds. She had a white spot on her hip so I named her "Spot." Daddy said if I would take good care of her he would give me the feed.

She weighed 162 lbs. at six months when I sold her to my uncle, George Hazzard, for fourteen cents a pound, bringing me a total of $22.68. Deducting the $6, the cost of my pig, with no other expenses, netted me a neat profit of $16.68 to go on my bank account.

This is what I have learned about raising Poland-China hogs. As long as you can keep the curl in their tails and their ears lopped down you can be sure Piggy is on the incline "Pork going up." I am 10 years old. My address is Winnebago, Illinois.

Emerson Whitney.

Raising Cotton in Texas

Hoard's Dairyman Juniors:—I live in the southern portion of Texas where we raise cotton, corn, sorghum, sunflowers, and a few other grains. Some of the northern juniors may be interested to know a little about cotton. It is usually planted in April when the weather is warm, in rows like corn. It comes up in five or six days, and is hoed and plowed as often as necessary.

When the cotton is from two to three months old it begins to set squares, or buds, which when full grown open into beautiful large white blossoms. These blossoms remain open for only one day. In the evening they turn pink, then red and soon drop off and leave visible a tiny boll. The bolls when full grown are about the size of a hen's egg, but when they open they are the size of a cup or larger. When a field of cotton is open it looks like one large fluffy cotton ball.

Sixteen hundred pounds of cotton is called a bale. In this black and bottom soil, cotton grows to the average height of four or five feet. Yes, I can pick cotton too, but when I'm dressed in my knicker suit and big Mexican sombrero, I help with nearly all kinds of field work.

There are no large dairies here and very few small ones. Most people keep only enough cows to supply milk and butter for their own use. On our farm we have fourteen grade Jersey cows, eleven of which are being milked at the present time. My address is Sealy, Texas.

Alice Billig.

Dairying in Virginia

Hoard's Dairyman Juniors:—I live on a large dairy farm of 280 acres. I help dad milk and I really think it is fun to milk. I milk eight cows night and morning. I also help to feed the calves and I think that is more fun than anything else. We are in one of the greatest dairying sections of Virginia. We are about one and one-half miles from the railroad. I am in the third year high school and my books are my greatest friends. I am very much interested in laboratory work.

I am sending you a brief record of dad's best grade Guernsey cow for 1926. I milked her all the year. She gave 541 lbs. of butterfat and 11,063 lbs. of milk. The profit above feed cost was $372.85. I am very proud of her record. I wish some of the other juniors would write to me. My address is R. 1, Ashburn, Virginia.

Elizabeth Wright.

From Beef to Dairying

Hoard's Dairyman Juniors:—I was in the baby beef club last year. It was my first year in club work. I took mine to the county fair. He was younger than the rest, but I got 6th prize. I went to the state fair but did not get a prize. He was sold down there for $120.00. This year I am going to join the dairy calf club. My address is R. 3, Box 12, Britton, South Dakota.

Evelyn Mae Johnson.

You can't beat Burch's Best Cow Blankets

PATENTED MAY 19, 1925—No 1538596—

No Sir! There's not a cow blanket made that equals "Burch's Best." Hundreds of fine herd owners cover their winners with this patented blanket. Has ten exclusive features. Combines beauty, praticability and low price. Made to fit every animal perfectly. Every blanket covered with

Our Ironclad Guarantee

We guarantee them not to rip or tear for two years. You *must* get perfect service. No other blanket is so fully covered. None can be, for none are made so well. Well send a sample on request to convince you.

Where Burch Blankets Will Be Used This Year

These herds will use Burch Blankets this year: Carnation Farms and Pabst Holstein Farms, Oconomowoc, Wisc., Corium Farm, (F. J. Rueping, Pres.) Fond du Lac, Wisc., Fern-Dell Farm (A. W. Fox, Mgr.) Green Bay, Wisc., Elm Hill Farm, Brookfield, Mass., Rock County Herd, Janesville, Wisc., and many others.

Dairy Market News

(Continued from page 739)

26.17 cents for sales totaling 431,404 hen packed in one-pound cans the price d was 46.7 cents a pound.

Buttermilk: Prices ranged from 6.5 to 10.5 cents for dry buttermilk in veraging 8.69 cents a pound for sales g 3,264,077 lbs. When packed in one- cans the price reported was 10.98 cents d.

consin June Condensery Prices

y-two condenseries reported to the Wis- Department of Markets the prices paid he per hundred pounds milk delivered r factories. Reduced to a common 3.5 nt test basis, these prices ranged from to $2.40, the average being $1.95.

en factories sent delayed reports for he average being $2.05. This is four above the previously reported average l for 44 factories.

iladelphia Milk Prices

Inter-state Milk Producers' Association ces that the July basic price for milk $3.29 f. o. b. Philadelphia and $2.71 ndred at receiving stations in 51—60- ne.

June surplus prices were $2.19 first and $1.85 second surplus f. o. b. Phil- a. The June surplus prices at all re- stations on railroad were $1.61 first and $1.27 second surplus.

e are based on milk testing 3 per cent at with a differential of 2 cents for alf point of test up or down.

old Storage Holdings

. S. Department of Agriculture)

following is a report of the cold stor- ldings of dairy products on July, figures given in thousands of pounds (000 t):

	July 1 5-yr. av.	July 1 1926	July 1 1927
	lbs.	lbs.	lbs.
creamery	70,989	86,897	90,116
American	43,148	54,069	49,643
Swiss	3,894	4,465	5,223
Brick	1,998	1,906	1,991
Limburger	879	1,277	1,575
all other	7,038	7,054	8,387

e holdings include stocks in both cold warehouses and packing house plants.

ucing the Bacteria Count

ARD'S DAIRYMAN:—"What we know won't hurt us," is an old familiar statement, but if widely d is rather a flimsy rope to on in this day of bacterial ity.

e day a friend asked me to take with him into the country. His d took him to a certain dairy situated about 50 miles from ty. While he was engaged with roprietor I took the opportunity ake a careful inspection of the . On the way home my host me what I thought of the dairy. wered, "Well, I've seen a good dirty dairies but that one is the st and most disgustingly filthy I was ever in."

es, and you're drinking the milk that dairy at the —— Hotel," swered.

edless to say that I have not eat- en a single meal in that wonderful dining room since. No doubt I had carried away billions of bacteria in my stomach many times and so far as I know they did not hurt me. At the same time I certainly do not owe my good health to either the hotel management or to the owner of that dirty dairy. I escaped but I was only one of thousands who were drinking that unspeakably filthy milk on faith. Did they all escape, too? Or, how many deaths and epidemics could be traced to that dairy if all the facts were known?

Among the farm enterprises of which I have general control is a dairy of 225 cows with a yearly average of 183 milked daily. Our bacteria counts, made twice a month, averaged less than 10,000 per c. c. for the calendar year 1926. From this experience alone, therefore, I know that filthy milk production and conscienceless distribution is an unpardonable offense against a trusting public and that good, wholesome milk can be produced in most dairies where ordinary intelligent care is exercised. Our program is quite simple:

We begin milking at 3:00 a. m. Each milker has 16 cows in his line and is expected to keep his own cows clean. Beyond that he does no other work except to give the cows their hay and shake down the bedding when the milking is finished. During the milking the man who has charge of the feeding measures out the beet pulp and concentrates. We would like to eliminate all other work while the milking is being done but with a large herd and with our help this is not always possible. By 6:30 the milking is done and by 7:00 the milkers are all gone to breakfast and to rest until noon. After 7:00 the cows are turned out, if the weather is not too severe, and the stables thoroughly cleaned. What manure has accumulated since the night man went off duty is cleaned out, the bedding pushed forward toward the mangers, the mangers swept, the stanchions dusted, and floors, gutters, and mangers flushed out with a hose. Before the cows come in at noon the silage is put into the feed troughs and the hay, to be fed as soon as the milking is done, is placed conveniently without the bales being opened.

Promptly at 12:00 o'clock the cows are brought in and during the next 55 minutes they are curried, brushed, and have their tails washed. While this is going on, new bedding for the night is brought in and distributed along the passageway between the gutters where the bales are left unopened until the milking is done. As each milker finishes preparing his cows for milking he goes into his locker and changes from overalls to a white suit and cap. At 12:55 the afternoon milking begins, and by 3:30 the milk has gone by truck to the creamery.

The buckets used are covered excepting a 6-inch opening which is provided with a short, flared spout, or funnel. Before beginning to milk each udder is wiped off with a clean, damp towel. About every 3 months the hind quarters of the cows, including udders, tails, and flanks, are clipped.

Our aim is to have our cows so clean while they are being milked that there is no dust or hair to fall into the milk, and dry-hand milking is strictly observed. Every operation that tends to stir up dust is eliminated as completely as possible during the milking. While we are not producing certified milk we take pride in feeling that our product is in the certified milk class, that we are not afraid to drink it ourselves, and that our patrons are not suffering through any willful negligence on our part.

DAVID A. BRODIE.

District of Columbia.

RNATION WALKER HAZELWOOD

is Holstein cow has just broken two world's records by producing 34.58 fat (43.23 lbs. butter) from 627 lbs. in 7 days and 127.6 lbs. fat (159.56 butter) from 2,732.3 lbs. milk in 30 as a senior 3-year-old. As a junior ar-old this heifer established a new d's record for 365 days with a produc- of 976 lbs. fat (1,220 lbs. butter). ation Walker Hazelwood was bred is owned by Carnation Milk Farms, hington.

Importance of Eating Vegetables

(Continued from page 738)

on the supposition that they were good for them.

Spinach is one of the difficult vegetables as it is so healthful and yet so many children have the idea that they do not like it. The home economics people who made the survey have worked out some vegetable recipes that may interest you, as they were made with a view to catering to the whims of difficult children.

Glazed Carrots

Wash and scrape eight medium size carrots, parboil for ten minutes in boiling salted water, cut in thick, lengthwise slices and put in buttered pan. Make a syrup by boiling together for three minutes one-half cup sugar and one-fourth cup water. Pour syrup over carrots and bake till tender, basting several times.

Cabbage au Gratin

1 small cabbage
1 pint white sauce made with 3 tablespoons butter or bacon fat, 3 tablespoons flour, and 1 pint milk
1 teaspoon salt
¾ cup grated cheese
½ cup buttered crumbs.

Arrange cabbage and cheese in alternate layers in a baking dish, add hot sauce, then crumbs, and bake in a moderate oven.

There are many ways to cook spinach and once a child has learned to like it he will eat it with relish no matter how it is prepared. One of the most important things about spinach is to be sure to get all the grit out of it; sand in food is enough to deter anyone from eating it.

The simplest way to cook spinach or any of its substitutes, such as beet tops, turnip tops, dandelion leaves, or chard is to wring all the water out of it that you can and then cook it in a closely covered vessel. This method wastes the least juice. This juice, by the way, is delicious made into a cream soup. The commonest way of serving spinach is with salt and some kind of fat mixed into it hot, and vinegar or lemon juice put on when it is eaten. Or, you can add bits of hard-cooked bacon, or ground ham, or cheese, or simply a white sauce. Or, you can make a hearty dish out of it by taking steamed chopped spinach, making nests in it for the number of people you have to serve, placing an egg in each nest and baking until the eggs are done.—LUCY THOMPSON.

An extracting dentist says that he had an absent minded motorist in his chair the other day. "Will you take gas?" he asked. "Yeah," replied the a. m. patient, "and you'd better look at the oil, too."—Boston Transcript.

Your Neighbor Has a PAPEC Ask Him!

"The Cutter That Does Not Clog"

"I AM well pleased with the N-13 Papec purchased this year," wrote H. B. Austin, Oct. 8, 1925. "It has never clogged the pipe once and runs so light. It will cut and elevate twice as much as any cutter that I ever saw. The feed roll is a great thing, no stopping of bundles on the feed table."

Light draft, low operating cost and long life make the Papec the most economical cutter. There's a size to fit your power plant, whether you use a 3 h. p. gasoline engine, a light or a heavy tractor. If you have a silo, a Papec will earn you big returns. Let us show you how.

3 Ways to Make Money on Summer Feeding

1. *Feeding the Dry Cow*
2. *Feeding the Dairy Heifer, and*
3. FEEDING THE MILKING HERD.

"Feed a grain ration in summer" is the slogan today in the leading dairy districts. And almost invariably these summer rations include Linseed Meal.

Mail the Coupon for This Free Booklet.

Why are these prosperous farmers no longer satisfied with pasture alone, in summer? Because a richer ration — with Linseed Meal — pays immediate profits and gives a double return through building up the vitality of cows for high milk production in fall and winter.

Now is the time that counts! This free booklet shows you how summer feeding affects your whole year's profits. Includes practical summer rations to fit in with other feeds used in your district.

Ohio Judging School

During the past few years the breed associations, showmen, and judges have recognized the need of standardizing so far as possible the placing of live stock in our show rings. While it will never be possible to eliminate the personal factor, yet it is desirable to establish a great many points which are now handled in a variable manner by different judges. With this idea in mind, the Animal Husbandry Department of Ohio State University has been offering a judging school to the breeders and judges of Ohio. Two types of live stock are considered each year. One year beef cattle and hogs are studied and the next year sheep and dairy cattle are studied.

On June 22 and 23 this year sheep and dairy cattle were studied. There were about 70 attending the sheep school and about 100 attending the dairy cattle school. Quite a number of breeders and judges attended both.

The dairy cattle school was devoted to four breeds of dairy cattle—Jerseys, Guernseys, Holsteins, and Ayrshires.

Professor J. C. McNutt, of New Hampshire University, worked with all the breeds and was assisted by N. H. Hill of Ohio in the Guernsey classes and by Howard C. Barker of Ohio in the Holstein classes.

During the entire school there was a tendency to frank and free discussion and some very interesting points were brought out.

It is hoped by some that in the future the school may develop more of an official character which may lead to the certification of judges for county fair work.

Ohio. C. L. BLACKMAN.

What Corn for Silage?

There is a wide difference of opinion as to the best variety of corn for silage. Some prefer a corn that will make a large tonnage, irrespective of time of maturity, while others prefer a corn that will mature early and produce a high per cent of grain. Still others wish their corn principally to develop foliage—planting it thick, so it will produce little or no ears but much foliage. A good many experiments and tests have been conducted along this line, and while there have been some valuable findings, still no definite conclusions have been arrived at.

In states where the European corn borer is operating, farmers are urged to plant an early maturing corn for silage; also they should harvest the corn as soon as they can in the fall. They are urged to do this because the corn borer harboring in the stalks works down as the season advances, and the early maturing variety can be harvested and put in the silo before the borers have reached the low stubble section of the stalk. In this way practically all borers can be destroyed, and at the same time practically all of the crop can be harvested and put to valuable use.

I recall when we first started growing corn for the silo, back in 1886 and '87, we used a southern variety which grew to a great height and produced an abundance of forage. This corn, however, did not prove the best for our vicinity because it contained a high per cent of water and produced a very acid silage due to the lack of maturity at the time of harvesting. Later we tried a quick maturing Flint corn and got much better results; also we used a rank growing sweet corn which made excellent silage, especially when allowed to mature. A good many dairymen have found the large, vigorous-growing sweet corn which produces abundance of foliage a most excellent plant for filling the silo.

With all the varied ideas regarding this subject, perhaps the majority will admit that the corn which yields the best in their locality is the best corn for silage, and most silo users insist that the corn shall reach at least the dough stage before it is harvested. Another good suggestion is to select a variety that will be sure to mature before frost. By maturity I mean to reach that stage of development when the corn is right for the silo, and this is, as a rule, the time when the corn is ready to cut and shock. In extreme northern sections and in high altitude districts, corn often becomes a questionable plant for the silo, and without doubt Russian sunflowers have proven the best substitute. In fact many prefer sunflowers to corn where there is any question of early frost. In the northern dairy states early maturing dent varieties are the most popular for use in the silo. Our corn breeders have been doing excellent work in developing new varieties and strains that will mature early and will yield well even in our northern states. Of course such varieties should make the best and safest crop for the silo.

Sorghum and kaffir corn are proving the best plants in many of the south and western sections, especially where prolonged drouth is liable to occur. In Missouri, Kansas, Oklahoma, as well as Western Nebraska, sorghum cane has proven a most excellent silage plant. While any saccharine or corn-like plant will make silage, a good, vigorous variety of corn that will produce an abundance of forage as well as a good ear and mature reasonably early, is to be preferred.—A. L. HAECKER.

falfa Best Pasture for Pigs

e July would seem to be a poor o say anything about pig pas- but frequently when one has a reminder of something badly i he gives it a second thought. xcuse for mentioning this sub- ow is to put in a good lick for pig pastures next year.

Montana Station reports a rison of alfalfa, medium red , rape, rape and oats, oats, and as pasture for pigs. The feed- al was evidently planned to aid who are out of the corn belt ho must depend on other car- eous feed because barley is the used in the comparison. This to interest a good many of our 's who can grow forage and grain but not corn.

order to make the comparison on the basis of pasture crops, orm amount of barley was fed h pasture crop. This was at te of 2 lbs. of barley per hun- ounds of live weight daily or is termed a 2 per cent grain g. The following table gives the of the trial:

	Kinds of pasture					
	Alfalfa	Medium red clover	Rape	Rape and oats	Oats	Barley
of pigs per acre	17	17	18	14	14	14
of pasture season (days)	137	115	100	100	77	77
fed per 100 lbs. live weight .)	2	2	2	2	2	2
fed per pound gain (lbs.)	2.10	2.64	2.43	3.14	2.81	3.06
daily gains per head (lbs.)	0.60	0.34	0.45	0.43	0.47	0.42
barley and pasture per 100 gain	$8.00	$10.80	$9.93	$12.94	$12.37	$13.60
per pig on labor and in- ment	$3.81	$1.10	$1.23	$0.03	$0.23	$0.19
per acre after deducting of grain eaten	$92.87	$50.36	$39.95	$21.40	$23.20	$17.28

lfalfa pasture, $20 to $25 per acre, depending on yield.
lover pasture, $20 to $25 per acre, depending on yield.
ape pasture, $18.50 for rent and putting in crop.
ape and oats pasture, $21 for rent and putting in crop.
at pasture, $20 for rent and putting in crop.
arley pasture, $20 for rent and putting in crop.
arley, $3.00 per hundredweight.
alue of gains, $13 per hundredweight.

that alfalfa, red clover, and the order named are the best crops. Alfalfa has a big ad- e in length of pasture season. ily gain was very satisfactory rape and oats, the oats, and rley pastures, but the pasture is short and the carrying ca- lower than for the other An acre of alfalfa turned into worth of pork is something thinking about. Of course, ay not sell for $13 a hundred ar, but whatever the figure is , by comparison, is a mighty asture for hogs.

r finding out by actual trial was the best pasture, another trial was made to determine it rate the barley should be hree lots of pigs were fed on pasture. One lot received a r cent grain feeding or 1 lb. ley per hundred pounds live weight daily; a second lot was fed 2 lbs.; and a third, 3 lbs. of barley for each 100 lbs. of live weight. The daily gains were in direct ratio to the amount of barley fed, they being .43 lb., .60 lb., and .73 lb. per pig daily for the 1, 2, and 3 lbs. of barley fed. The cost of barley and pasture for 100 lbs. gain when 1 lb. of barley was fed daily per hundred pounds of live weight was $6.26; when 2 lbs. of barley were fed the cost was $8; and where 3 lbs. were fed it was $9.78.

With plenty of pasture available cheaper gains may be made by limiting the grain fed, but with limited pasture it seems advisable to feed at least 2 lbs. of grain daily per hundred pounds live weight.

Building Bone From Skimmilk

Swine producers are always interested in good bone formation in pigs, particularly in those retained for breeding purposes. An interesting experiment is reported by the Ohio Station along this line. The rations fed were corn alone, and corn supplemented by soy beans, wheat middlings, linseed meal, tankage, and skimmilk. When the bones of the pigs in the different lots were examined for size and texture it was found that corn supplemented with skimmilk produced not only the most bone but the strongest bone. The other rations were in the order as follows: corn and tankage; corn and linseed meal; corn alone; corn and middlings; and corn and soy beans.

A conclusion of the experiment is that rations of cereals alone will not produce normal growth of bone.

Sunshine Increased Gain

According to a feeding trial recently reported by the Ohio Station, sunshine has a measurable effect on the gains pigs will make when compared with pigs fed the same ration but deprived of sunlight.

The ration fed to the two lots of pigs was composed of corn, tankage, salt, limestone, and linseed meal. The pigs deprived of sunshine gained 1.02 lbs. daily at a feed cost of $6.22 per hundred pounds gain. The pigs that were similarly fed but exposed to sunshine gained 1.2 lbs. daily at a feed cost of $5.88 per hundred pounds gain.

Linseed Meal for Pigs

The addition of linseed meal to a ration of corn, tankage, salt, and limestone increased the rate of gain of pigs from .75 lb. daily to 1.02 lbs. daily and reduced the cost per hundred pounds gain from $6.45 to $6.22 in an Ohio feeding trial reported at the Ohio live stock day June 4.

The pigs that did not have linseed meal consumed 421.1 lbs. of feed per hundred pounds gain whereas the pigs having linseed meal consumed only 406.4 lbs. Fourteen and six-tenths pounds of linseed meal replaced 10.5 lbs. of tankage for each hundred pounds gain.

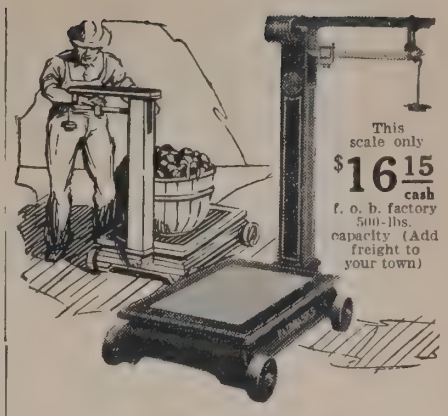
Many a good litter of pigs has been handicapped from the start because their owner did not have things ready when they came. Neglect at this time is just like taking money out of one pocket and putting it into another pocket with a hole in it. It's not too early to begin thinking about a safe place for fall pigs to be born.

Vacation Time in Cowland

(Continued from page 723)

two weeks equal parts of wheat bran, ground oats, and linseed oil meal make a splendid mixture. The daily feed should be reduced considerably. There is no limit to the amount of good legume hay a cow may consume at this time; when silage is used it may be well to reduce the consumption to about half of the usual amount. Just before calving a pail of warm water with a handful or two of wheat bran meets the needs of the cow; heavy feeding should be avoided. If the bowels are a little sluggish a dose of Epsom salts should be given.

The advisability of milking a cow before freshening is sometimes raised. There seems to be a very intimate connection between the udder and the reproductive organs at this time. Cows milked previous to calving often are more subject to retained afterbirth than if they are not milked. Then, again, if there is any possibility of milk fever this condition is intensified.



When the first signs of calving appear the cow should be placed in a clean, thoroughly disinfected box stall. It is well to have an attendant on hand in case normal delivery does not develop. A slight pressure at the proper time may save the cow considerable distress. With this exception it is best to leave the cow as quiet as possible.

The importance of the dry period as a factor in the making of good yearly records is becoming better understood through a study of cow testing association records. The cow secretes comparatively large amounts of mineral each year in her milk. Frequently the ration received during the winter months is low in this material. Unless she is given a dry period of six or eight weeks to add to supplies stored in her body, her system is called upon to meet the deficiency. The period of non-production may lessen the record a little that lactation but if the cow is a heavy producer and receives a good ration while dry she will materially increase her production the next year.

Happy is the dairyman who, while directing each silver arrow of milk into the white foamy mass in the pail, is sufficiently familiar with his herd to "tune in" on some blustery fall evening and catch a melody somewhat as follows:

"When the pasture season's over
And we're sheltered in the barn,
When the mows hold tons of clover
And the silo's filled with corn,
We begin a new lactation
After six weeks' good vacation.
Sixty days were not too many—
We will make it up next year.
(Some poor things do not get any
But it costs their owners dear)
If you give us cows no rest
We can never do our best."

It is a good thing to be rich and a good thing to be strong; but it is a better thing to be beloved of many friends.—EURIPIDES.

"Makeshift Measure"

has no place on the farm

NOWADAYS every modern-minded farmer considers his farm a factory that produces with labor and machinery the same as city plants. He takes a tip from big manufacturing methods and measures everything *by weight.* He takes no chances of losing part of his profit by "makeshift" measuring or guessing. His scale helps him account for every penny.

With a low cost Fairbanks Portable Scale on your farm you can check the weight of everything you buy and sell—feed your stock properly weighed rations—mix your fertilizers accurately. A hundred times a week you will find use for this scale—and you will stop the little losses that quickly mount to big sums.

You can obtain a genuine Fairbanks Scale from your dealer at the low price shown above. Large Fairbanks production permits the biggest scale value Fairbanks ever has offered.

Poultry on the Dairy Farm

Milk for Poultry

HOARD'S DAIRYMAN:—Some time ago we noticed this article in one of your papers:

"A hundred pounds of skimmilk is estimated to be worth six times the market price of a pound, live weight, of hogs or half the market price of a bushel of corn when fed to hogs. It is worth more than this when fed to young calves, chickens, pigs, or colts."

We are interested in feeding chickens. Our chickens here are marketed at the age of six months, and we are anxious to know what the feed value of buttermilk is compared to solid feeds to chickens from three days to six months of age, and also for laying hens. We would like to know what other rations are the most suitable to use with buttermilk. There seems to be considerable controversy in this locality in regard to buttermilk as a food for chickens. Any information that you can give us will be very much appreciated.

California. N. O. CREAMERY.

It is a mighty hard proposition to give a definite answer to this question concerning the food value of milk, although a lot of experiments have been conducted. It is the simplest thing in the world to turn to experiments at Purdue, Kentucky, or a number of other places and show the absolute necessity of animal protein feed being combined as a part of the ration for most economical returns. In other words, although this material seems to be rather high in price the fact that it is combined as part of the ration tends to lower the cost of production.

One of the old experiments conducted back several years ago is fairly typical of feeding values in which, as the result of an experiment, it shows that for every $2.50 invested in meat scrap, $23.92 is returned; for every $2.10 invested in fish scrap $22.65 was returned; and for every 30c invested in skimmilk $2.04 was returned. In the same way, I might go through and show you the difference in cost of production based on the source of animal protein feed which was used, but it is almost universally shown that the feed cost per dozen with either milk or meat scrap is about the same.

On the chick proposition there are some other problems that enter into it. For instance, the amount of the various sorts of milk given below required for three weeks for 100 chicks is as follows: Dried buttermilk, 3.906 lbs.; fresh buttermilk, 92.42; sweet skimmilk, 115.62; and sweet whole milk 117.19. The pounds of grain per pound of gain with each one of these is as follows: Dried buttermilk, 3.29; fresh buttermilk, 2.95; sweet skimmilk 2.13; and sweet whole milk, 1.91.

I believe on this basis one will find that the cost of production with whole milk is higher than it would be with the sweet skimmilk or the fresh buttermilk for two reasons: First, in that the whole milk is worth more than the sweet skimmilk, since the whole milk is quoted at about $2.50 per hundred and the skimmilk or buttermilk at about 30c per hundred. One will also find that the consumption is a little bit higher since the birds like it and will drink a greater percentage of it. A person is partly compensated in it by the smaller amount of grain required for gain as indicated in the above tabulation.

The second problem that enters into it, is the feeding of the whole milk apparently hastens maturity, which means a person is gaining on the market at the same time. If they are feeding whole milk it will allow one to put a broiler on the market about two weeks earlier than is possible with any other material. This, too, must be considered a gain because the broiler market after it is once opened is a falling market and the sooner a bird can be sold the more returns one can expect from it.

Any sort of a ration can be used with milk, in fact we don't believe that a satisfactory growth can be obtained unless milk is used in some form or other with any sort of a ration. You are, undoubtedly, familiar with the mixture which we have been recommending, and which has been given in these columns, previously known as the 80—20, composed of 80 lbs. of ground yellow corn, 20 lbs. standard wheat middlings, 5 lbs. chick size raw bone, 5 lbs. high calcium carbonate limestone, and 1 lb. of salt with milk to drink. This can be changed in those cases where dried milk is used instead of the liquid milk.

The amount of milk in this ration must be controlled as production is desired, since a liberal amount of milk continuously will, with early hatching, bring the birds into production along in the late summer, which usually results in a winter molt. We avoid this by lessening the amount of milk later on by the addition of water to drink also, or else decreasing the amount of milk given to them in order to control this growth.

When milk is used for hens it can be used exclusively and used in conjunction with any of the other animal protein feeds one needs and desires.—J. B. HAYES.

Control Costs

"Most chick mortality is due to the hatchery." That in substance is the complaint most commonly heard. It is immaterial how the chicks were handled, how they were brooded, what the conditions may have been, or how careless the feeder might have been—the hatchery was to blame for the loss.

One would think that all the hatcheries and all the breeders were trying to put out either chicks or eggs that would hatch chickens one could not raise. The opposite is nearer the truth in that any business to survive must have repeat orders. Repeat orders come only by the sale of quality. When one gets a good, thrifty bunch of chicks from a source, they are going to return there when ordering each year. Mismanagement kills more chicks than disease or poor hatching. It is a natural fact that we hate to ever admit ourselves in error. It is much easier to blame the other fellow.

There is a reasonable correlation between number of eggs produced and cost of production. A hen or a flock of hens that averages 20—25 eggs per individual in a month, is more efficient than a group that averages only 5 eggs. In the same degree is there, apparently, a ratio between the number of chicks lost and the cost of production over any given period. Some deviation exists.

Cost per chick	No.	Fuel	Feed	Cost per chick 12 wks.	Mortality
Cts.					%
15	250	$3.40	$ 28.60	$ .30	6
15	500	7.75	58.84	.33	12
13	770	8.80	136.38	.22	16
14	300	2.79	30.46	.35	29
20	837	7.77	34.40	2.74	92
Av. 14	428	4.87	47.41	.506	23

Examples cited are typical of the differences that existed. When the 92% mortality was eliminated, one found that the average cost per chick to 12 weeks was 30.3c, and the mortality was 17%. These are records taken from farm flocks that can be generally applicable.

One serious loss results from housing. Instead of following definite recommendations relative to the number of chicks that should be carried in a certain house, the effort is rather toward filling it up. Fewer chicks per lot and per house will result in better brooding results. One man recently complained of a loss when brooding 1200 chicks with one stove. Another put 600 chicks in a house 8'x8'. That isn't brooding, that is herding and results will be proportionate.

A second loss is caused by improper temperature. Most people don't attempt to keep the chicks comfortable but regulate that by the thermometer. A party put 600 chicks under two brooders in one big room which was O. K. He then closed the windows tightly, raised the room temperature, and roasted or gassed 300 of the chicks in one night. Keep heat under the brooder but keep the windows open and a lower room temperature.

A third loss is caused by dirty range. A poor range is any range that has been used by the old stock or covered with poultry manure at least two years previous. Start the chicks on clean range. Grow them on clean range and move from clean range to a clean laying house. That is the most reasonable way to prevent parasite infestation. It is superior to medicinal treatment.

A fourth loss comes from feed. This does not mean the mixture as much as the condition of the feeds. Moldy feed or litter; sour, moist mash; dirty drinking vessels; access to seepage water and things like that cause a loss in chicks. This also includes lack of fresh, succulent green feed, bare range, or improperly built rations.

When a loss in chicks occurs, one should first determine the cause. That may mean sending a chick either to a veterinarian or to the state college. This should be done when the loss starts. Most people allow about two-thirds to three-fourths of the chicks to die before trying to discover what is wrong.

If one has good equipment, good chicks, and good management, the losses will usually be low. When shoe boxes, hot bricks, feather dusters, and hot water bottles are used, one cannot expect the utmost in success.

The right equipment is a big help, but nothing has yet been discovered that is automatic. Everything, even chicks, needs attention.—J. B. HAYES.

During a 9 weeks' test at the Canada Experiment Farms chicks receiving both buttermilk and water as drink made average increases in weight of 142 per cent over those receiving no milk, and the mortality was more than twice as heavy in the latter group.

ces of Drinking Water

question of drinking water for cows is much more important me owners seem to think. We that from the ill effects we seen from letting cows have to impure water. In one in- we remember of having been to discover, if possible, the of sickness affecting a small f cows that supplied milk to a and of corresponding sickness children in the families sup- It was a bowel or enteric . The cows were "off feed" owed a rise in temperature, nordinate thirst. The feces my and foul-smelling. The af- children suffered from so- "summer complaint" which of- attributed to cutting of the ch teeth."

nvestigation showed that the as sound. It consisted of hay of good quality and a concentrate ration of ground bran, and oil meal. Grass was grazed, it being the summer of the year. Passing from the to the yard and then to the we soon found the source of . The yard was on a steep nd the leechings from it—the e tea"—ran into a depression tle" and to it went the cows ime they were let out and freely of the brown contami- ater. That water was full of osing organic matters and f a strong odor of ammonia t stand in a corked bottle for ours. A sample heated over also quickly dispelled the pink a small quantity of potassium ganate. The seep-pond was fenced off, at our suggestion, cows quickly recovered and as no further complaint from ons of the dairy. The moral it is unsafe to let cows drink tea and surface water that is t and the product of drainage gher land. Cows like such nd manure leechings. The ste is relished. Better fully he cows with salt and miner- restrict their drinking to pure

can be little question, too, mer dysentery in dairy cows iently traceable to impure water. Coccidian dysentery, g chiefly during the summer is contracted upon low, wet, land and from drinking con- d water. That, too, may be ce of scours in young calves, n such enteric troubles occur ays advisable to suspect im- of drinking water as the pos- use. The farm that has a passing through it—that is ed "mighty handy" as a wa- lace for farm animals—is not desirable on that account. am may carry noxious germs of hog cholera and germs of —and the latter disease at- l classes of animals and is mmunicable and fatal to man. nfectious diseases are trace- vater, and intestinal parasites liver fluke commonly are con- n the marshy pastures along reeks, and by lakes and pond

ws drink great quantities of is of supreme importance supply be pure and safe. e is the dairyman who can his cows with such water from individual drinking cups of a gravitation water supply so that they can "help themselves" to it at all times and run no risk.

Ringworm

I am having trouble with calves from four to eight weeks old getting a scab or what has been called vegetable growth, first appearing around the eyes, then spreading to other parts of the body in spots. Is this growth contagious? How can I prevent it and what is a cure for it?

Wrenshall, Minn. W. R. C.

The disease described is ringworm, also called "barn itch." It is contagious, being caused by the vegetable parasite *trycophiton tonsurans* which grows upon damp walls and woodwork as well as upon the skin. Isolate affected calves and cleanse, disinfect, whitewash, and properly light and ventilate the stable. It would even be better to supply new, sanitary quarters for unaffected and perfectly recovered calves. Treat spots about the eyes by bathing several times daily with a solution of hypochlorite of soda ("B-K"). Treat other spots by saturating with oil until the crusts or scabs can be removed without drawing blood. When that has been done apply strong iodine ointment on and around each spot. Do that twice daily for 2 or 3 days and then as often as is seen to be necessary. Another and cheaper treatment, where many animals are affected, is to saturate the spots on the body, at intervals of 6 or 7 days, with a solution of 4 ounces of bluestone per pint of hot water.

Hard Milker

We have a cow here seven years old that always was a hard milker but she seems to be getting worse. It seems her milk wells are closing up but there is no obstruction that can be felt.

Is there much danger from bloat with sweet clover? How would it be for a night pasture? We can't use alfalfa for pasture here at all for cattle.

Waverly, Minn. T. D.

Insertion of sterilized dilators or teat plugs should be tried. If such dilation of the teat ducts, caused in that way, does not succeed the only recourse will be to have a veterinarian slit down through the stricture in the milk duct by means of a sterilized teat bistoury. The cut is made in 2 or more different directions. Afterward apply twice daily a little yellow oxide of mercury ointment (ophthalmic) during the healing process. If you do not care to have that done, let a calf nurse.

Bloating is liable to occur when cattle suddenly are allowed to graze any rank, wet growth of a legume roughage. Sweet clover, however, seems less liable to cause bloating than red clover or alfalfa. Feed cows hay before pasturing and keep them off the green crop when wet with dew or rain. Allow free access to salt and slaked lime.

Obstructed Teat

I have a cow that freshens this spring and the milk won't hardly come down from one of her hind teats. I have to catch way up in her sack to get the milk out and then it comes down very slowly. What is the trouble and is there any remedy for it?

Nashville, Wis. E. M. B.

There is an obstruction high up in the teat duct and an operation in such a condition is liable to result in destructive infection. It would be best to let a calf nurse or to dry off the secretion of milk in the affected quarter.

Wart

I would like to have a little information about a large wart on my heifer's neck. It is the size of a large hen's egg and is on the top of her neck. There are four small ones starting out around these. I have been greasing it well with castor oil but it seems to do no good and gets larger.

Linn, Kans. V. C.

If the wart has a slim neck it may at once be twisted off or pulled off. If you cannot manage that tie a fine cord tightly around the base of the growth, in a bow knot, and tighten the cord daily until the wart drops off. Then apply pine tar or tincture of iodine. Keep the smaller warts covered with a thick paste of cold pressed castor oil, salt, and flowers of sulphur and they should soon disappear.

Goiter

Kindly tell me of a remedy to cure goiter on young calves.

High Bridge, Wis. F. A.

To prevent goiter in the new-born calf give the pregnant cows two grains of potassium iodide daily in her drinking water and feed a complete ration. Treat goiter in a new born calf by painting the enlargement with tincture of iodine 2 or 3 times a week and giving the calf 2 grains of potassium iodide daily in water. Study bulletins on minerals for live stock which you can obtain from the state experiment station at Madison.

Infected Teats

I have four cows in my string that I have trouble milking out of one quarter. End of teat seems to close very tightly with some swelling in teat and up in quarter. This trouble started about 4 or 5 days ago and two of them it is impossible to milk without milk tubes now.

Priest River, Ida. L. L. H.

Germ-invasion from contaminated floors or ground causes sores at the tips of the teats and thickening of the lining membrane of the duct, as the infection spreads upward. Use of a milking tube tends to spread the infection and eventually causes ruinous mastitis (garget). When a case is starting immerse the teat for 5 minutes or more, night and morning, and then swab with a 2% solution of mercurochrome, or apply a mixture of 1 part or tincture of iodine and 2 parts of vaseline. Also insert a piece of thick carbolized cat-gut or a medicated teat plug in the duct of the teat, between milkings. Where the duct has nearly closed it will be necessary to have your veterinarian operate with a teat bistoury. Isolate affected cows. Cleanse, disinfect, and whitewash the stable, including the floors and gutters.

Death of Cow

All cows in this vicinity are being tested for T. B. as milk is shipped to the cities. One of my neighbors had one that calved a couple of hours after injection of tuberculin and about 12 hours afterward she died. Owner thinks that the injection of tuberculin caused death. Will you kindly inform me if you think this is probable and if it is considered safe to test cows about to freshen or immediately after.

Poplar, Wis. P. A. P.

It may be taken as certain that the injection of tuberculin was in no way responsible for the death of the cow in question. It is harmless to a cow that is not affected with tuberculosis. The intradermic or "tail" test may be applied at any time, but it is not advisable to apply the thermal or subcutaneous just before or just after calving. We suspect that the cow died of milk fever or a hemorrhage.

Heaves, Coughs, Conditioner, Worms. Most for cost. Two cans satisfactory for Heaves or money back. $1.25 per can. Dealers or by mail.
The Newton Remedy Co.
Toledo, Ohio.

COW-EASE

Better Milk··· and more of it!

Comfortable cows give more milk. That is why thousands of farmers increase production by using Cow-Ease. Used twice a day, at milking time, it keeps flies off. Applied with a sprayer, it won't injure the cow's skin. Repellent to cattle ticks, grubs, lice and mites. Use on horses or in hen houses.

Get the can with the blue Cow-Ease label. One gallon sprays 200 cows. If your dealer does not have it, send his name and address and $1.50 ($1.75 west of Missouri River) to Carpenter-Morton Co., Boston, Mass., and we will deliver one gallon prepaid. Sprayer 60c extra.

Satisfaction guaranteed.

for feeding calves

Do you know that you can cut milk costs in half by adopting the "minimum milk method," using dry skim milk? Hundreds of dairymen who sell all their whole milk are making this big saving. They simply mix a pound of dry skim milk with a gallon of water, making a money-saving mixture which young calves thrive on. And they buy a pound of dry skim milk for half or less of what they receive for a gallon of whole milk. (1 gallon whole milk contains 1 pound milk solids.)

AMERICAN DRY MILK INSTITUTE
160 North La Salle Street Room 720-C
CHICAGO, ILLINOIS

FREE Write today for "Better Calves" giving successful feeding methods. State number of calves you feed. We'll tell you where to buy dry skim milk.

Remixed—1 pound dry skim milk to 1 gallon of water —is also good for pigs and poultry. It is splendid also for baking.

Dairying in the Western Counties of North Carolina

(Continued from page 725)

cash income. Pastures would also help bring the land under cultivation. Four clubs were organized and three pure-bred registered Jersey bulls purchased. One pure-bred bull was already in the county so that a bull circle of four blocks was organized and 25 grade milk cows were brought into the county.

The plan was to obtain one co-operator in each community who would agree to run a demonstration dairy under the direction of the county agent who would give him all the assistance he could and also get help from the state specialists when necessary. Thirteen cream shipping demonstrators were secured, one or more in each township, and the first can of cream was shipped from Clay County early in March. During the following 8 months, 3,072 pounds of butterfat were shipped by these demonstrators, netting them $1,075.20. Five cream separators were placed and on August 1, a cream buying station was established for cream shippers' convenience.

The first silo was put up in August, 1924, by one of the dairy demonstrators. It was a 50-ton wooden silo, costing $125, on the farm of B. and Ed. Kitchen, Shooting Creek township. In the fall, the first county dairy show was held with fifty head of dairy cattle shown.

In 1925, there were 30 demonstrators co-operating and 27 finished with accurate records kept. The dairymen of Clay County received $3,000 in cash last year and dairying is the principal agricultural interest in the county and the best source of cash income. The cream is shipped to Asheville and the cows are all tuberculin tested in the demonstration herds. Willard R. Anderson is the county agent.

324 West 23d St., NEW YORK, N. Y.

Jersey Bull Calves
We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. outterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.
THE GOLDEN GLOW JERSEY FARM KENSINGTON, MD.

Lime and Phosphate in Kentucky

On soils outside the bluegrass region in Kentucky, the application of ground limestone has given profitable crop increases. When lime and phosphate are both used, a greater profit is obtained than where either is used separately. The average crop increases from this treatment have been: Corn, 14.6 bushels; wheat, 7.6 bushels; soy bean hay, 1,337 lbs.; clover hay, 2,021 lbs. All crops considered, the yields have been practically doubled. The ground limestone was used at the rate of 2 tons per acre for a 4-year rotation period. The acid phosphate was used at the rate of 800 lbs. per acre for each 4-year rotation or 200 lbs. per acre per year.

Write for our booklet—
"The Holstein-Friesian Cow"

HOLSTEINS
are producers of
BUTTERFAT

Holsteins lead the world in production of butterfat—the largest factor in dairy profit. Eighty per cent of the cows which have produced 1,000 lbs. or more of butterfat in a year are Holsteins.

Fred C. Nichols, Farmer, makes a discover

"I decided to try your Mobiloil," writes Fred C. Nichols of Delanson, New York, R.D. 2. "Right here I will say I wish I had decided before, and I would not have had to put in new rings and pistons this spring.

"To say that I am pleased with Mobiloil is putting it mild. Such a change in my motor—I haven't had a plug out since I started using it. She runs so much smoother and so much more power.

"I live on a dirt road, long hard pull and then a very steep hill to get up on the farm, and on this hill I had a chance to notice my extra power—the motor starts as easy again. When you say it is worth a special trip to town you are right, it is, and I would rather make the trip than put any other oil in my crankcase.

"I use a Stewart truck also a Ford motor and draw heavy loads, and think Mobiloil the best oil on earth.

"Just why I am writing this letter I don't know—probably it's because I am so pleased with Mobiloil. I will use it on all my farm machinery next summer. Best wishes to you and Mobiloil."

Similar experiences await you!

Actual use of Mobiloil has opened the eyes of countless farmers to real engine economy and efficiency. Mobiloil costs a few cents more per gallon than ordinary oils. But, despite this fact, *it is the most asked-for oil among farmers today.*

"Extra" power is what you want. It is what you get with the correct grade of Mobiloil in your crankcase. Think what that means in the operation of your tractor!

The continued use of Mobiloil will introduce you to a series of savings that far outbalance the slight extra price. Less wear. Fewer repairs and replacements. Greater freedom from carbon and overheating.

Mobiloil frequently lasts twice as long as ordinary oils in a tractor. And many farmers report that Mobiloil cuts oil consumption in cars and trucks from 10% to 50%.

YOUR guide—if your car is not listed below see any Mobiloil dealer for the complete Chart. It recommends the correct grades for all cars, trucks and tractors. And remember that . .

609

automotive manufacturers approve it!

The grades of Gargoyle Mobiloil, indicated below, are Mobiloil "E," Mobiloil Arctic ("Arc."), Mobiloil "A," Mobiloil "BB," and Mobiloil "B."

GARGOYLE

Mobiloil

Make the chart your guide

HOW TO BUY— A nearby Mobiloil dealer will gladly offer you a substantial reduction on quantity orders—barrels and half-barrels. This method of buying Mobiloil recommends itself for two reasons, (1) the cash savings, and (2) the convenience of having a long-time supply on hand. Ask your Mobiloil dealer which grades of Mobiloil to use in your car, truck and tractor. He has the Mobiloil Chart which has been approved by 609 makers of automobiles and automotive equipment.

don't fool yourself

Loses job and sweetheart

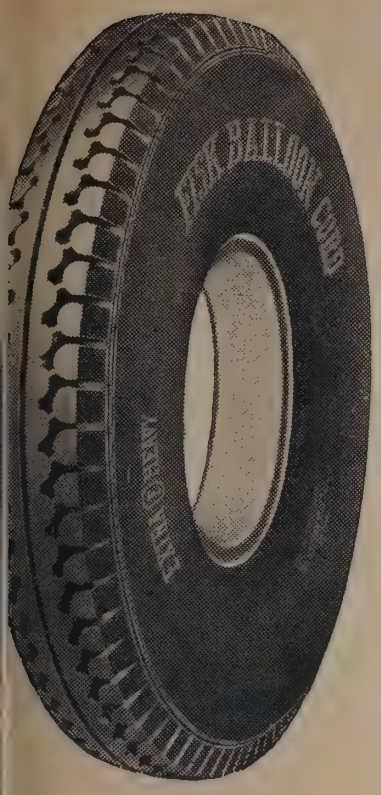
Your common sense tells you that neither employer nor sweetheart can stand a case of halitosis (unpleasant breath) very long.

You, yourself, can never tell when you have halitosis. But you'll *never* have it, if every day you use Listerine, the safe antiseptic.

Listerine immediately destroys odors of all kinds and so leaves the breath normal and sweet. And the antiseptic essential oils combat the action of bacteria in the mouth.

Begin using it now. Common decency demands it. Keep a bottle handy in home and office. It puts you on the popular and polite side.

Lambert Pharmacal Company, St. Louis, Mo., U. S. A.



1/3
Had Halitosis

80 streetcar conductors, meeting the public at close range every day of the year, said that about one person out of three offends by halitosis. Who should know better than they?
Face to face evidence

LISTERINE

Milk Stool Philosophy

HOARD'S DAIRYMAN:—People who really think they are honest in their conclusions are not necessarily right. Sincerity cannot make up for an unsound reasoning and conviction. No reasoning is sound and really four-square unless it is the result of a most careful study of cause and effect. Very few of us trouble ourselves to really get the cause. We simply take an early effect and call it the cause, and then honestly follow its effects until we come to a conclusion which we like. Then some one else takes another effect of the same cause and honestly follows it and comes to a conclusion which we don't like in the least. This does not occur because either of us were dishonest in our reasoning, but because both of us got the wrong start.

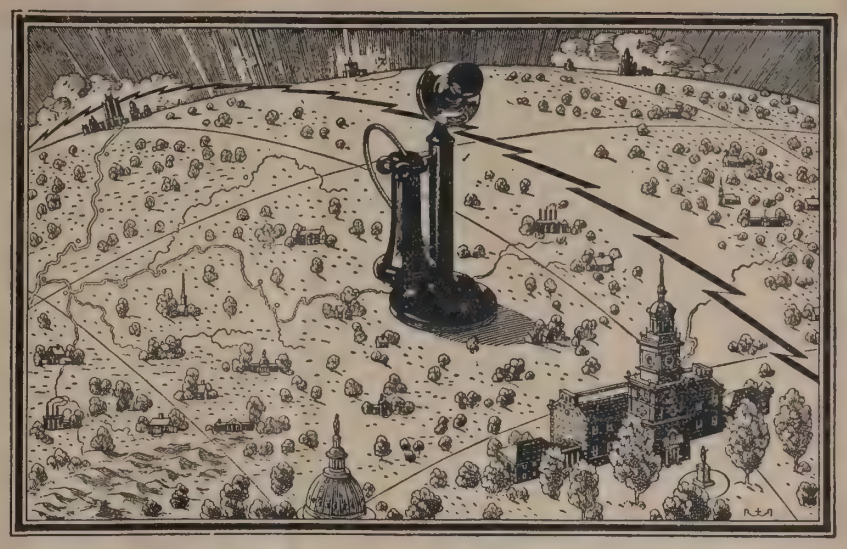
Our basic pursuit in life is happiness. We plan, we work, we save, we invest, and we willingly undergo severe self-denials because in the end we hope for happiness. Even hope, which plays so large a part in our lives, gives birth to a great joy other than the one we seek but which it could not have been if we had not pursued. There should, therefore, be no check on any one's pursuit of happiness, but there could well be a check on the means some use in its pursuit. Selfishness, greed, indulgence, and lust have been used until the very pursuit has gotten in disrepute.

Humans seek happiness in one of two ways, either on the premise that the world owes us a living or on the premise that we owe the world a life. It is only the ones working from the first premise who need a check; the others need encouragement.

Minnesota. J. J. SPRENGER.

Cutting Down the Feed Bill

HOARD'S DAIRYMAN:—There is but one way to figure the dairy cow business to prove whether you are keeping your cows or they are keeping you—that is, to apply the foot rule to the difference between feed cost and cream checks, as Clair F. Limbeck, a successful Northeastern Iowa dairy farmer views the matter.



The Limbeck Holsteins rank among the best producing herds in Iowa cow testing associations, but that isn't the big thing, as the situation is considered at the Limbeck farm. The chief interest there is the way, the past two years, the difference between feed cost and money earned by the cows has been widened by feeding alfalfa hay in winter and pasturing the cows on sweet clover in summer.

The widening has been effected at both ends. Production has increased materially, and feed cost has decreased in the same way. Alfalfa and sweet clover are given credit for both increase and decrease. "It is cheaper to grow proteins than to buy them, we have found, and the cows do better on them," said Mr. Limbeck. "We used to buy proteins extensively. Now our bill for them is much less and our cows are producing better."

The Limbeck farm has twenty-five acres of its 110 acres in alfalfa and nine acres in sweet clover. A fine stand of both crops was obtained by liming, inoculation, and the use of good seed. The nine acres pastured thirty-five head of cows and young stock from May until the last of September in 1926. Then, feeding alfalfa started.

Iowa. F. L. CLARK.

The secret of life is not to do what one likes, but to like to do what one has to do.—HALE.

The Traveler's Telephone

An Advertisement of the American Telephone and Telegraph Company

AMERICANS are the greatest travelers in the world. They have knit the country together by steel rails and made it the largest and most prosperous business community the world has ever seen. Business, friendship and political solidarity are maintained by personal touch, by travel and the telephone.

Wherever the business man goes in this country, be it thirty miles or three thousand, he is still within earshot of his office, his family and his friends.

He can get them and they can get him, and for the longest call in the United States the day rate is only $12 and the night rate is only $6.

For the Bell Telephone System is an idea in force nationally. All the instruments are designed in the largest industrial laboratory in the world and made in the same factories to the one standard of fitness. All of the telephone builders, repairers and operators are trained to the same ideal and aim; stated by President Walter S. Gifford as:

"A telephone service for the nation, so far as humanly possible free from imperfections, errors or delays, and enabling at all times anyone anywhere to pick up a telephone and talk to anyone else anywhere else, clearly, quickly and at a reasonable cost."

The famous purebred Jerseys owned by Mr. George W. Sisson of Potsdam, N. Y., are regularly milked with the De Laval Milker. Some remarkable records have been made by individuals of this herd, foremost of which is their famous matron, Bess Irene 351690. All cows on test are milked with the De Laval and Mr. Sisson speaks very highly of its work. The cow with the milker attached, shown above, is Bess Irene.

Many of the Finest Cows of All Breeds are Milked with the De Laval Milker—

for Better Milking and More and Cleaner Milk

THE list of herds milked with the De Laval Milker contains the names of many of the world's most noted cows. The De Laval is used on herds of this kind to assure maximum production, cleaner milk and better milking for the cows.

Many well-known records have been made by cows that were milked with De Lavals exclusively during their entire test periods. Hundreds of owners of good cows have installed De Laval Milkers so that they might be sure their cows were receiving the best milking possible, thereby avoiding injury to teats and udders.

That the De Laval Milker produces much cleaner milk is unquestionably proven by the number of Certified, Grade A and Special Nursery milk producers who use and endorse it.

De Laval engineering ability is always at your service. Write the office listed below which is nearest you for complete, detailed information. or see your local agent.

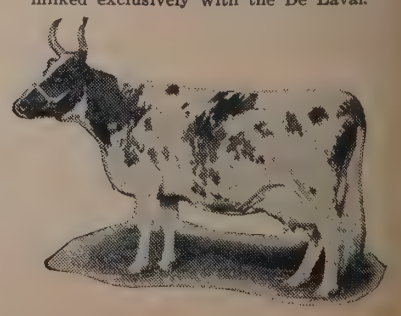
No one familiar with the Guernsey breed will dispute the statement that the purebred herd kept at "Munroholm," Mr. Thomas H. Munro's splendid Guernsey farm at Camillus, N. Y., is one of the very finest. It was here that Edytha of Munroholm 144838 A. R. and Monie of Monroholm 149795 made their famous records. Both were De Laval milked while on test. The manager states that he does not know what he would do if forced back to hand milking.



De Laval Milker

Mayowood Farm at Rochester, Minn., has two equally strong claims to fame. One is the fact that it is owned and operated by the Mayo Brothers, who are among the world's most noted surgeons. The second claim to fame can well be made through the purebred Holstein herd which is kept there. Some of these high producers have made excellent records and all have been benefited greatly through the continued use of the De Laval Milker. The management recommends it highly.

Mr. Robert L. Knight's beautiful "Lippitt Farm" is the home of an outstanding purebred Ayrshire herd. This herd has been milked with the De Laval Milker for some time and Mr. Knight goes on record as being well pleased in every respect. The beautiful individual shown below is Oldhall Sarah 2nd who, at the age of *14 years*, produced 10 626 lbs. of milk and 370.79 lbs. of butterfat on 360-day test. During this period she was milked exclusively with the De Laval.

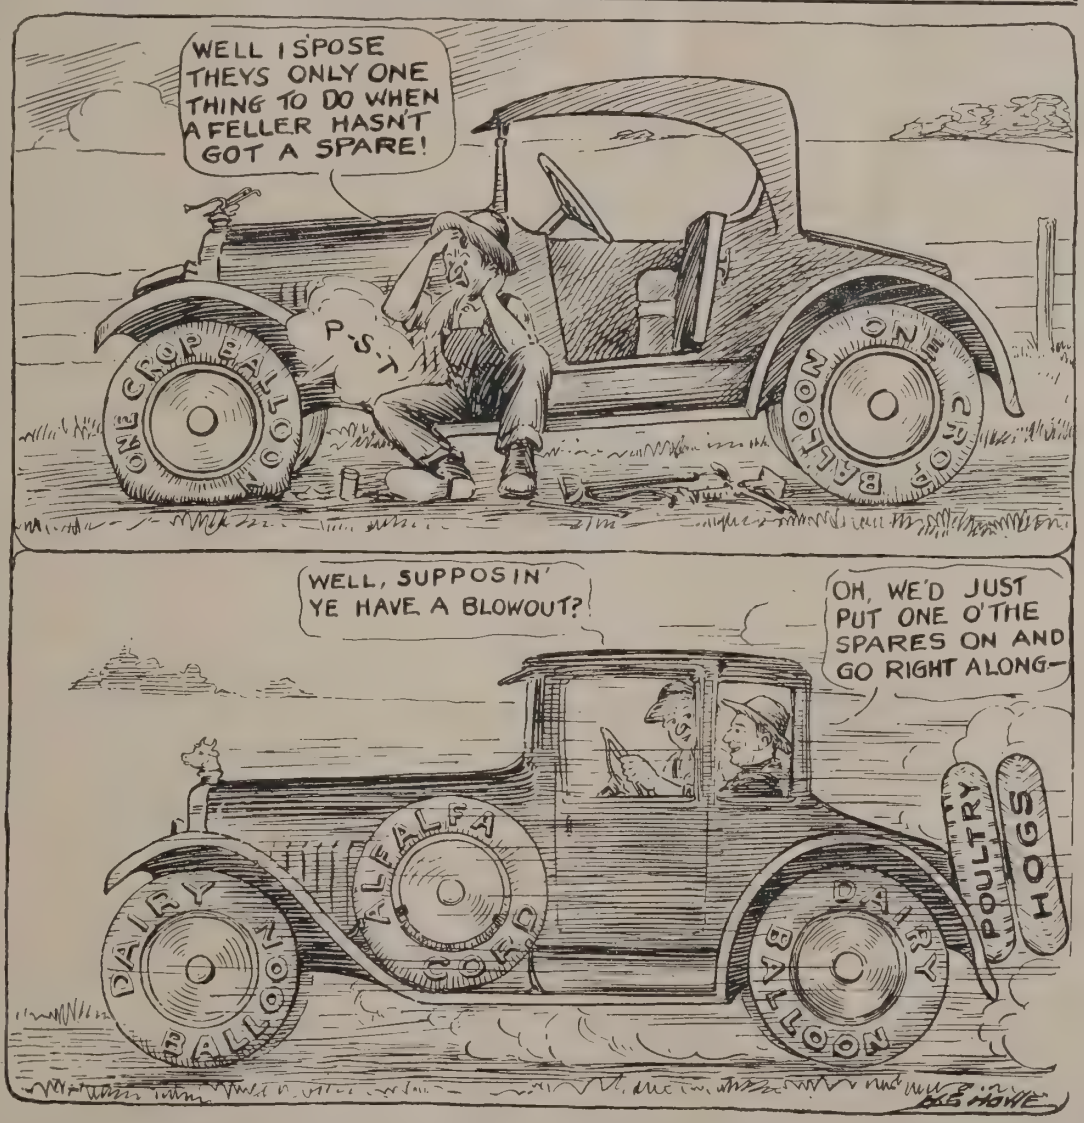
side, rushing madly after my horde of rapidly retreating and falling Indians. I was in my glory.

When the cows filled up and began to roam, I drove them back into the old pasture and went back to my hoe. In the days that followed I learned to endure my colorless hours with a hoe by looking forward to the fun of watching cows. And in looking forward to this job I took more interest in my hoe. It was here I learned my first secret in the philosophy of life. It was this: The quality which holds us to the monotonous duties of our work and makes the most heartless tasks bearable is ANTICIPATION.

Later I graduated from my hoe to the barns. Here I was to clean stables and curry stock, and I confess I was thoroughly sick of being personal valet to about forty head of cows and eight or ten horses. I became completely disgusted with this work before the first week had passed, but kept doggedly at it, cleaning stalls and gutters, grooming horses and cows, and sweeping floors and alleyways.

Finally, one day, the boss took me with him to buy stock. We visited a number of barns and saw a large number of animals. As I went through our neighbors' barns and looked over their herds, I had an opportunity to make comparisons. Some places were very neat and attractive; others were filthy. Some stock was well fed and cared for; many were in very poor condition. When I returned to our farm and got back to my work, my job took on a different aspect. It did not consist so much of hauling refuse out of stalls and gutters as it did in seeing what a neat barn I could keep and how sleek I could keep my charges. And right here I discovered another secret. The degree of "humdrumness" in our duties depends very largely on our POINT OF VIEW.



Then, after finishing high school, I came home to work in earnest. I took charge of our retail milk route. I shall never forget the first trip over it. We drove nine miles to town with a team, changed horses, and peddled milk to two hundred private houses. I thought we should never finish this trip. The entire procedure was a blur. When we finished our delivery we ate dinner, again changed to our original horses, and drove the nine miles home. For a week this program was repeated. At the end of that time, the boss decided that I could run the route alone.

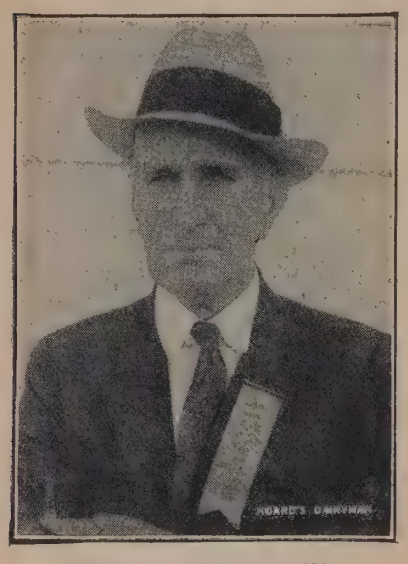
For some time the long drive to town, the drudgery of two hundred stops, and the return home was terribly monotonous. But as I became accustomed to the road and as I became personally acquainted with my customers, the monotony disappeared and I started to take an interest in my work. Soon I prided myself on being on time, on giving each individual personal attention, while at the same time I took an active interest in the appearance of my horses and wagon. At this point another and perhaps the most important of life's secrets revealed itself to me. Everyday duties are humdrum only until one awakens to the service rendered by their painstaking performance.

Now, as I stop to ponder on why man has given up his liberty and sacrificed so many of his instinctive desires at the altar of civilization, I believe that his personal sacrifices have been freely offered. And they have been given not purely from an expectancy of personal gain, but from the nobler realization that in the giving he has been able to perform his greatest degree of service to his fellow man.

So when your job looks blackest, step back and look at it as an outsider. Realize that upon its satisfactory performance depends not only your present material welfare, but that in its well doing the public as a whole and you personally benefit to the same degree.

VALUE OF PREPAREDNESS

Cream cheese made by adding to a rich cream the desired proportion of skimmilk solids in the form of dry skimmilk shortens by many hours the process of manufacture. The new cheese is smooth and buttery and has a richer taste.



"Let us develop the resources of our land; call forth its powers, promote all its great interests, to see whether we also, in our day and generation, may not perform something to be remembered."—WEBSTER.

Hind—Clark Dairy in Hawaii

W. H. PHILLIPS, HAWAII

IT has occurred to me that the readers of Hoard's Dairyman may be interested in knowing about a model dairy out here in the middle of the Pacific Ocean.

Fifteen minutes' ride from Honolulu on a fine macadamized road

SENATOR ROBERT HIND

takes you to the Hind—Clark dairy which has the Pacific Ocean in front and the Koolau range of mountains behind; on the right, a grove of algeroba trees; and on the left, a field of alfalfa from which are cut ten or eleven crops a year; beyond this, a field of sorghum standing eighteen feet high, which will probably yield twenty to twenty-five tons to the acre.

There are three hundred cows in the dairy—two hundred being milked at the present time. Of the two hundred, about one hundred and fifty are Guernseys and the rest Holsteins. The cattle are kept in the grove of algeroba trees where they are fed green alfalfa in racks with a ration of dry hay once a week. The cows are kept out of doors all of the time except when being washed and milked.

At milking time they pass into a paved yard from which a run-way containing running water leads into the part of the barn where they are washed while receiving their ration of ensilage and dry feed. Thirty cows at a time are stanchioned here. After they come in with their feet well soaked by the water through which they have passed, attendants with brushes are ready to remove every particle of dirt from their bodies, except from the udders which are washed and dried later in the milking stable. The cows pass from this room into a vestibule from which they are admitted to the milking stable in relays of twelve at a time.

After carefully washing and drying the udders, they are milked with a milking machine and then pass out through doors in front and back to the corral. The two hundred cows are washed and milked in about three and one-half hours.

The milking is done with closed pails from which the milk is elevated and passes through pipes directly into the bottling room. Then it passes over a cooler, which in two minutes lowers the temperature to 38 degrees F. This is the only time it comes in contact with the air. It then passes into a tank and is ready for the bottles.

The milk is all certified, the Guernsey milk selling for thirty cents a quart and the Holstein for 22½ cents.

The surplus milk is skimmed and made into cottage cheese which retails at forty cents a pound.

Recently the Hind—Clark dairy furnished a naval transport carrying 1,400 people with sufficient milk and cream to last until they reach Japan, a journey of ten or eleven days.

The crops are all raised on irrigated land. Any surplus of alfalfa is put into hay and held in reserve. Sorghum is made into ensilage. Five or six crops of sorghum are harvested before it is necessary to replant.

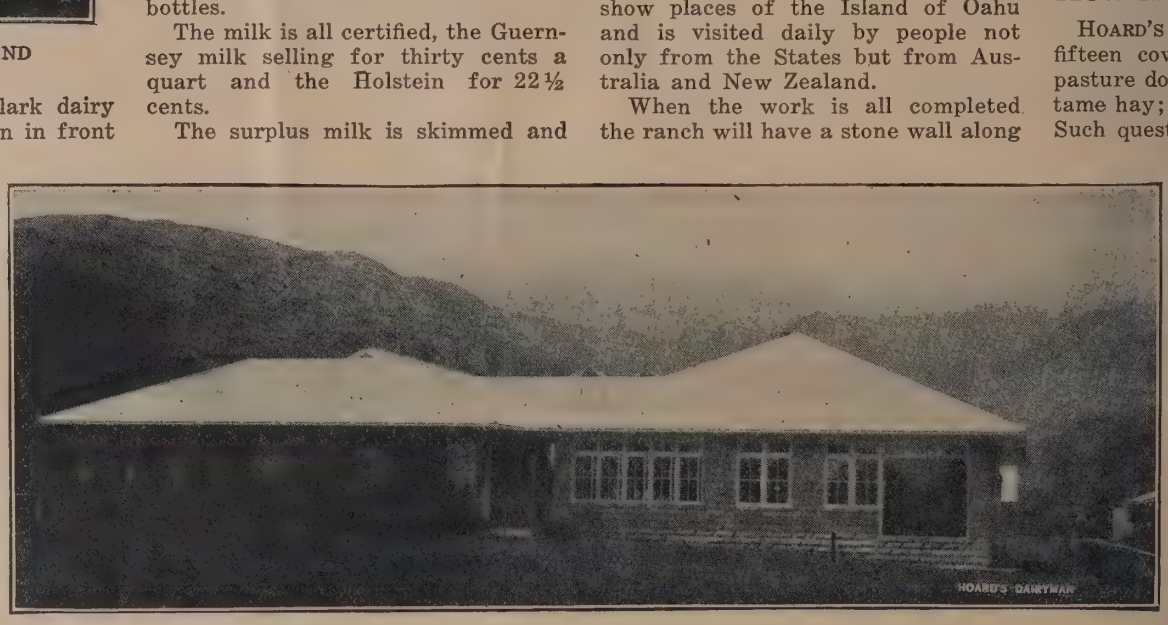
The dairy has its own ice plant. The milk is sent into the city on Dodge delivery cars.

The whole plant represents an investment of about $500,000. Last year the pay-roll, including work done in clearing land and other beginning work, approached $60,000. While the plant is not yet a year old, it is a commendable example of constructive work on the part of the owners.

These men did what other dairymen would do well to notice. They went to the head of the Queen's Hospital, Dr. Larsen, who had been active in a movement to secure pure milk, and asked for advice as to just what should be done to insure the production of sanitary milk. Dr. Larsen, who had been active in a movement to secure pure milk for the city of Honolulu, was well qualified to give such advice.

Also Senator Hind visited personally many good dairies in the States and put into practice the knowledge thereby obtained.

As a result, this dairy is not surpassed by any I have seen in the States and few, if any, can equal it. It is rapidly becoming one of the show places of the Island of Oahu and is visited daily by people not only from the States but from Australia and New Zealand.



When the work is all completed the ranch will have a stone wall along the three-quarters of a mile on the road and the wall will be covered with the Huapala vine, whose y blossoms will typify the g Guernsey milk produced here.

The ranch, with its backgrou purple mountains over which clouds hang in ever changing c with its many fields of alfalfa sorghum and beautiful alg trees, already presents a sight v coming far to see.

We invite you and your reade come and see it.

Elmer Buddenhagen keeps accounts and runs his farm on a business basis. Here he is feeding the pigs.

LIFE AND WORK OF T. L. HAECKER

No. 3

PROFESSOR Haecker was 45 years old when he joined the staff of the Minnesota College of Agriculture in 1891, beginning his memorable and remarkable career as a dairy investigator. Lincoln was still in his twenties when he began his political career. Many of our great leaders have launched their life work early. While Haecker began somewhat late in life on the work which was to bring him fame and to greatly stimulate the dairy industry, his whole previous training had really been pointed toward some such goal and helped materially in developing his investigational abilities as they were to be applied to the dairy industry.

Haecker's political affiliations as secretary to the governor continued over a period of 17 years, but in 1891 at the conclusion of Governor Hoard's term, this connection was abruptly cut off by the changing administration. He went directly to the dairy school at the University of Wisconsin, then just being organized, and enrolled in its first session. His buttermaking ability was soon recognized by the instructors and he was enlisted as a teacher. In the spring, a call came from the Minnesota College of Agriculture for a dairy specialist, and he accepted. He was given instructions to select and purchase a carload of cows for the Minnesota College herd. He did this, purchasing mostly Guernseys and Jerseys and rode with the cows to the college. Complete records were kept by Professor Haecker on all the cows in the college herd for 27 years from the time that the first carload of cows was unloaded.

The first dairy school in the world. In this building T. L. Haecker was a student and teacher with Dr. S. M. Babcock, H. B. Gurler, and W. A. Henry when the school was organized in 1891, at Madison, Wis. In the oval is a picture of Professor Haecker, at 45 years of age, when he entered the dairy school.

Publishes First Bulletin

Haecker's first bulletin describing his investigational work at Minnesota was published in October, 1894, and contained reports on the following subjects: Dairy Herd Record for 1893, Cost of Butter Production in Winter, Comparing Prairie Hay with Timothy, Rearing Dairy Calves, Cooperative Creameries, Experiments in Sweet Curd Cheese Work.

Professor Haecker appreciated that the problems of dairying were numerous, but he had the necessary foresight and judgment which enabled him to select those lines of investigation which were of greatest practical benefit and of the most pressing need.

He had a very definite purpose in keeping a complete dairy herd record for 1893. In his bulletin he wrote: "One of the most important factors in dairying is the cost of butter production and to ascertain this the annual yield of milk and butterfat of each cow in the University Farm herd and cost of feed for each was the chief object of this record."

That his records were accurate is shown by this statement, "It was the aim not to resort to any estimates in this work when it was possible to get actual results. Each milking was therefore weighed and recorded and a sample taken and tested by the Babcock test for per cent of fat."

Haecker was one of the first to study the relation between form and function in the dairy cow. He divided the cows into groups according to their general conformation, studied their records, and found that production was influenced by form.

Some of his observations and conclusions from 1895—1900 on the relation of form to function in the dairy cow were embraced in these statements:

"The productive capacity of a cow depends more upon type or conformation than upon size or breed. Those of the beef type produced butterfat at a feed cost of 17½ cents per pound; those carrying a medium amount of flesh produced butterfat at a cost of 15.1 cents per pound, and the spare cows having deep bodies produced butterfat at a cost of 12.1 cents per pound.

"During the five years of careful investigation in regard to the cost of production of butter between cows spare and angular in form and cows carrying considerable superfluous tissue and having an inherited or acquired disposition to convert feed into flesh, the records show that in every instance the cow that carried the least flesh charged the least for butter, and just insomuch as one cow was a little smoother and plumper than the other would, the butter product cost more than that of the other.

Spare Cow Beats Fleshy Co

"It should be borne in mind that the results are not made from ages where sometimes the fleshy produced butter at less cost but often at greater cost than the cow but are from accumulated mony showing not only that day, every week, every month during her entire lifetime, the cow is the better. That she shou so much better is almost incre strong and uniform as the evide

"The cows included in the groups ranked, with reference t amount of tissue they carried ar feed cost of producing a pou butter, as follows:

Ethel, grade Shorthorn
Ligetta, grade Shorthorn
Fairy, grade Shorthorn
Ida, grade Shorthorn
Lydia, Brown Swiss
Topsy, grade Holstein
Sweet Briar, Guernsey
Duchess, Jersey
Fortune, Jersey
Houston, Jersey-Guernsey

"The vital question that con every dairyman in the land is, shall the line between these co drawn? And before he makes th cision it will be well for him to t few things into consideration; the first and most important the ruling price of dairy pro Ten years ago, when the av price of butter was 26¼ cent pound, all of the cows would do itable service in a dairy. But prices are such that a net retu 15 cents per pound is the av that can be expected, he must closely the cost of production, margin between cost and return be so close that he will be forc the conclusion that 'dairying d pay.' *It follows then, that so f profits in the dairy are concerne more closely he restricts his he cows having the typical dairy the more certain and greate profits.*

"The second point to be consi is the length of time the dif types of cows will do service i dairy. Our records indicate tha cows having a flesh-growing her under liberal feeding, remain i dairy only a few years, whil spare cows do good ice to a ripe old ag

Advocates Single pose Cow

In 1894, though preliminary records available, Profe Haecker saw that s gle purpose dairy was the profit mak

THE DAIRY BARN AT THE MINNESOTA SCHOOL OF AGRICULTURE WHERE HAECKER CONDUCTED MANY OF HIS EARLY EXPERIMENTS IN FEEDING COWS. ETHEL, RIGHT, BEEF TYPE, AND HOUSTON, DAIRY TYPE, TWO COWS WHICH HAECKER USED IN HIS SINGLE VS. DUAL-PURPOSE EXPERIMENTS

dairy farmer. He observed that vs varied in their annual produc-n, but his convictions remained un-erved. "It will be found as the rec-s of this work accumulate that va-tions in yield of individual cows l occur from year to year just as is case in field crops; and so it may pen that in comparing the per-mances of cows of different types l breeds that now and then a good 's poor year will be compared h a poor cow's good year to the ap-ent disadvantage of the former; the adaptability of a certain style ow for dairy work has been as y and clearly demonstrated in ctical dairy husbandry as in ex-imental work."

s a graphic illustration of the re-on of form to function, he cited records of Ethel, of beef type, Houston, of dairy type. "The y one that fairly represents the rage cow on our western farms is el, though her yield of butter is h greater than statistics give as average yield of the cows in the st. Ethel was of the blocky type; hook points were well rounded; lders broad; cylindrical body; , loin, and back well padded with ; chest deep and flanks low, giv-her a level top and bottom line; hs full and when fresh she car-a fine udder and gave a good s of milk. She was greatly ad-ed by farmers visiting the station was frequently pointed out as the l farmer's cow.

Houston was of the extreme angu-type; her hook points were sharp; lders narrow; body flat or what ften termed slabsided; her ribs, , and back were free from flesh; t narrow and lacking in depth; ks cut up; body long; bottom line ave, giving her a 'pot bellied' ap-ance; thighs spare and rear line rving; very short from hook ts to pin bones; prominent rump spinal column; light neck; top dropping down from the withers; head rather heavy."

ouston, dairy type, produced but-at a cost of 3.5 to 4.9 cents a d during the winter while Ethel's luction cost was from 4 to 12.8 s a pound. There was little dif-nce in the weekly butter yield n the two cows were fresh. Hous-gave the largest yield for any one , 13.65 lbs. The week before be-turned out to pasture Houston 12.62 lbs. while Ethel only gave lbs. of butter following a steady ine in production.

Dairy Bred Cows Win

gain Haecker brought out that and production are closely asso-d when he wrote, "The impor-e of having stock intended for the y produced by dairy sires is forci-illustrated, where it is shown by al experiment with twenty-three , on a year's trial, that the dairy cows produced on an average 337 ds of butterfat at a feed cost of cents per pound, while the cows ng a tendency to convert feed in-eef on practically the same ration , on an average, only 267 pounds utterfat, costing 13.8 cents per d. There are, now and then, good y animals produced by sires be-ing to beef or general-purpose ds, but they are exceptional cases. great majority of the offspring be a failure in the dairy."

Studying Co-operation

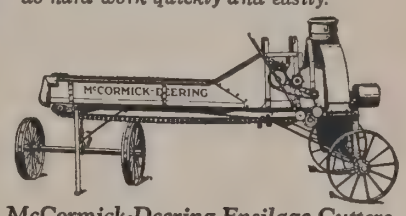
e have already referred to ker's pioneer efforts in the field o-operative creameries. Soon af-coming to Minnesota, Professor ker was called upon to make a ey of creamery conditions in the Gopher State. His travels took him to all parts of the state. It was often necessary for him to walk from one creamery to another and he sometimes walked as far as 8 or 9 miles between creameries. Conditions were rather discouraging until he reached the Clark's Grove Creamery near Albert Lea, where he found the first co-operative creamery in the state. He investigated the organization and plans of the creamery. And then he went about the state preaching the gospel of co-operative creameries from "nail kegs and soap boxes" wherever he could find an audience.

From this experience he wrote in his report on co-operative creameries: "After a thorough canvass of the state it was found that about half of the vacant factories are in localities where there are not a sufficient number of cows; others failed because they were owned by individuals who did not pay enough for cream to make it an object for the farmers to patronize them. As a rule, the gathered cream plan, where old methods of setting milk were used, did not give satisfactory returns to farmers; but whenever separator creameries have been established on the co-operative plan, in localities where there are a sufficient number of cows within a radius of four miles, they have in every instance secured highly satisfactory results. Therefore, when considering the advisability of starting a creamery in any locality, the first thing to do is to ascertain if the required number of cows can be secured within a radius of four or five miles, which is about as far as milk can profitably be hauled. If less than four hundred cows are secured, we would advise that the project be dropped, as it is difficult to make it a success with less."

Today Minnesota is recognized as the leading state in co-operative butter manufacture and marketing. The early work of Haecker should receive no small measure of credit for this achievement. His vision, his preaching, his teaching, his untiring efforts brought results greater than even he anticipated.

(To be continued)

Multiply Your Man-Power By Seven



WHEN you go into the corn with a McCormick-Deering Vertical or Horizontal Corn Binder you are equipped to do the work of from 5 to 7 men with corn knives. And you sit in comfort while you are doing it. Instead of turning standing corn into loose, unwieldy stalks that are hard to load or shock, the McCormick-Deering bundles and ties the corn for fast handling without loss of labor or corn. This saves time at harvest and afterward.

If you feed silage you especially need the fast, sure work of the McCormick-Deering Corn Binder. With the binder in the field and a McCormick-Deering Ensilage Cutter at the silo every stalk can be turned into the highest grade of silage, at minimum cost, because the fast-working equipment handles the corn when it is at its best.

See the latest corn binder improvements in the McCormick-Deering, at the local dealer's store. He will also show you the McCormick-Deering Ensilage Cutter, in a size to suit your acreage. For use in corn borer infested territories, McCormick-Deering Corn Binders can be equipped with a special low-cutting device at slight additional cost.

McCormick-Deering Corn Binders are built in two types, horizontal [shown at the left] and vertical. Both are light-draft, long-lived machines that do hard work quickly and easily.

INTERNATIONAL HARVESTER COMPANY
606 So. Michigan Ave. of America (Incorporated) Chicago, Ill.

McCormick-Deering Ensilage Cutters —built in 5 sizes. Capacities, 3 to 25 tons of cut fodder an hour. All sizes have reliable safety devices, force feed, large throat, and heavy, large-capacity flywheels of boiler plate steel. Horsepower required ranges from 4 to 25 h. p.

The Dangerous Season

JULY AND AUGUST are the dangerous months for the dairy herd. Hot weather, swarms of flies, dried and shortened pastures all combine to throw cows into a slump. And a slump in milk production now will cut your profits in the Fall.

At this season of the year your herd must have plenty of shade, plenty of water and a good grain ration to provide the necessary nutrients not furnished by midsummer pastures. A simple mixture containing

Diamond Corn Gluten Meal

in a moderate quantity, say 25% of the whole, filled out with bran, ground oats and a little oilmeal—and fed morning and night—will bring your herd safely through the dangerous season.

WATERLOO - IOWA

Minnesota Plays Even

HOARD'S DAIRYMAN:—I own 240 acres in Winona County, Southeastern Minnesota. There are 175 acres under cultivation and I rent 40 acres of adjoining land. I am milking 16 Holstein cows (half are pure-bred) that averaged 322 lbs. fat in the local cow testing association for 1926. I raise 80 Chester White hogs a year and keep 100 White Wyandotte chickens. Have 14 acres of alfalfa started that is doing fine, and had 30 loads of alfalfa hay from seven acres last year. Other hay consists of clover and timothy, with 15 acres of mammoth clover raised for seed. My grain consists of oats, barley, winter wheat, and rye, and some wheat and flax.

My farm account for last year is as follows:

Inventory	March 1, 1926	March 1, 1927
Land and buildings	$25,185	$25,160
Live stock	4,440	4,605
Feed and grain	1,535	1,350
Machinery	2,385	2,920
Total	$33,545	$34,035

Receipts	
Grain	$1424
Dairy cows and hogs sold	2347
Butterfat	1872
Eggs and poultry	121
Sundry	401
Total cash	$6165
Increased inventory	490
Family food from farm	350
House rent	480
	$7485

Expenses	
Feed	$ 511
Machine work, twine, and seed	351
Machinery and equipment	264
Hired help	999
½ of auto expense	184
½ of telephone	30
½ of electricity	40
Sundry	116
Rent (40 acres)	414
Taxes	390
Total cash	$3299
Board for help at $25 per month	500
Interest at 5 per cent on inventory	1677
Total expense	$5476
Labor income	2009
	$7485

During this same year my living expense was as follows:

Personal family expense	$ 573
Household expense	322
Groceries and meat purchased	527
Life insurance, charity, etc.	192
Fuel	111
Food from farm	300
House rent	480
Total living expense	$2505

From this living expense should be deducted the $500 charged as board for hired men, in the regular farm account, leaving our personal family living expense at $2,005. This would indicate that my labor income was just sufficient to meet our living expense.

Minnesota. S.

New World's Champion Guernsey

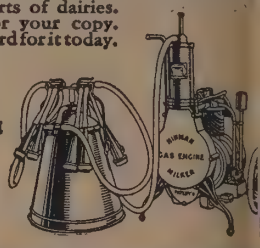
Charles W. Bosworth of Massachusetts bred and started on test the pure-bred cow, Bosworthfield Evelyn, in Class BBB (305-day record, milked twice daily, and carrying a calf for 230 days). When half way through her record, which was last September, he sold the cow to A. Heywood McAlpin of New Jersey, but kept the cow on her old home farm to complete the record.

She finished with the remarkable ten months' production of 11,006.4 lbs. of milk and 608.6 lbs. fat, or an average of over sixty pounds a month on twice daily milking, standing in the stanchion and running in pasture. —The American Guernsey Cattle Club.

A man too busy to take care of his health is like a mechanic too busy to take care of his tools.—Cicero.

yes Judge by Results

There's one best way to judge anything. That's by *results.*



And *that's* the way we ask *you* to judge the Hinman Milker.

The Hinman has had *nineteen years of unbroken success.* It was built around the *right* milking method at the start. Individual pump—*gradual* application of vacuum—complete release after each suction. Constantly improved and refined, it is today the *easiest* to clean, *better* for cows and most *economical* to operate. It is the *modern milker.* At the same time, you *know* it's the milker for practical, *continuous results.* Years have *proved* it so.

Send for the HINMAN CATALOG

It's a book you'll like. Shows you what the Hinman *has done* and therefore *can do for you.* Page after page of real *experience*—in all climates—under all conditions—on all sorts of dairies. Write for your copy. Drop a card for it today.

Veterinary Bacteriology

A new book on the subject of veterinary bacteriology has come to our attention. It is the work of Raymond A. Kelser, Veterinary Corps, U. S. Army. So few books in English are available on this subject that the coming of a new one, complete and up-to-date, should interest those concerned with the technical aspect of bacteria in relation to the prevention and control of bacterial diseases of animals, as also those engaged in public health work where animal diseases are involved. The book is too technical for laymen, but will be found helpful and interesting to students and practitioners. The price of the book is $5.50 postpaid. Copies may be secured from Hoard's Dairyman Book Department.

Uncle Ab says a smile is one thing that is about as blessed to give as to receive.

News From Washington, D. C.

[Special to Hoard's Dairyman.]

Washington, D. C., July 25—That successful aviators drink milk is not a coincidence which just happened to happen in the Lindbergh case, according to the further information which has been developed here since the successful trio of trans-Atlantic flights. All three airship commanders who landed safely in Europe use milk as their favorite beverages, if apparently bona fide interviews with them are to be believed.

The day following the arrival of Commander Byrd and his two assistants at their coast of France landing place, the newspaper cables flashed the message that his first request when he was taken to the home of the Mayor of Sur-le-Mer, was for a glass of milk. Lindbergh asked for a bottle of milk and a bath. A clever young lady assistant in the office of Dr. C. W. Larson, Chief of the Bureau of Dairy Industry, when she saw the Byrd story remarked that he did not need the bath. He landed in the English channel, it will be remembered.

The invitation from the dairy industry of Great Britain to participate in the World Dairy Congress next year in London has now been amplified by an invitation which has been received by the machinery and supply trade in this country to participate also in the special dairy exhibit which is to be set up by the British dairy folks in connection with the Royal Agricultural Exposition at Nottingham, England. This exposition is convenient of access from London, it is stated, and will be held during the week immediately following the official sessions of the Congress. Plans for the building and application blanks and full information have been received by the American Dairy Machinery and Supplies Association in New York.

The work which Dr. Dorset of the B. A. I. research staff has been doing in studying the composition of tuberculin, and which has been referred to informally in this correspondence, is now published in full in the current issue of the Journal of the American Veterinary Medical Association. As indicated, he has found that it consists of a lethal principle, capable of killing the guinea pigs used to test its strength, and another principle which reacts on the skin. It has been formerly tested as if composed of one principle only. Dr. Dorset indicates that the work has not proceeded far enough to reach definite conclusions, but indicates that greater testing efficiency may result from further successful work which will enable veterinarians to use a tuberculin which will have all possibilities of uncertainty eliminated.

Little prospective influence of the corn borer on the dairy industry is seen by the experts from the U. S. Department of Agriculture who attended the corn borer round-up meeting in Toledo, Ohio, last week. One of the sessions held at Toledo was taken part in by all of the live stock men present from Washington and the six states now afflicted with this pest. Their recommendations were along the line of using the corn shredder and the silo to kill the borers, and asking for information as to the additional cost of this method of handling cornstalks over field feeding, or using the stover as dry feed. It was not expected that the corn borer could be eliminated, it is reported, and it was felt that in cases of severe damage it might affect hog raising and induce greater keeping of cattle. For the immediate present, however, there was not thought to be serious danger of changing corn belt farm practice. Drs. Mohler of the Bureau of Animal Industry, Ball of Cereal Investigations, and Larson of the Bureau of Dairy Industry were among those in attendance.

Blanks for the nation wide survey of city ordinances concerning testing of cattle to insure T. B. free milk supply are going out this week. The U. S. Public Health Service will report on all cities above 10,000 population, while the state and county veterinarians will report as closely as possible on all municipalities below that figure. The results will be of value in measuring the public demand for T. B. tested milk.

—a name that means satisfaction to the tire user

EVER since the days of the rubber-tired buggy, the name "Kelly-Springfield" on a tire has been a sure indication to the purchaser that he might buy with confidence.

Kelly always has built good tires. Kelly is building better tires now than ever before. Hundreds of thousands of car-owners can testify to the truth of this statement.

If you are looking for the utmost in comfort and long mileage, try Kellys. Their price is no higher than that of many other tires of less reputation.

For car-owners who want value in a lower-priced tire, Kelly builds the Buckeye line of cords and balloon cords, tough, sturdy and generously sized.

"Kelly dealers everywhere—
there must be one in your town."

EDITORIAL COMMENT

TUBERCULIN TEST NOW

The New York Legislature enacted a law which authorizes competent veterinarians to tuberculin test dairy cows whose milk is marketed in liquid form or manufactured into butter, cheese, condensed milk, etc., and also to make physical examinations of these cows. The commissioner of agriculture has the power of ordering reacting animals or animals carrying communicable diseases to man or other animals, to be slaughtered or disposed of in such other manner as he may direct.

A law of this character is but a natural step in the trend of affairs for more wholesome dairy products. It will do much to get the owners of cattle to exercise more care in keeping their herds free from disease. The time is coming when the state and federal governments will not be as liberal as at present with indemnities to reimburse the farmer who loses cattle from tuberculosis. It is well for those who have not tuberculin tested their cattle to bear this in mind. Consumers are making larger demands as to the source of their milk supply and they are willing to pay a better price for it.

PROVEN SIRES

Because breeders do not fully comprehend the value of a proven sire, breeding is placed under a severe handicap. We are making progress in the development of better dairy cattle but not as much as we should. We should prove our bulls and then give those of outstanding breeding merit an opportunity to be used on a large number of cows. Nine-tenths of the bulls that have been able to increase production have gone to the butcher before they were discovered. This would not be the case if every owner of a pure-bred bull comprehended the meaning of a good bull and especially one that has shown himself able to get daughters superior to their dams.

According to cow testing association records, one-third of the pure-bred sires are lowering the production of their daughters in comparison with their dams. About one-third raise the production slightly, but the great increases are coming from only one-third of the pure-bred sires. In other words, we are only making progress about one-third as fast as it is possible to make it.

In a Wisconsin cow testing report our attention is called to a pure-bred bull whose first three daughters at two years of age produced, respectively, 484, 435.7, 407.4 lbs. of fat in a year; all were kept under herd conditions and not forced in any way to make unusual records. When their talent was discovered, the sire was immediately sought and it was found that some months before he had been sent to the butcher. If an ordinary, well bred bull is worth $250 to $300, a bull of this kind, handled in the right way, is worth at least many times this amount.

WHAT CO-OPERATIVES CANNOT DO

Writing on the subject of the possibilities and limitations of co-operative marketing, H. E. Erdman of the University of California has boldly pointed out some things about the limitations of co-operative marketing that should be learned by everyone who desires to lend his assistance to this great movement in the distribution of farm commodities.

He says of the limitations of co-operative marketing that no farmers' organization can fix the price at which the product is to be sold and sell all its product unless that price also suits the consumer. It must be remembered that there is probably no farm product of which the supply will not increase if a price is obtained that makes production unusually profitable as compared with other lines of farming.

A second fallacy frequently proposed by proponents of co-operative marketing is that middlemen will be eliminated. What frequently appears to be the elimination of middlemen is merely the replacing of a private business with a co-operative unit. Mr. Erdman says that no large organization has thus far eliminated any of the important steps in the marketing process. Many have brought several steps under one control but this has not always resulted in lower costs. Often it has meant better service, greater control over distribution, etc., so that in the end there has been a net gain.

It is often assumed that co-operative associations can do business more cheaply than can private agencies because it is expected to eliminate profits. To this, Mr. Erdman says that the important thing that is overlooked by those who hold this view, is the fact that profits in our competitive system arise out of the very fact that costs of operation have already been cut by those concerns which are making profits.

In addition to the above three definite limitations it is pointed out that there are a number of inherent weaknesses in co-operation which must be overcome by capable management if co-operative marketing is to be genuinely successful. These weaknesses are: (1) It is difficult for management and membership to keep in harmony. (2) Members become careless as co-operative citizens. (3) There is often a tendency towards extravagance. (4) Outsiders sometimes get higher prices than members. (5) Members of a new organization often expect too much.

WISCONSIN GRADED MILK

By the time this appears in print, the Wisconsin Department of Markets will have perfected the details of a plan for grading and trade-marking milk produced and marketed according to standards it established. It has adopted the standards prescribed by the United States Public Health Service for Grade A milk, both raw and pasteurized. No other grade of milk is provided for.

This plan was first initiated as a means of meeting the needs of local cities for milk grading, and several grades were originally provided. As the plan has eventually worked out, this condition will be left largely to the adoption of ordinances in the several cities throughout the state. A campaign for the adoption of the standard milk ordinance of the United States Public Health Service will be inaugurated in Wisconsin next September.

The right to sell milk under the trade-mark of "Wisconsin Grade A" will be granted to individuals or corporations that agree to supply the proper inspection and submit to the supervision of the Department of Markets. The local inspectors will be employees of the local concern, but their work must be approved by the inspector employed by the Department of Markets. While this system may be employed for local sales, it is now anticipated that it will most largely be used as a means of effecting out-of-state shipment of milk and cream to sections that will accept the grading and supervision as provided by the Wisconsin state authority.

It is reported that several eastern cities have signified interest in this proposal and will be willing to accept milk graded under specifications proposed. One large distributor already has a plant in Wisconsin that it desires to bring under this grading plan as soon as it is available. Several eastern cities are said to be suffering from a milk shortage, and milk and cream is being bootlegged into these communities that is not up to a reasonable standard of quality. If the proposed grading plan succeeds, it should obviate the necessity for this practice and remove some of the temptation to follow it.

FARM PEASANTRY

We do not entertain the fear, as some do, t we are generally drifting to farm peasantry. recognize we have farm problems difficult to s and we see opportunity for much improvement the necessity of establishing a different relat ship between agriculture and other industr Three outstanding factors in our country will vent the development of farm peasantry: first factor is the schools. Our farms are o pied by an intelligent and educated people standards of living and a desire for things w alone will prevent farm peasantry.

The second agency to prevent a decline in a culture is machinery. Through its use the Am can farmer has become the most efficient far in the world. One cause of our agricultural pression may be attributed to the increased ciency of the farmer made possible by impro machinery. Machinery takes the drudgery ou farm work and makes it a more pleasant occ tion. People trained in the use of machinery never become peasants.

The third factor working against a farm peas ry is the opportunity for people to change f one job to another. We have no castes in Ame A farm-reared boy has the opportunity to cha to innumerable positions. He may become a tor or a lawyer; he may engage in manufactu or in one of the various other professions numerous to mention. If our farm popula were bound to the soil as it was in the tw century, then we might entertain some fea farmers becoming peasants. Education, ma ery, and the interchange of jobs are the outst ing factors against a permanent decline in agr ture and the production of a farm peasantry. fact is, we are doing a better job of farming t than at any time in the period of our history. great work before us is to get the industr farming in proper relationship to other indust

GOOD ROADS

The more we have the more exacting we are the greater become our demands. Only a years ago this nation began to give serious sideration to building roads. A road was co ered good up to this time if it were passable greater part of the year. The advent of the a mobile had led people to demand the best h ways the world has ever known and if they not good at all seasons of the year, serious plaint is entered against the officials respon for our splendid road system. When the a mobile came into use, the motorist was sati to travel 15 or 20 miles an hour and any one traveled faster than this was a speed king was flirting with death. We now travel 40 m an hour and if the roads do not permit thi grow impatient.

A news letter put out by the Minnesota Hig way Department calls attention to the bad co tions of unpaved roads during the spring mo This department spent $224,000 for wage maintenance men last March compared to $9 March, 1926, and still the roads were poor unsatisfactory to those who used them. a spring was hard on many roads and it was im sible to keep them in shape, no matter how m work was done. The motorist, however, was patient and letters, newspapers, and commen ceived by the Minnesota Highway Departmen dicate that some people thought the maintenan men were not on the job this spring.

Such a state of mind clearly shows that ten is a uniform demand for good roads at all sea of the year. To build and maintain the kin road the motorist demands requires the expe ture of millions of dollars and it is our belief h those who use the roads most should maket largest contribution for building and maintain them. The gasoline tax is the ideal tax for h purpose. It makes the users of the roads pa for them, and what could be more equitable?

Whipping Cream

What should cream test to whip good? At what nperature should it be held?
Parson, Wyo. J. E.

There are three factors which are important in ipping cream. These are the richness, the age, l the temperature of the cream.

Cream testing approximately 25% fat will whip re easily than that which is less rich, but under st conditions it is felt safest to recommend am testing not less than 30%.

Cream ordinarily should be 24 hours to 48 rs old in order to whip properly. The whipping ality is improved by age up to the point where our taste is developed, but at 72 hours a maxim whip is usually obtained.

Not only should cream be sufficiently rich and iciently old, but it should be held at as low a nperature as possible, and the bowl and whipg utensil should be kept cold. Frequently cream t will not otherwise whip will do so if care is rcised to cool the beater and the bowl before ning in the cold cream.

Raw cream excels pasteurized cream in whipg qualities, particularly with cream that tests % or less.

Sugar, when added in amounts sufficient to eten, decreases the quality of the whip regardof whether added before or after whipping. voring extract added only in sufficient quanti to flavor does not affect the whipping quality the cream.

Viscogen, when properly used, increases the pping quality of either raw or pasteurized am and does not affect its flavor. It should not used, however, in cream which is intended for without first consulting local, state, and fedlaws in regard to its use and labeling. Viscois made by combining 2½ parts by weight cane sugar with 5 parts of water, while one of quick lime is slacked in three parts of wa-

These solutions are then thoroughly mixed allowed to stand for several hours. The result- clear liquid is then poured off into a tightly pered bottle and is added in requisite amounts he cream to be whipped. Care must be exerd not to use too much of the solution, as it give an off-flavor to the whipped cream. A mercial product of this character is on the ket under various trade names and is sold ugh many grocery stores.

hose desiring more complete information on subject should apply to the United States Dement of Agriculture, Washington, D. C., for etin No. 1075, entitled "The Whipping Quality Cream."

How to Make Bordeaux Mixture

E. Vaughan, Wisconsin College of Agricul-, gives the following information concerning leaux mixture:

ordeaux mixture is a standard fungicide for preventon of many plant diseases, such as poblight, grape black rot, and mildew. When ied under high pressure, Bordeaux makes a film over the leaf or fruit surface to be proed and kills the fungus growth as soon as it s Flea beetles and leaf hoppers are also red by Bordeaux mixture.

making up small amounts of Bordeaux for en use proceed as follows: Slake four ounces igh grade stone lime and dilute to about two ns, or take six ounces hydrated lime or limate make into a thin paste and dilute to two ns and strain into the sprayer; dissolve four es copper sulphate in a pint of hot water in o quart glass jar, dilute to two quarts, strain the dilute milk of lime solution and stir vigory. It is ready for use at once or may be kept some time by adding one-half ounce white r dissolved in a cup of water.

st Bordeaux before using to prevent injury to r foliage. This is done by putting a polished blade into the solution. If no copper is deed the spray is safe. A better test is to se a one or two-ounce bottle of ten per cent poum ferrocyanide solution and allow a drop or to fall on the mixture. If it remains yellow, spray is safe. If the knife blade turns copper ed or the ferrocyanide turns brown, add more to react with the copper sulphate to prevent y.

spraying several acres of potatoes it is customto make Bordeaux mixture in barrel or 100 n lots. In the case of barrel lots where hyd lime or limate is used proceed as follows: ssolve the copper sulphate at the rate of one d to one gallon of water in any wooden keg or barrel, using four pounds of copper sulphate for each barrel lot of spray desired. This should be done long enough before spraying so that the crystals will have gone into solution. The easiest way is to suspend the crystals in a flour sack touching the top of the water the night before the spray is needed. A gunny sack may be used if it is clean and free from lint. Start water running into the sprayer, take six pounds of hydrated lime or limate, mix with water to make a thin paste and pour into the sprayer through a strainer. Stop water running into the barrel when it is about nine-tenths full and stir thoroughly while adding four gallons of the stock solution of copper sulphate through a strainer. This stirring or pumping the mixture into itself, while adding the copper sulphate, is highly desirable in making an efficient Bordeaux. Fill the barrel with water or an arsenical solution if insects are present.

This method of mixing does away with the elevated mixing platforms formerly recommended and is the method now used by most of the large fruit growers. Straining the solutions that go into the sprayer prevents the entrance of coarse particles that would clog the spray nozzles.

Satisfactory commercial preparations of Bordeaux are on the market either with or without an arsenical added. They cost somewhat more than home-made Bordeaux but are not as much bother to prepare. When only a few gallons of spray are needed the commercial mixtures are preferred if they can be obtained when fresh.

Examine the spray outfit before starting. Make sure that connections are tight, that working parts are well greased and have discs renewed if necessary. It is impossible to get good results when the equipment is out of adjustment.

Partition in Silo

Some time ago I read in Hoard's Dairyman an article or discussion on the advisability of dividing a large silo in two to accommodate a small herd of cows. We now are in need of information on this subject. Our barns burned down a month ago and if we rebuild it will have to be on a smaller scale.

The silo is a 14-ft. hollow tile. Do you recommend dividing a silo and can you give us any definite information on how to do it.
Baldwinsville, N. Y. L. J. J.

The building of a partition through a silo can not be recommended, although we have had a few reports indicating success with this method. The difficulty with a partition is that the silage is inclined to settle unevenly, which results in considerable spoilage even if the attempt is made to round the corners. The worst feature, however, is the difficulty of building a partition sufficiently strong to withstand the outward pressure of the ensiled material. This may be overcome in part if each side of the silo is filled at the same time. It is possible that a reinforced concrete partition properly anchored into the side walls of the present silo may withstand this pressure but this would prove a rather expensive undertaking and we can not advise it in the light of the reported experience with spoiled silage.

There have been several methods suggested for handling silage to keep it from spoiling where relatively few head of stock are being fed. One of these is to feed down one-half of the diameter of the silo for a week or more and then clean off what is spoiled on the other half and feed this down, alternating in this manner from side to side. There is some spoilage in this manner of handling but it can be partly obviated by covering the unused half with tar paper, canvas, feed sacks, wheat straw, or other material that will exclude the air. If paper or canvas is used it will be necessary to put weight, such as spoiled silage or something that will hold it down tightly to the surface, to exclude the air.

One of our readers reports success by first feeding from the front of the silo down two or three feet, then throwing the spoiled silage from the back half over the good silage in front and tramping it down thoroughly, wetting if necessary to make it pack. Then feed the back down until it is two or three feet lower than the front. Then throw back the same spoiled silage and keep on with this practice until the silo is empty. He reports that this reduces spoilage to a minimum.

Other men have used a system of taking off alternate halves of the silage every other day, keeping the unused half covered as under the previous plan. Some of our readers have reported satisfactory results by sprinkling two or three pails of water over the silage after taking off one feeding. This seems to help if care has been exercised in not loosening up the silage left in the silo after taking off the layer for feeding purposes.

Using Hay Caps

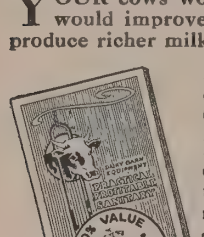
A couple of years ago I made a purchase of some army pup tents expecting to use them as covers for alfalfa cocked hay. I am a little uncertain as to whether you weight the corners with the weights to keep the covers from blowing off or whether you anchor them in the ground with steel wire stakes or something of that kind.

How near cured do you allow the alfalfa to become before you cock it up?
La Porte, Ind. G. L. M.

Hay caps are ordinarily made from forty inches to forty-eight inches square. The most usual system is to attach the weights to the caps by means of a string, using either binder twine or some other heavy cord. In some cases wire is used for attaching these weights and eyelets inserted in each corner of the cap. Light galvanized wire is cut into 10-inch lengths with a hook on either end. Sometimes one end of the wire is inserted into the cement weight when made and the weights are then merely attached to the cap through the eyelets when the cock is being covered and taken off when the cap is removed.

Cement weights are made in a variety of sizes using a mixture of fine screened sand and cement in the proportion of three to one. The weights should be about eight ounces, which will mean a cement ball some two or two and a quarter inches in diameter. The weights may be molded by the use of small paper sacks or by using a piece of wood about two and a half inches in diameter with one end rounded like a potato masher. Drive this into the ground about two and a half inches and the resulting hole makes a good mold. Other men have suggested the use of eaves trough, partitioning it off with shingles set in at the proper distance so as to make the weights of from eight to twelve ounces. One convenient method of attaching either strings or wire to the cement weight is to bend over the ends of a common wire staple and insert into the cement mixture before it hardens.

Some men have used wire stakes and report excellent success with this method. No. 9 galvanized iron wire is cut into 10-inch lengths and bent into the shape of a fish hook at one end and with an eyelet at the other. The eyelet is fastened to a corner of the cap with a piece of twine. When the hay is cocked the cap is thrown over the top and each corner of the cock is lifted with the left hand and the hook in the corner is caught underneath. The operation is repeated with each corner of the cap and in this way the cap is not only held on but the hay is held so that just a small portion of it lies directly on the ground. Another reader reports the use of No. 12 galvanized wire cut in 9-inch lengths, and it would seem that the heavier wire would be preferable. It is plain that the use of this method of attaching the hay cap does away with the difficulty of tangled strings that result when the weights are attached with cord. However, when cord is used, a good deal of this difficulty can be avoided by exercising care in picking up the hay cap weights, putting them in the center of the cap, and then lifting and putting it away by taking up each corner of the cap.



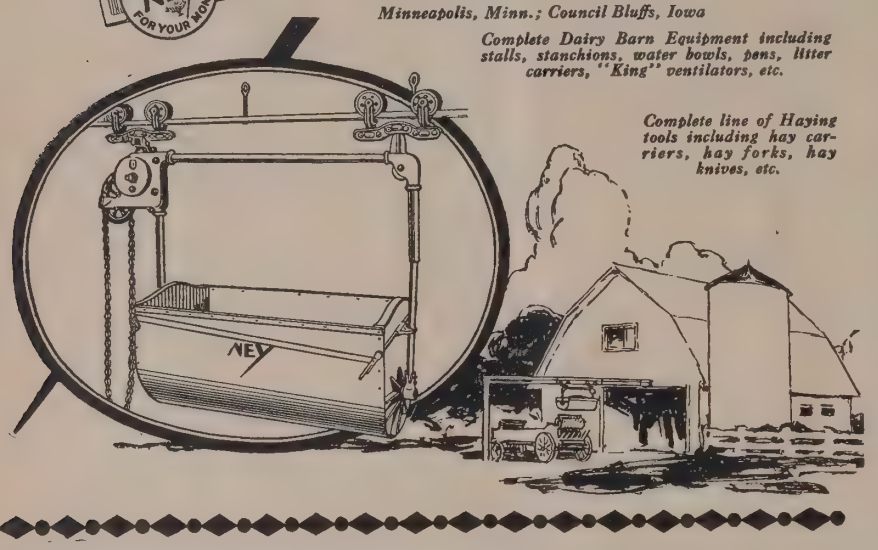
Up until the last two years we have used hay caps exclusively on the Hoard's Dairyman farm and we believe they are a very desirable thing. However, the increasing amount of labor required to take care of the alfalfa hay together with the competing cultivation of corn, have lead us to adopt the use of the side-delivery rake and the windrow hay loader. This expedites the handling of the crop and we secure a good quality of hay. Possibly the hay is not of quite as high grade as when cured under caps, but is more economical.

When alfalfa or clover is cured by the cap method, it is a general rule to cut it in the morning, allowing the hay to stand in the swath until it is well wilted and then late the same day or the following day the hay is raked up, put into cocks of from 80 to 100 pounds, and immediately capped. The hay is allowed to cure in cocks for two or more days depending on the kind of weather that may obtain. If rains intervene, it will be necessary to move these hay cocks every four or six days to prevent the smothering out of the alfalfa plants beneath. Before loading, the cocks are spread open or merely turned over on the side to permit drying out of the interior. The length of time the hay is to lie in the swath will depend to a considerable degree upon the dryness of the weather that may or may not obtain.

NEY

If your cows could talk—

YOUR cows would tell you that modern sanitary dairy barn equipment would improve their health and make them happier. Enable them to produce richer milk—and make more profits for you.



Ney Litter Carriers eliminate all the back-breaking drudgery in keeping the dairy barn clean and sanitary. Cut in half the time and labor spent doing barn chores.

Ney Dairy Barn Equipment is sold by reputable dealers everywhere. The Ney Catalog No. 54 points the way to bigger milk profits. Write today for your copy and name of dealer ready to serve you.

What Co-operation Must B

JOHN A. COMMONS, WISCONSIN

WHAT dairy co-operation must be in this modern day has just been stated in Chicago. Officers, members, students, and statisticians of co-operative associations came from 39 states and from many foreign lands to pool their experiences, their problems, and their solutions. The American Institute of Co-operation, farmer supported and farmer controlled, provided place and program during its dairy products week. The papers, the floor discussions, the conferences, and the conclusions of long practical experience and of accurate scientific study, portray the lines of successful progress and hopeful promise of meeting the large problems of the dairy farmer.

In the space available here it is impossible to do justice to the significance of the meetings or full appreciation of the eminent contributions given by men known throughout the dairy marketing world. The inclusion of McGuire of Land O' Lakes, Swoboda of Wisconsin's Cheese Federation, Heaps, Hough, Pattee, Eastlack, and others from the successful fluid milk associations of the East, Miller of the Dairymen's League, Beach of the Michigan Producers, and Lynch of the Illinois Agricultural Association, vouches for the representation of real co-operative leaders. Schoenfeld, Jones, McKay, Larson, and Tenny of the Department of Agriculture are names that indicate to those who know their work the scientific accuracy of the data considered and the conclusions reached. Erdman, Horner, Bakken, King, and Stitts, from universities of California, Michigan, Wisconsin, Pennsylvania, and Minnesota contributed the work of educational institutions upon the problems. Woolman, of the largest Philadelphia dealer company; King, of the London Office of the Australian Butter Control Board; Thompsen, of the Springfield Intermediate Credit Bank, and many state and federal marketing officials gave the picture of foreign and domestic relations of dairy co-operation to governmental regulation and legal limitations. The joint and collective conclusions of this group are authoritative. Probably never has there been so large a voluntary gathering of those who are working for the dairy co-operation movement to succeed. Never have the accomplishments, the troubles, and the proper lines of future progress been so thoroughly, frankly, and authoritatively considered in the dairy world.

The keynote of the week's discussion was that large memberships, large volumes, high quality product, and low per unit costs are not enough for successful co-operation. Policy and outlook must expand, as well as size and scope. However large the farmers' association, it cannot long force distributors and consumers to do what they do not want to do. Co-operation must be not only between members, but between producers, distributors, and consumers. All must be gotten together in their common interests. Their differences are insignificant. The market is not a place to fight, but is a place to co-operate with everyone concerned.

Concrete illustration is in the success of the eastern fluid milk associations. Getting together with dealers and representatives of the public has resulted in equalized production and consumption, stabilized price, lower spread between farm and retail price, and raising of farm price without disturbance of retail price.

The same applies to markets for other products. Of all dairy kets, the fluid market can be trolled by associations in greate gree. If it won't work in a milk market, it is suicide in the keting of another product. This not mean form of organization tivity in selling. What suits one ket or one product may or ma suit another market or another uct. Identical plans are not for fluid milk and manufac products. This needs no emphasis throughout the whole dairy ma ing field the policy of consci considering, respecting, and bett the interests of all parties to the ket is nowadays essential to su

Another supreme note of the ings was the laying to eternal re the bogey of surplus. The fluid associations fear a shortage than a surplus. Stabilization of ket conditions requires daily s sufficient to meet fluctuating mands. If lacking, consumers, th dealers, go beyond the bound of the co-operative to the dow of the association. The daily plus and the seasonal surplus c handled in other ways.

In the field of manufactured products, co-operative associ leaders find the same thing. The plus problem is one of utilizin markets for the many manufac products. Its solution is the ga ing of market information, its ca interpretation from day to day the organization and equipme the association to allow not on version of one product from m to market as each appears to more or less permanent advan but to shift from product to pr with equal facility. For this dination of manufacturing and keting effort there is required th cilities and the highly skilled ma ment possible only to large orga tions.

In general the attendants a dairy week felt that the structu the organization was not of sup importance, as long as it al ready and adequate finance, sentative directorship, and auth tive and responsible manage They deprecated attempts by organizations to rapidly assum market functions. They showed clusively their belief that the trouble with the marketing s was the irregularity with products were supplied for sale. ularization of this flow in each ket, between markets, and bet products is the province of the erative association, the desire dealer, and the need of the con er.

The general stress of the mee as far as human participation operative marketing is conce was on management. Proper or zation is worthless without lent management. Operation and activities are wasteful wi direction and, what is of supren portance, control by efficient, ness trained management. So o plex are the interrelations o modern market systems that high fection of market training is tial if improvement in marketi to come from co-operation. Th provement is the goal, is in the of these co-operators who met in cago.

It was not in generalities that the conferences were conce Space permits no excursion int fine discussions of detailed pro of every phase of dairy produc

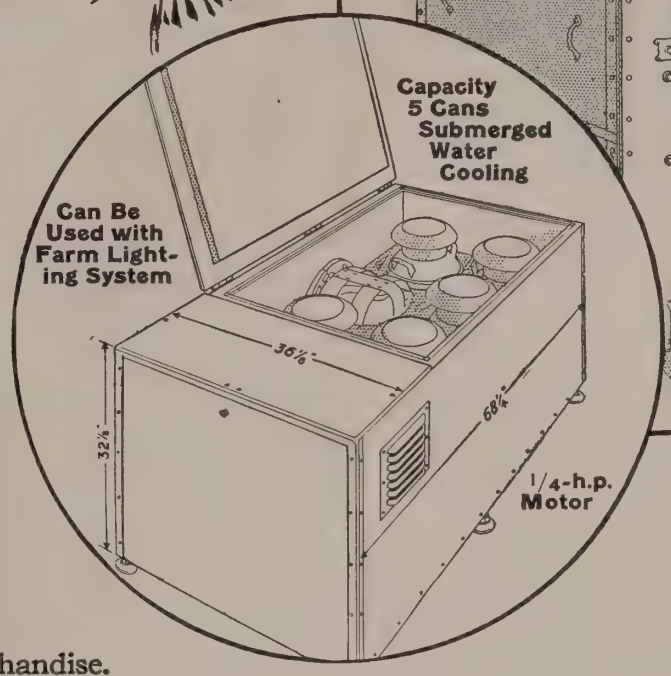
Of Champion Ancestry



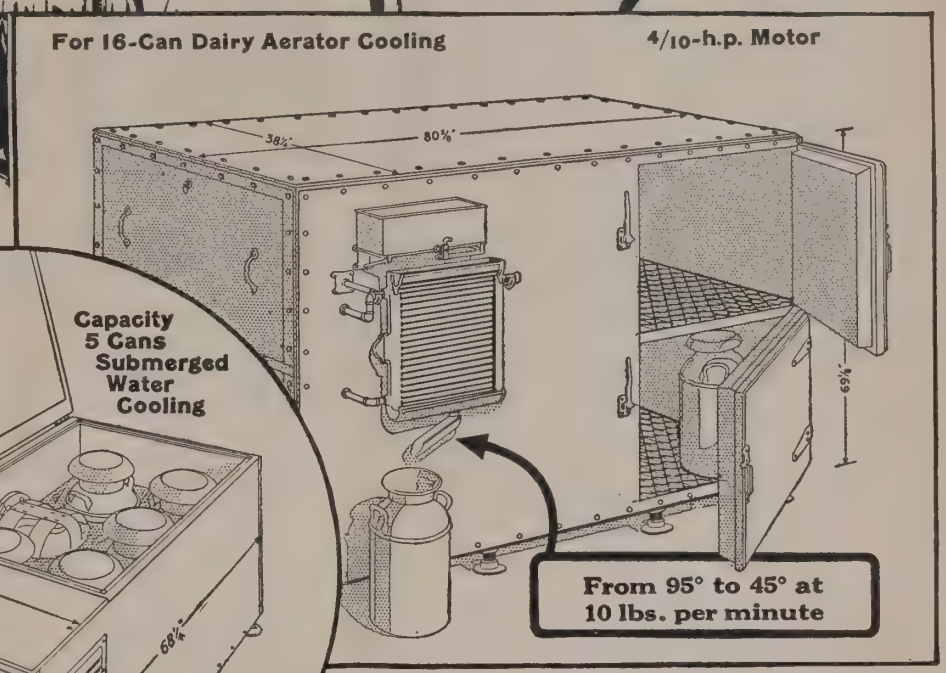
Nizer-Kelvinator Electric Milk Coolers Save Time Save Money Save Labor

elvinator pioneered the first suc-ssful system of electric refrigera-n. It has a record of twelve years successes in thousands upon ousands of homes, and its name favorably known to every house-fe. Nizer pioneered the electric binet for ice cream and has led in ery practical development in the eservation of this perishable merchandise.

zer-Kelvinator Electric Milk Coolers are champion ancestry. The brain child of e foremost engineers in electric refrigera-n! You can depend on them to be prac-al savers of time, money and labor. No re troublesome ice harvesting. No ex-nsive ice houses. Save worry. Save rejec-ns on receiving station platforms.

Proved Practical

zer-Kelvinator Electric Milk Coolers have been ted under the most rigid dairy farm conditions. fore offering them to you, they have been proved ctical, economical and efficient.



2 Sizes, 2 Types

There are two sizes and two types—the aerator cooler for dairies up to 16-can production and the submersion type for dairies with a production up to 5 cans. Each is ruggedly built to stand up under farm use for years. Economical to operate.

Ask Your Milk Dealer

Your milk dealer will be glad to tell you about Nizer-Kelvinator Electric Milk Coolers. You can obtain them direct through him or through most Kelvinator Dealers. Or, if you prefer, write direct to the nearest Nizer branch for a folder, fully descriptive of each cooler.

Your chance to get $500.00 free for a name

Nizer-Kelvinator will pay $500.00 in gold for an appropriate name. It must be a good name—a real dairy farm name that any dairy farmer would recognize as describing practical electric dairy coolers.

Beautiful Kelvinator for Second Prize

The famous "Sealtite" Cabinet Kelvinator Model 272—gray, steel-clad, white enamel lined, two inches corkboard insulation. Equipped with the first successful domestic electric refrigeration. Just the thing for the farm kitchen. Ample food storage space, light, clean. Gives "cold that keeps" without attention. Sells for $210.00 ordinarily and is the outstanding household value in electric refrigeration today.

Write for a Descriptive Folder

The name you submit will have a better chance if you know all you can about Nizer-Kelvinator Electric Milk Coolers. Send for a folder today. Clip the coupon and send in your name. You can send in as many as you wish. No restrictions except that you are in some way connected with a dairy farm and fill in the coupon.

A fair and square contest, judged by men you know: Harry A. Sieck, General Salesmanager of Nizer and Vice-President of Kelvinator, Inc.; W. A. Schreyer, Business Manager of Dairymen's League News; W. C. D'Arcy, D'Arcy Advertising Company, and Gordon Muir, Advertising Manager of Nizer.

All names must be in the offices of Nizer Division, Electric Refrigeration Corporation, Detroit, Michigan, by noon Monday, August 15th. The names of the winners will be published in this publication by September 15th.

NIZER Kelvinator

REG. U. S. PATENT OFFICE

THE PRACTICAL ELECTRIC MILK COOLER

Sold to or through Milk Dealers by Nizer Division, Electric Refrigeration Corporation, also by most Kelvinator Dealers, and in Canada by Kelvinator of Canada, Ltd., London, Ont.

Nizer Sales and Service

14210 Plymouth Road, Detroit

Neighborly Notes

'Twas picnicking time again and for several weeks the children had been begging for a picnic, a real, true picnic. And now father had his work in shape so that he could take a day off and the whole family was going on a spree! It had been quite a task to choose where to go—the boys wanted to go to the "crick" and the girls to a nearby city where there was a zoo. Dad rather preferred just to start out and drive and drive with no place in view, (of course, he had a sneaky notion of which way he'd head for but he wasn't telling for very good reasons). Mother, dear soul, let the whole family wrangle to their hearts content before she stepped in and took the helm, as usual.

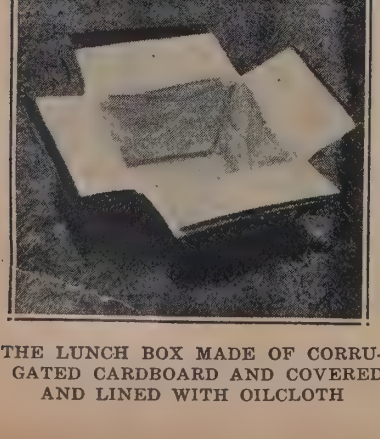
"Listen, everyone, please. You know for quite a long time we have wanted to drive to Lake Geneva and spend the day there and take the boat trip around the lake and see all those beautiful estates. How would you like to do that?" And the vote was unanimous in favor of it. Even Dad was well pleased.

How busy mother had been all the day before planning for it and working on some mysterious looking box affair! But she would not let a soul in on her secret, not even dad. Of course she baked, too, such good smelling things that they all got hungry at once. They could hardly wait for the morrow to come. The children spent the day planning just what they would wear and say and do. Dad cleaned the old car up so that it fairly shone and filled it full of gas, oil, water, and air.

Early the next morning they were ready to start. Mother had been up since four o'clock and all of the lunch was packed before the children were awake. Father came in to carry out the various baskets, pails, boxes, etc., that were always a part of every such trip—and generally by the time these were all assembled the family had no room left for themselves and as Bud said, "They had to drape themselves on the roof." But today there was no such array, only one large neat looking box of black oilcloth stood ready to go.

"Strap it on the running board, dad, and then we'll all have plenty of room inside for once," mother called.

"Yes, but where's all the rest of the stuff?" dad insisted. "We always have so much luggage a fellow can't get in."



"That's all," mother assured him. "That's my surprise. It's all packed in that one box. And wait till you see the inside."

It was hard waiting. Even dad scoffed at the idea of that one box holding enough for six of them to eat. He reckoned they'd all starve and maybe have to go to one of those swell hotels around the lake. The ride was one long to be remembered, for it was a beautiful day of sunshine and clear blue sky, just warm enough for comfort. And the thrill they all got as they drove up to the lake and looked across the expanse of deep, blue water! Far off a yacht or two could be seen and one or two trim little motor boats plied back and forth nearer at hand. They could just catch a glimpse of a few beautiful homes and grounds from where they were parked, but in the afternoon they were going to see all of those magnificent homes which are owned by the millionaires of Chicago and elsewhere. For the mail boat, on which they were planning to take the trip, would stop at every dock with mail and they could get a good glimpse of each place. But for the present they wanted to eat worse than anything else.

Dad carried the large black oilcloth box over to one of the tables which was built in the park by the lake, and mother proceeded to unpack it. The family certainly was astonished as mother showed them the lunch case and its contents. The box itself measured 18 inches in length, 15 inches in width, and 12 inches in depth. It was made of heavy corrugated cardboard, and the top opened in four sections. Mother had spent several hours covering the entire outside of the box, including these four flaps for the top, with black oilcloth and the inside with white oilcloth. She had fastened stout tapes to the flaps and to the sides of the box in such a manner that the whole case could be securely fastened shut when filled, and closed, and in this way was absolutely dust-proof.

First, mother drew forth an old white tablecloth which she spread out on the table and then paper plates, napkins, and cups—which could easily be disposed of after the meal. Then from a pocket on one side of the box she produced the silverware. The children helped to set forth the food as she brought it forth from this ample container, stacks and stacks of sandwiches wrapped in wax paper, graham ones with lettuce in for dad, peanut butter ones for Bud, cold boiled ham sandwiches for Mary, and cheese ones for Jim, and then a few made of chopped nuts and olives and pickles for Ruth. Then came the lovely brown roast chicken, and the pans of scalloped potatoes and baked beans which were still warm for they had been wrapped so well in thick layers of newspaper. There were pickles, radishes, cookies, doughnuts, apple pie so flaky and tender, nut cake, bananas, and oranges. From the thermos bottle mother produced piping hot coffee for herself and Dad and from a quart jar milk for the kiddies. Each side of the box held one or two pockets of white oilcloth and from these she produced envelopes of salt and pepper, a small glass jar of sugar and from the last pocket a wet wash rag, a bit of soap, and a small face towel. Mother had thought of everything.

"Some day I'm going to have a thermos jug," mother told them. "Then I can bring along a gallon of hot creamed chicken or hot soup, or most anything. Why, Addie even makes chicken and dumplings and carries them in her thermos jug. Then we'll have a picnic outfit no one can beat. But for the present, this does pretty well. You know for years I've wanted a real picnic lunch case but they cost about $35 to buy. So for quite a while I've been planning this, and I've done pretty well." And they all agreed.—ETHEL MORRISON MARSDEN.

THE LUNCH BOX MADE OF CORRUGATED CARDBOARD AND COVERED AND LINED WITH OILCLOTH

Green Tomato Soy

A couple of years ago I was making a trip through California and, like all tourists, I was much interested in the missions. The farthest north of any that I visited was the one at Sonoma located in the same county with Santa Rosa, made famous by being the home of Luther Burbank.

The mission, as we drove up, looked like several of its sister missions in that it seemed to consist of a chapel-like part well restored and in good condition, placed at right angles to a long colonnade. But what other mission had we visited that had had that look of utter cleanness, scrubbed to the last degree and on top of that, that tantalizing odor of something cooking—something that reminded a person from a colder state of snowed-in nights with sizzling ham for supper and a tart sauce to go with it!

A guide met us—Mrs. A. J. Borie—dressed in a crisp gingham dress with a soft white cap on her gray hair—as different as possible from all the other guides we had seen, interesting as they were. She told us stories of the early days of Indians, of Mexicans, of migrations, and led

(Continued on next page)

Fall Fashion Book Ready

You simply must have a copy of our Fall Fashion Magazine, for it contains too many good things for you to miss.

All the new fall and early winter styles of course, and then there are pages of novelties such as costume outfits for the masquerade party. Christmas gifts you can make at home, including toys for the children, such as Little Red Riding Hood, The Three Bears, etc., etc.

Articles about health and beauty and reducing safely, and pages showing correct hats, fancy needlework, special styles for stouts, styles for the older woman, the new lingerie, etc.

Every woman should have a copy of this book for it points the correct way to fashions. While you have the matter in mind, send 10 cents for your copy now to Fashion Dept., Hoard's Dairyman, Fort Atkinson, Wis.

Miscellaneous Fashions

No. 3018—Flattering Square Neckline. in sizes 38, 40, 42, 44, 46, and 48 inches measure. The 44-inch size requires 3⅜ y of 40-inch material with 1⅝ yards of 18- contrasting.

No. 2334—Suitable for Stout Figures. in sizes 36, 38, 40, 42, 44, 46, 48, 50, an inches bust measure. The 36-inch size quires 2⅞ yards of 40-inch material wit yard of 36-inch contrasting.

No. 2987—Plaits Add Distinction. Cut sizes 16, 18 years, 36, 38, 40, and 42 in bust measure. The 36-inch size requir yards of 40-inch material.

us from end to end of the mission.

Finally we could stand it no longer. "What is that wonderful smell coming from?" we asked. Missions were dead and gone things compared to that.

"Why, that is my green tomato soy," she replied, "and I think it is just ready to come off the stove. Would you like a taste?"

Would we? Just try us. We trooped with her along the long colonnade where thousands of Indian feet had trod in those early days, back to her immaculate little kitchen where the huge kettle of soy was bubbling. We felt like children getting our "taste" and I couldn't help feeling that when I got big I wanted to be a guide in a California mission and cook green tomato soy so that I could make visitors have that at-home feeling that Mrs. Borie made us have. Here is her recipe and it is delicious:

2 gallons green tomatoes sliced
12 large onions sliced
1 quart sugar
2 tablespoons dry mustard
2 tablespoons salt
2 tablespoons pepper
1 tablespoon allspice
1 tablespoon cloves
2 quarts vinegar
Cook three hours.

—LUCY THOMPSON.

Ladies, Attention!

Do you like to embroider? If so, why not try the stamped articles advertised on the color page in our June 25 issue? We know you will be pleased with them for they come already cut and stamped with instructions for embroidering. The child's dress is ready to wear. They are not only useful but beautiful in design.

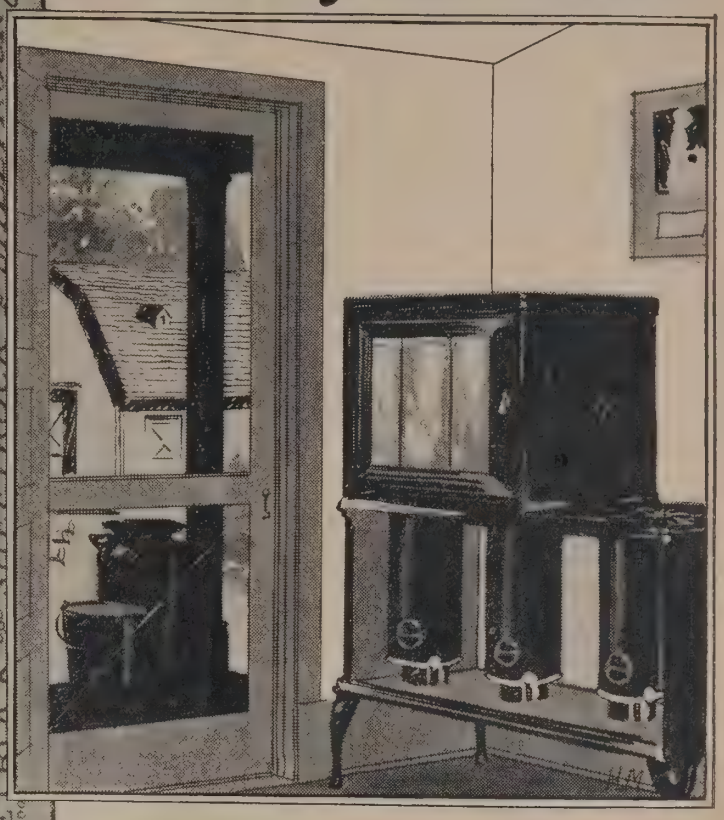
We will fill your order promptly as we have these articles on hand ready to mail.—Hoard's Dairyman Fashion Department, Ft. Atkinson, Wisconsin.

The Right Book for Him

I heard a man telling a story the other day that he thought was a great joke. A man went into a book store and looked around for a moment in a puzzled fashion.

"Is there something you wish?" asked a clerk.

"Well, yes," the man replied. "I would like to get a book suitable for a man about to be married."



"Yes, sir," the clerk replied. "Here, Mr. Smith, show this gentleman some of our large size pocketbooks."

The jokes all run to the effect that it is the man who makes the money and the woman who spends it, but wouldn't it be interesting to know just who really does spend the money and what it is spent for. Certainly the average woman does not spend it for frills and furbelows for herself as the jokes intimate, because in most cases she has a hard enough time stretching it around to cover the most necessary articles of food and clothing.

Man still likes to keep his hand on the purse strings and to have the world at large think of the money as his but look around you and see if, after all, it isn't the women who do the actual spending.—LUCY THOMPSON.

MINNETONNA
HOME BUTTER MAKER

A WONDERFULLY efficient butter making machine built on the same working principles as the machines used in large creameries, differing only in size and price.

It gets all the butterfat out of the cream. It churns rapidly so the butter comes in from one-half to one-fourth of the time. By simply throwing in clean water and giving a few turns, you remove all buttermilk. Instead of working the moisture *out*, the MINNETONNA works the moisture *in*, so necessary to the flavor and the keeping qualities, and giving an "over-run" (of moisture and salt) of from 20 to 25 per cent above butterfat test. Hence *more* and *better* butter.

Churning capacity 3 to 12 gallons. Working capacity 3 to 20 lbs. Larger sizes up to 100 lbs. capacity.

Write for description and for FREE 320-page catalogue of Dairy Goods.

CHURNS THE BUTTER AND WORKS IT.

INCREASE DAIRY PROFITS with Thompson's MINERAL FEEDS

Feeding Thompson Minerals as a regular part of your cow's rations will mean better health, more milk, bigger profits from your herd.

They are carefully compounded from the choicest and purest minerals; each ingredient serves a specific purpose —none of them should be omitted from a properly balanced mineral feed. Animals relish them and they are easily assimilated.

Thompson's Dairy Minerals improve digestive functions, tone up the system, help make breeding surer, enable cows to have healthier, better boned, and more vigorous calves, and are a valuable preventive of goitre. They promote increased milk flow and longer lactation.

Experiment stations recommend them—good breeders use them

Put up, without filler, in leak-proof, fibre-lined sacks, and sold by leading dealers at very attractive prices.

If unable to secure a supply readily, write for literature on our Dairy, Swine, and Poultry Minerals, giving your dealer's name.

DAIRY MARKET NEWS

Feed Market Situation

(By the Grain, Hay, and Feed Market News Service, U. S. Bureau of Agricultural Economics.)

Continued strength in the feed grain markets, together with only a moderate output of most feeds, held feedstuff prices practically steady during mid-July with strength in the heavier wheat feeds offsetting the seasonal decline in cottonseed meal. It appears that production of gluten feed and hominy feed have not been large and linseed meal production has been restricted by the small volume of fresh orders for linseed oil. The increase of around 3.5 per cent in the spring pig crop was also a strengthening factor in the feed situation and prices of most feeds made fractional advances during the month while middlings and the heavier wheat feeds were sharply higher.

Production has shown a seasonal increase in the Southwest where new crop wheat is being ground and prices are turning easier in that section, although the poor crop of hard winter wheat in the far Southwest has helped to restrict grindings there. The output at Minneapolis continues light and has been readily absorbed. Hardly any wheat feeds have gone into storage from the Northwest up to this time, an unusual condition. Demand has been active in the Northeast and the eastern North Central States and Buffalo mills have sold their output through August and are three weeks behind on deliveries. Bran prices have held practically steady while middlings at some markets have advanced as much as $3 a ton.

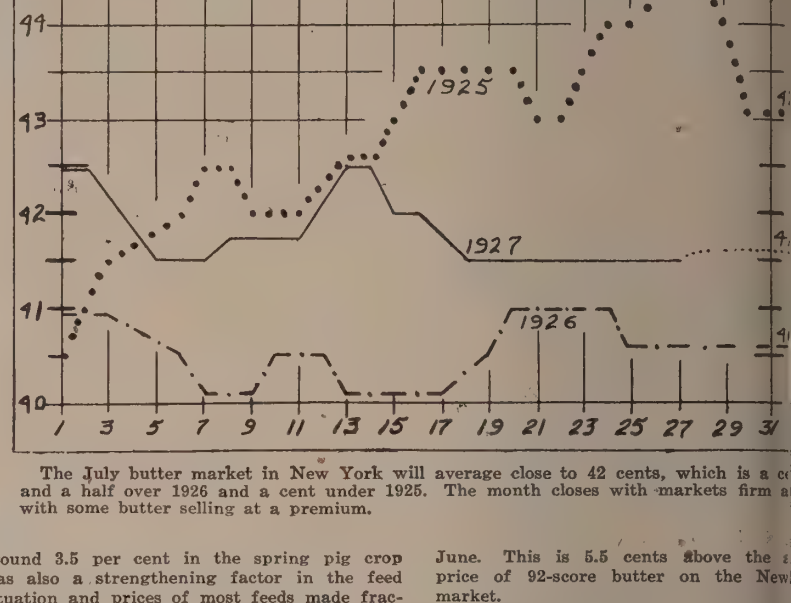
Material dullness has been shown in the market for painting materials and fresh inquiries for linseed oil have continued light. This has restricted crushings and only small amounts of linseed meal have become available. Even these limited offerings have been ample for current needs at Buffalo but demand recently turned more active in the Northwest and prices were advanced fractionally at Minneapolis where mills were reported to have sold their current output for some time ahead.

Cottonseed meal prices showed a seasonal decline, largely because of the approach of new crop meal movement. Southern Texas farmers are now marketing the first of their 1927 cottonseed crop and offers of new crop meal for deferred shipment to northern markets were becoming more numerous at prices materially under old crop quotations. The supply of cottonseed meal this coming season will doubtless be considerably smaller than last year.

Gluten feed quotations were unchanged at Buffalo where offerings of this feed were liberal and the demand rather slow. Reports indicate that the high price of domestic corn has led one manufacturer to purchase around 750,000 bushels of Argentine corn for use at an eastern plant. This will doubtless increase the amount of gluten feed offered in eastern territory.

Quoted July 25

Standard spring wheat bran: $29.50 at Buffalo, $32.75 at Philadelphia, $27.75 at Chicago, $25 at Minneapolis. Hard winter wheat bran: $31 Buffalo, $30 Cincinnati, $23.75 Omaha, $24.50 Kansas City. Soft winter wheat bran: $32 Buffalo, $31 Cincinnati, $26.50 St. Louis.



Standard wheat middlings: $35.50 Buffalo, $39.50 Philadelphia, $35 Chicago, $32.25 Minneapolis. Soft winter wheat middlings: $37.50 Cincinnati, $37.00 St. Louis. Gray shorts: $35 Omaha, $34.50 Kansas City.

Cottonseed meal (43%): $44.50 Buffalo, $45.50 Philadelphia, $41.50 Chicago, $41.10 Omaha, $39.90 Kansas City, $32.50 Fort Worth.

Linseed meal (34%): $45.50 Buffalo, $45.25 Chicago, $46 Minneapolis.

Gluten feed: $35 Buffalo. White Hominy: $38.50 Buffalo, $40.25 Philadelphia, $37.5 cinnati, $36 Chicago, $34 Omaha.

Alfalfa meal: $28.50 Cincinnati, $25. Louis, $26 Chicago, $23 Omaha, $22 City.

The July butter market in New York will average close to 42 cents, which is a c and a half over 1926 and a cent under 1925. The month closes with markets firm a with some butter selling at a premium.

Twin City June Milk

The Twin City Milk Producers' Asso of Minnesota paid $2.31 a hundred for milk delivered in St. Paul during June association handled 30,838,456 lbs. mi which 61% was surplus.

Cream patrons were paid 48 cents a for butterfat in first grade cream

Butter and Cheese in J

Butter averaged 41.8 cents in New Y the first four weeks of July, a decline o ly one cent from June. For the first ti year the monthly price is under that years ago, but it is still over a cent ab 40.5-cent average last year. Production clining slowly, but receipts since Jan the four markets are a hundred thousa in excess of the same period last year.

Cheese prices have maintained a re higher level than butter during the year, the average for July being 22.3 c June. This is 5.5 cents above the price of 92-score butter on the New market.

Connecticut July Milk

The Connecticut Milk Producers' Association announces the following prices for Grade B milk delivered during July at market milk centers:

All milk sold in fluid form, 9.5 cents per quart for 4 per cent milk, and 4 cents per point allowed for other tests; all milk made into cream that is sold in fluid form, 22.5 cents per pound fat above the average monthly price of 92-score butter on the Boston market; all milk made into butter, at a price per pound fat equal to the month's average on 92-score butter in Boston.

Iowa Butterfat

The Iowa Creamery Secretaries' and Managers' Association reports that for the creameries reporting patrons received 48.64 cents a pound for fat in May as compared with 45.59 cents in May of last year. For the previous months of the current year the prices paid for fat were as follows: January, 55.50 cents; February, 58.12 cents; March, 56.47 cents; and April, 54.59 cents. Prices paid for fat in May ranged from 42.1 to 53 cents, with an average of 42,837 lbs. fat handled per creamery reporting.

HERCULES BULL TIE

Patented June 17, 1924

For positive control of most vicious bulls; safe leading; firm tying, stable or pasture; ideal show halter. Best breeders say worth twice the price. Hercules Bull Staff, the staff without a spring. Has a safety lock, operates in a jiffy. Moyer Brand show halters for Dairy and Beef stock. Leather stable halters, neck straps, rope halters for cattle. Moyer Horse halter with new style hardware. Show bridles white or colored. Write for circular and price list. Moyer products are for sale by all leading Stockmen's Supply Houses and Dealers.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

News Writing for Juniors

Does your club have a newspaper reporter? Many 4-H clubs do, and every club ought to. Club work in your community can be boosted through the newspapers.

Your home town newspaper is interested in club work and especially in your club and its activities. The newspaper will be glad to co-operate with you, if you give it the right opportunity. Many papers devote much space to club work.

Get acquainted with the editor. He is human. Invite him to a club meeting or to your banquet, tour, round-up, or picnic. Even though he may not be able to accept all your invitations, he will appreciate receiving them. The instance has been known when a newspaper editor has served as a club leader.

Suppose it's your job to write for the newspaper. How will you go about it? You should know that every newspaper has a dead line—or a definite time after which no copy is accepted for publication in the next issue.

We have in mind a weekly newspaper that is dated Friday of every week. It is published Thursday and mailed Thursday night so as to be in the subscriber's hands Friday morning. The dead line is Wednesday night. The essential thing to remember is to get your copy in early in the week; the earlier the better.

The word "copy" as used in the newspaper world means something that is written for publication. Now how should copy be prepared? There are some mechanical details to be considered.

Copy should be legible—easy to read, written on one side of the paper only, with plenty of space between the lines—for the editor's convenience in editing—and room at the top of the first page, say two or three inches, for the editor to write the headlines. Copy written with the typewriter is preferable but either pen or pencil may be used. The pages should be numbered.

Be careful in the spelling of all proper names. In some newspaper offices the instructions are "Follow the copy even though it goes out of the window." In other words, if you have misspelled a name it is likely to be misspelled in print.

Write your figures plainly. When should numbers be written out and when should figures be used? Numbers under ten are usually written out, and figures used for numbers over ten. It isn't considered good form to begin a sentence with figures, the number should be written out unless it is preceded by some word or phrase such as "about," "more than," "approximately," "exactly," or "almost."

Examples of the use of numbers are as follows: Good—"Fifteen club members were present, etc.;" Poor—"15 club members, etc.;" Good—"There were six cows in the ring." Poor—"There were 6 cows in the ring."

What is news? The chief duty of the club newspaper reporter is to write reports of club meetings. There are other forms of club news which a club reporter can handle. Some of these are: achievements of club members, prizes won, unusual records made, trips taken by club members. Good project stories written by club members themselves, these may well be prize winners, are often acceptable for publication in the local paper. These may be classified as human interest stories.

How should a meeting report be written for the newspaper? The first paragraph of a news story is called the "lead." In the lead try to answer as many as possible of the questions "what, where, when, who, why, how?" Put the outstanding part of the meeting into the lead. If a new president was elected your lead might be like this "John Brounty was elected president of the Black-Jo-Ro-No Club at the meeting held last Saturday afternoon, June 16, at the home of Harold Brown." That statement answers the questions, who, where, when, what.

In the following paragraphs of your story tell about the program and give, if possible, the date and place of the next meeting. Give the names of those who took part in the program and tell a little about what they did or said. Be concise in writing your report. Don't repeat or use too many words to tell the story, but supply enough details to make your report interesting. We all like to read about what the other fellow is doing.

Why not keep a scrap book of newspaper clippings about your club and its members? A paper covered notebook will do for this purpose.

Mark the date under each clipping and the paper in which it appeared. A scrap book makes a fine record of club activities and is often a handy and valuable reference.

Carl Bjork—Going Up

When Carl Bjork was chosen as a member of the Connecticut Agricultural College Poultry Judging Team to take part in a national contest at Madison Square Garden, few people knew what a crowning achievement it was. Several years ago as a freshman in high school, Carl joined the Stratford Better Poultry Club, a 4-H group having for its aim the improvement of backyard flocks around the town. Until an unusual interest in poultry developed Carl had never known just what he was going to do but during his last two years in high school he determined to go to the Connecticut Agricultural College at Storrs and train for poultry work, specializing in diseases. His choice as a member of the state college judging team comes then as a pleasing but not unexpected development to those who knew his story.

The improvement of his backyard flock of Barred Rocks, enlarging and modernizing his poultry house, creditable performance in judging contests, exhibitions, and egg laying competitions had all marked Carl as a consistent if not phenomenal club member and with his turning over the hens to his younger brother and starting off to college a new chapter began. We are confident the story is not finished.

A. J. BRUNDAGE, State Club Leader.

The best speaker at a recent meeting was a deaf man. The best farmer in Illinois a few years ago was a one-armed man. It is great to have steam up to rise above your handicap.

A 4-H College Club

Hoard's Dairyman Juniors may be interested in the plans that are being discussed for the organization of a national 4-H club fraternity. Such a fraternity has already been formed under the name of Mu Beta Beta at the Washington College of Agriculture and at the University of Idaho, with Kenneth Hinshaw, winner of last year's Moses trophy, as acting president.

The club was organized on May 31, 1924, and Robert Polson who was

This was the original committee on the organization of the 4-H college club known as Mu Beta Beta. Left to right they are: Robert Polson, Anna Trudeson, Wesley Calkins, Leota Tucker, and Milo Davis.

then a student at Pullman, was elected president. Polson graduated from the Wisconsin College of Agriculture this June and expects to make boys' and girls' club work his life job.

Polson says, "The fraternity has been organized for the purpose of keeping together all those college students who intend to go on with club activities. Members will be selected because of superior records made in club work. Leadership is what we want to train for, so that young men and young women will go back into their communities and foster club work when they are graduated from college. Thus a reserve of local leaders will always be maintained."

Polson's home is at Montesano, Washington, and he was one of the outstanding club members in his state. In his project work he was so successful that he saved enough money in three years to put himself through two years of college. He was the first president of the state 4-H club and did much in perfecting the type of community club meetings that are now held in Washington. He superintended the boys' and girls' club work at the Grays Harbor County Fair at Elma for four years. In the six years that he was an active 4-H club member on the farm, he started 15 people out with pure-bred hogs.

Wisconsin. GUY A. PETERSON.

Exhibiting Vegetables

HOARD'S DAIRYMAN JUNIORS:—What kind of vegetables shall be selected for exhibition purposes? How shall those vegetables be prepared so that they will look well when on display? Those are the questions that are uppermost in the minds of good 4-H garden club members at this season of the year.

The largest vegetables are not always the most desirable for exhibition purposes. Large vegetable often coarse and woody and a desirable for table use. It i missible to consider size and when stock vegetables are bei lected. Table vegetables shou medium sized, regular in shap uniform in color. In fact, any table that would be ideal fro housewife's point of view wou the ideal vegetable for exhi purposes.

If the fair premium books c two specimens of a single entr to get them as near uniform in shape, and size as it is possible Select all vegetables immediatel ceding the day of the fair. V bles on display should be attra and fresh vegetables are more a tive than those which have be lected several days prior to th No vegetables should be dis that are diseased, injured by i or are blemished in any way. display is no credit to the indi exhibitor or to the club.

Onions should be small, w pened, neck firm especially a base, and clean, but not p Pie pumpkins should be m sized, thin skinned, closely r and should have a deep color un ly distributed over the pur Field pumpkins may be select the basis of size and shape. about two or three inches of st pumpkins. Muskmelons shou firm, closely netted, and ribbed. When fit for display melons pull easily from the ste flower end is somewhat sof yielding to the finger. The clo of the netting shows quality. should be displayed with the trimmed short or to pyramid The heart should be large and well up. The heads should be stems long, well-blanched, fir, medium thickness, free from ru rot, and should show no flower Ribs should not be prominent

Cucumber specimens shou smooth and carry out well towa ends. Tomatoes should be m sized, well-rounded, smooth, ev ored, and firm, blossom end Rhubarb stalks should be straight, medium sized, tender, well distributed. String bean should be long, straight, mode broad, brittle, and free from d Seeds should be well develope tender. Cauliflower should h large head, with a dense format flower, showing no tendency to heads should be pure white in and should show no small leav a few of the leaves should be l

Cabbages should be displaye two layers of outer green Heads should be uniform in si shape, not excessive in size, bu Cut off the root stock even wi bottom of the head. In pre such vegetables as beets, turnip carrots for display purposes, c tops off about an inch abov crown. Wash the vegetable if sary. Care should be exercise to rub off the skin of the veg See that all side roots are re

Arrange displays so they w attractive. Even quality produc per at a disadvantage when dis on dirty receptacles.

A Texas Farm

's Dairyman Farm:—We farm 40 black land on which we plant cotton, orghum, and millet. This year we bales of cotton from about 27 acres About three acres were ruined by worms, and other bugs.

ave eight Holstein cows, two calves, bull. My dog's name is Scout. I dog trained to lead my horse and to ll with me. He goes in swimming and when I go in deep water he is afraid that I will drown if he isn't near me.

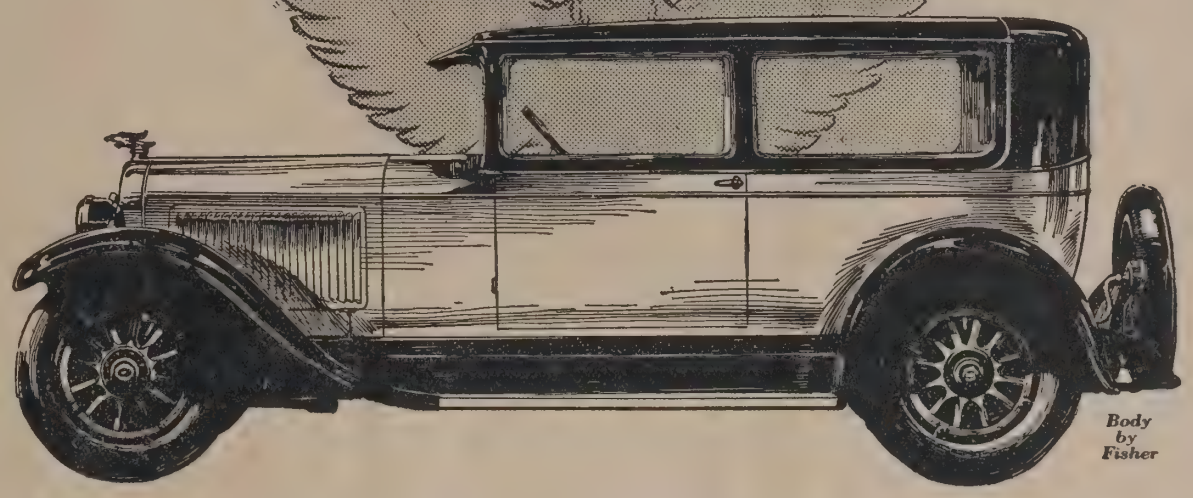
My horse is named Pinto. She will come to me whenever I call her. I can make her say yes and no. If I tell her to stand on her hind legs, she will do so. My address is Needville, Texas. Melvin W. Nowotny.

A Poem "Sunrise"

Hoard's Dairyman Juniors:—I have long been wanting to write to your page which I enjoy very much. I received my creed and button some years ago. I am sixteen years of age and live on a small farm and wouldn't exchange places with a city girl for anything. I wish you would all write to me. I like poetry. Here's some of mine:

The sun is rising at break of day,
Up from the horizon it's making its way.
A purified, golden sphere of light
Proceeding up into paradise.
The heavens are painted, a wonderful sight,
While the glimmer of morning tints through the night
Of crimson and crystal and dashes of gold,
Mother Nature's the maker of beauty 'tis told.
Above all this splendor is the deepening blue
Getting darker and deeper and of every hue;
Is dotted with beautiful white cotton clouds,
Tinged with light blush, like some angel shrouds.
The sun in its glory comes over and shines
Half covered by gloomy dark green sombre pines
Which are bended by heft of little white flakes,
As the wind whistles through the branches it shakes.
The foreground is crested with new fallen snow
Like glittering diamonds all in the sun's glow.

My address is R. 3, Box 76, Greenwood, Wisconsin. Isabelle Palman.



Likes Junior Page Best

Hoard's Dairyman Juniors:—I milk three cows every night now. I have a heifer calf of my own. It is a pure-bred. I also belong to the 4-H club. My father received Hoard's Dairyman tonight, and I read the paper as soon as I came home from school. I like to read the junior page best. We drive the pony to school every day now. My calf is almost all white with a few black spots. I feed it milk, hay, silage, grain, and some mineral feed. My address is Poplar, Wisconsin. Marjorie Anderson.

Announcing The

OAKLAND ALL-AMERICAN SIX

At New Low Prices!

Body by Fisher

Built to meet every American demand for Reliability, Style and Performance

All-American—that's the word! No other word describes it!

★ ★ ★

American design. American lines. American endurance for the roughest American roads—proved on General Motors' great American proving ground and built by American workmen using American precision-production methods!

★ ★ ★

A bigger, better, brilliantly beautiful car. New bodies by Fisher—new chassis—new engine. New standards of performance, endurance, and value—and . . . *NEW LOW PRICES.*

★ ★ ★

Low, graceful, fashionable lines emphasized by sweeping full-crown fenders. Arresting new Duco colors. Rich new upholsteries.

★ ★ ★

***In the chassis*—new factors of reliability and endurance—factors that people have long hoped to get—but never in a car of Oakland's price.**

★ ★ ★

A longer, deeper, heavier frame, more rigidly braced. A new and softer clutch. A new and smoother transmission. New elements of steering ease. 4-wheel brakes for safety. Smaller wheels (19″), larger tires (29 x 5.50), a longer wheelbase (117″), and an exceptionally low center of gravity for better roadability. And a new engine of 212 cubic inches displacement—the largest used in a car of Oakland's price.

2-DOOR SEDAN

$1045

Landau Coupe $1045 | 4-Door Sedan $1145
Sport Roadster $1075 | Cabriolet $1145
Landau Sedan $1265

The New and Finer Pontiac Six, $775 to $975. Pontiac Six De Luxe Delivery, $585 to $770. All prices at factory. Delivered prices include minimum handling charges. Easy to pay on the liberal General Motors Time Payment Plan.

★ ★ ★

A 78½-lb. crankshaft, counterbalanced and incorporating the Harmonic Balancer—a crankcase of bridge truss construction—Oakland's famous rubber silencing principle—and a new combustion chamber design from General Motors' Research Laboratories.

★ ★ ★

Value? None like it in all America today!

★ ★ ★

See this latest triumph of America's automotive supremacy—the new Oakland All-American Six!

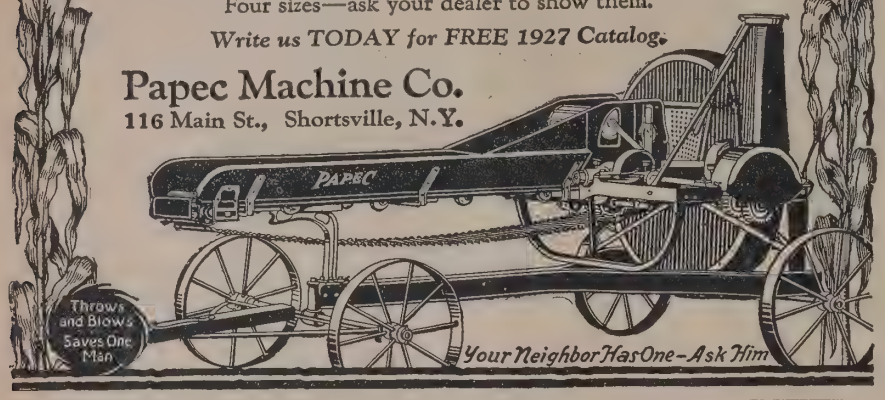
PAPEC "The Cutter That Does Not Clog"



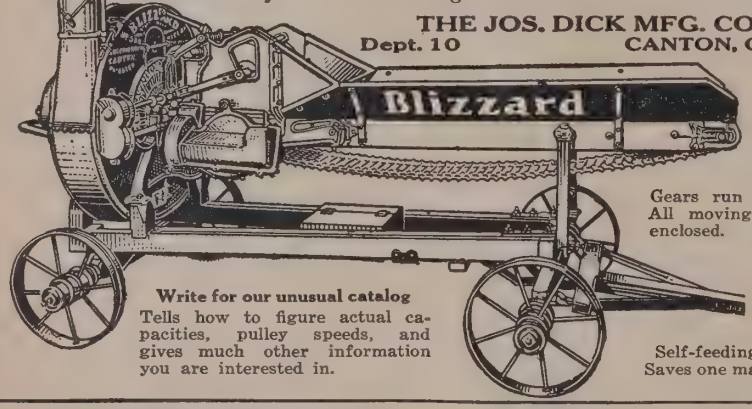
"Quality and Quantity of Cutting"

are the Papec features that most appeal to J. Smith Brundage, Superintendent of the Steuben County (N.Y.) Farms. The Papec cuts ensilage fine and even, so that it will pack firmly. It "eats up corn" as fast as a man can throw it from the wagon. Needs no man at the feeding table, thanks to the Third Roll. Fills the highest silo without stress or strain. Operates at low cost.

Four sizes—ask your dealer to show them.

Write us TODAY for FREE 1927 Catalog.

Papec Machine Co.
116 Main St., Shortsville, N.Y.



A University Test that made a University Sale

You have read much regarding University tests of different makes of Ensilage Cutters. In 1925 the University of Wisconsin made an official test of a No. 500 BLIZZARD Machine. A complete copy of that test will be furnished on request.

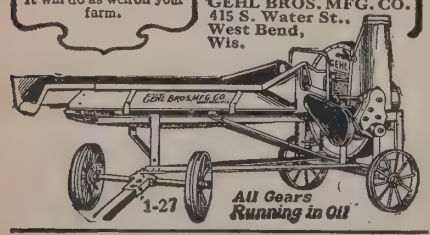
This No. 500 BLIZZARD Machine was afterwards purchased by the University of Wisconsin for its own use. The University has used several BLIZZARD Machines for a number of years on its farms. Could you ask for a stronger endorsement than that?

THE JOS. DICK MFG. CO.
Dept. 10 CANTON, OHIO

Gears run in oil. All moving parts enclosed.

Write for our unusual catalog
Tells how to figure actual capacities, pulley speeds, and gives much other information you are interested in.

Self-feeding. Saves one man.



GEHL Lightest-Running SILO FILLER

Low speed means less power required, less vibration, hence longer life. The Gehl has all steel construction, non-breakable, boiler-plate fly wheel. Absolutely self-feeding. All gears enclosed—run in oil.

What a University Test Proved
A Gehl cut 19.26 tons per hour with only 13.26 H.P., elevating 35 feet and running 465 R.P.M. —the lowest power of any cutter in the test. It will do as well on your farm.

Auto Type Gear Shift for changing length of cut. Wonderful no-choke blower fills highest silos with low speed—3 H.P. and up will run Gehl cutters. **Dealers everywhere** — Write for name of nearest dealer.

The PERFECT CORN HARVESTER

Sold Direct $21.75 JUST the THING for SHOCK or SILO CUTTING

Works in any kind of soil. Cuts stalks, does'nt pull them. **ABSOLUTELY NO DANGER.** Cuts 4 to 7 acres a day with one man and horse. Great labor saver. Sold direct to farmers. Get your catalog NOW—Be prepared. Write:

LOVE MANUFACTURING CO., Dept. 128, Lincoln, Ill.

Rowell Builds Them Right!

We have been making high-quality farm equipment since 1870 and were among the first to make an ensilage cutter.

All this specialized experience goes into the building of Rowell Trojan Ensilage Cutters. It is because of this experience that we developed a guaranteed-for-life flywheel for the Trojan—a flywheel *that will never break.*

Rowell Trojan cutters are built right, in every detail from the twist-proof main frame to the end-thrust bearings that take up wear; from the automatic feeder to the non-clog blower. Big capacity and light running. A 10 H. P. engine, or equal power, runs it.

Write for catalog and free copy of valuable Government Silage Bulletins Index.

Seasonable Live Stock Notes

During the last half of August we begin to look for roasting ears in the field corn, not that they may be boiled and served with butter and salt but that we may speculate on the prospects for a matured crop. It is a time when we either are happy over the certain prospects for a bumper crop or are somewhat hopeful that future weather will make up for the delinquencies of an unfavorable season. It is a time when we already know about how much small grain and hay are to be available for feeding until another season's production is at the harvest. It is a time when we hope to relax between the finish of threshing and the advent of filling silos. All of this anxiety about the outcome of the crop harvest has its objective in the husbandry of live stock. What can we do for farm animals at this time.

Rest for Hard Working Cows

In the strictly dairy sections and somewhat in other sections where dairy cows are kept, a large number of cows are nearing the close of their lactation periods. At this time we urge the serious consideration of adequate rest periods for such cows, particularly those that have sacrificed considerable of their body weight to the production of milk because of the impulse of inheritance or of the necessity on account of insufficient feed or both. If we succeed in breeding cows for higher milk production, then by all that is fair we ought to give them a decent opportunity to live up to the impulse of that superior breeding. If we build up in one place we ought not to tear down in another and that is just what we do when we neglect or refuse to give good cows at least six weeks of rest between lactations. During this period feeding is just as important as it is when cows are at their best in production.

Sprouted Oats for Shy Breeders

Spring calves, heifers of a year ago, are nearing the time when they are to be bred for their first experience in motherhood. Frequently owners of such heifers have some difficulty in getting all of them safely settled in calf. When this occurs there is great disappointment, particularly if the failure by chance strikes the best heifer in the herd. Why such heifers fail to conceive is not usually known by the owner and, what is more, expert veterinarian examination frequently fails to ascribe a cause. Some interesting experiments have been conducted at the U. S. Bureau of Dairy Industry farm at Beltsville, Maryland, in which sprouted oats fed to such heifers and cows apparently improved conception. Our issue of April 24, page 452, gave a report of this experiment. We are calling attention to it because further trials are necessary to more definitely establish the effects of the treatment. It may be that a number of dairymen could and would try it out in an experimental way.

Time to Select Breeding Gilts

The observing swine producer already has his eye on a number of gilts that strike his fancy for breeding type. It is time to consider such factors as may govern the feeding management of gilts to be used for breeding purposes. Spring pigs are far enough developed as to indicate individual type. Should gilts that are to be used as breeders be left with the animals to be finished for market or should they be separated and fed differently? If the market herd is to be pushed rapidly to market weight on fattening feeds and scant pasture, it is advisable to select and separate gilts for breeders and feed them on rations that tend to proc growth, scale, and good quality bone. There is no objection to feeding such gilts provided they of the type that gives promise of veloping into large, smooth, ro

ESTABLISHED REX 1896

New – Scientific Animal Spray

Here is quick relief for animals against flies, mosquitoes, fleas and lice.

The newest scientific development in the famous line of Rex insecticides and agricultural sprays is STOCKAID.

Rex STOCKAID is a double purpose spray. It kills every fly, mosquito or flea it touches, and also repels insects for 6 to 12 hours after animals are sprayed. Rex STOCKAID has many other advantages, too —stainless, pleasant odor, will not burn, blister, irritate or harm the hide. Does not gum the hair — leaves the coat fine, nice and glossy.

Rex STOCKAID will not taint milk.

Like all Rex products, STOCKAID is backed by a money-back guarantee to kill and repel those biting, buzzing, irritating insects which reduce milk production and retard normal animal growth.

Those who have used FLY-TOX, NUREXO, AFI-TOX and other REX insecticides and fungicides will need no other incentive to give STOCKAID a trial. Your retailer sells this wonderful spray.

RUNNING WATER WITHOUT WORK

With a good Well and a good Windmill you can have all the water you want without work, worry or expense. Water from a well costs you nothing. The cost of an **Auto-Oiled Aermotor** is moderate. The expense for maintenance is so small that it need never be given a thought.

An Aermotor runs in the lightest breeze. It will also work safely and steadily in the heavy winds.

The **Auto-Oiled Aermotor** is completely self-oiling. The double gears run in oil in a tightly enclosed gear case which holds a year's supply of oil. When the mill is running the oil circulates through every bearing. Every moving part is constantly and completely oiled. Friction and wear are practically eliminated.

Auto-Oiled Aermotors have behind them a long record of successful operation. Their merits are known the world over. For further information write

Increase Your Dairy Profits Use BOVINOL

REG U S PAT OFF

You can increase milk production at least 10% by the consistent use of Bovinol! Agricultural experiments and practical dairy tests have proved it.

Cows waste energy fighting flies. Wasted energy means less milk. Scientists estimate that the energy used by an animal in fighting flies is equal to the food value of a pound of oats per head per day.

It will pay you to use Bovinol to protect your cows from flies. Flies may light on a cow sprayed with Bovinol but they cannot bite. They are smothered by the oil if they try it.

Care must be taken in applying Bovinol to cover every square inch of the hide. It can be done in less than a minute with the compressed air type of sprayer in which the oil is forced out by air pressure and is further atomized by an air blast. Spray against the direction of the hair so that the Bovinol will penetrate the coat.

Bovinol is a colorless, stainless and tasteless oil. It will not contaminate the milk, for it has no odor. It is non-poisonous —will not injure or irritate the hide. Spray your cows twice a day with Bovinol if you would increase your dairy profits.

Does It Pay Dividends?

HOARD'S DAIRYMAN:—I have had a number of men who were not C. T. A. members say, "If I thought I could only afford it, I would like to join a cow testing association."

Here is proof right in our own county. W. D. O'Brien joined the Jackson County, No. 3, Missouri, Association in January. He had at the time he joined the association 14 cows averaging 13.5 lbs. fat, making him a total profit of $55.19 above feed cost. He sold eight of these cows to market as unprofitable. In May he had 9 cows averaging 37.7 lbs. fat per month, making him a total profit of $178.87 per month. In other words, Mr. O'Brien is milking 6 cows less than he did in January; his cows are averaging 24.2 lbs. more fat and are making a net return of $123.68 more than in January. He received 3092% returns on his investment of $4 for one month test.

Another example is Sherrill Farm Company. They have a very fine herd of pure-bred Jersey cattle of finest quality. In March their 17 cows averaged 16.7 lbs. fat, with a total loss of $24.29 below feed cost. In the month of May these same 17 cows averaged 25.8 lbs. fat, or a total profit of $124.51. In three months these cows showed an average increase of 9.1 lbs. fat, and a total profit above March of $147.80. This man received as returns for the $4 he paid for the month of May for testing, a net return of 3695% on his investment.

Neither one of these men feed any commercial mixed feed or ha put in an overamount of tim their cows. These returns are proper feeding, weeding, and ing. I think this will prove r ter how small or how large you you are doing yourself, you

For healthier, happier bulls! For safer, surer breeding!

A Bull Survey

Y'S DAIRYMAN:—Out of the
-bred bulls in the Reno—Har-
ociation of Kansas, seven are
ed to run with the dairy herd,
ce which is not advisable for
herd and is very dangerous;
n had paddocks in which they
rmitted to exercise; and five
re kept in box stalls, a very
licy. Bulls without plenty of
soon become slow, inactive,
ile. Two bulls in the associa-
ame sterile during the year
very reason. One was turned
a large paddock and again
a breeder; the other never
was sent to the block.

owners carry water to their
ne owners have water piped
ull pen, and seven are still
their bulls to water, usually
nd of a rope. When we see
ber of men who take unnec-
hances twice every day we
surprised at the number of
n who are attacked by bulls.
two members have "Safety
ns." By this we mean pens
er have to be entered except
ning. These pens are built to
rd use, with a paddock large
for exercise, shelter enough
the wind and shed water, wa-
l to the pen, a good manger
rack, and a breeding chute
ged that the pen needs never
ered and bull never needs to
out of the pen. With such
cross bull does not need to
d, and caring for the bull is
le trouble and you do not
take your life in your hands
ne you take care of them.
irymen consider the bull as a
nuisance on a dairy farm.

Bulls.

C. H. HOSTETLER, Tester.

ontinue to Test

3 DAIRYMAN:—Many C. T.
ers at the end of their test-
cannot see why it would pay
test year after year. Does
s testing convince you that
given your herd a fair
Perhaps you have not grown
crops or have not been feed-
ced rations or you have not
inferior cow.

ast year a member of the
nt Association of Michigan
ns to believe that continued
es pay. A year ago he was
etween 20 and 24 cows and
feed or the time to give them the right care. I suggested selling about half of them and believed he would feel well repaid. The result was an auction sale, but he kept about eight of the best. At present he has 10 and tells me he is getting nearly as much in a month for his milk, is saving half the feed and labor, and is doubling his profit.

Last year in the association he finished with an average of 275 lbs. fat. This year he has set his mark at a 350-lb. average and at present is one of the leaders in the association and going strong.

FORREST BENDER, Tester.

Uncle Ab says that work is the best cure for the blues.

LIVE STOCK FOR SALE

Twenty high grade Holstein cows bred to freshen this fall and early winter. This herd made an average of 9,713 pounds of milk and 346 pounds of fat per cow in 1926, and has made an average of over 200 lbs. of fat the first six months of 1927. Records are from the St. Louis County Cow Testing Ass'n. They are T. B. tested, have excellent udders, and young. Reason for selling, barn burned on July 2 and can not give them proper care. This herd is priced at $2500, dirt cheap considering the quality. KREIDLER BROS., Route 3, Duluth, Minn.

Transmitting Bull. Don't gamble on a herd sire. Get a proven one. My "Count-Piebe" bull has first calf, grade heifers giving 9800 lbs. of milk a year. Will sell or trade for cows. J. A. THOMPSON, Brookville, Ind. 14-2

For Sale—Treadmill for bull, used six months, $50. Covered milk wagon, $75. Grade and pure-bred registered Holstein cows, $100 and up. Prices f. o. b. Butte. THE MINERS' DAIRY, Butte, Mont. 14-2

Twenty high grade Holstein milkers and springers; also a few high grade Holstein heifer calves. $20.00 per f. o. b. Waupaca. JOHN PETERSON, Waupaca, Wisconsin.

Can supply you with carload choice springing or fresh grade Holstein cows. Several with C. T. A. records up to 500 lbs. fat. W. L. BAIRD, Waukesha, Wisconsin. 2-*

Holstein Bull. Three of his dams averaged 108 lbs. milk 1 day, 40.48 lbs. butter 7 days, $125. ROY HARRIMAN, Appleton, Wisconsin. 26-*

Three handsome Holstein heifer calves, $65.00 tested, crated. ALFAKORN DAIRY, Evansville, Wisconsin. 14-5

If you want real choice Holsteins, any age or number, write H. E. ANDERSON, Whitewater, Wis. 2-24

Growing Gilts for Breeding Purposes

It is now time to give some extra consideration to the gilts from the spring farrow that are to be used for breeding purposes. Breeding stock should be well grown and strong in every respect if they are to perform the functions of motherhood in a highly efficient and desirable manner.

Their selection at this time should be made with great care. The herd has developed enough now that one may choose the animals that nearest approach the desired type, eliminating those that are undersized, poorly developed, and offtype. The larger, more stretchy, more growthy gilts that are well balanced in proportion, strong in the back with straight, well set, strong legs and good pasterns and feet are the desirable kind.

One should examine the teat development of gilts both as to number of teats and as to whether all of them are free and correctly formed. Swine husbandmen have recently discovered that many of the teats of gilts are tied up closely to the abdominal wall by a hard central cord and that these teats do not develop into good milk producers. Gilts with many teats like this should not be saved for breeders.

Gilts for breeding purposes should be well grown but not allowed to become too fat as would be the case where they are left in the general herd eating from self-feeders or being hand full-fed. If the general herd is being carried along on somewhat restricted grain rations on pasture, such as would give good growth without producing too much fat, the gilts could well remain in the general herd for another month or six weeks. If, on the other hand, the general herd is being fed from self-feeders or is being full fed by hand, the gilts should now be separated from the general herd and placed on rations that will continue their growth without making them excessively fat. For good growth the gilts should have more protein in their rations than is necessary or advisable in the rations of the pigs being pushed rapidly to an early marketable weight.

It is thought that the feeds more bulky in character and of less extreme carbonaceous content are more desirable for developing gilts. Good pastures are highly desirable partly because an element of exercise is induced because of their use. Skimmilk or buttermilk properly pasteurized or from a clean herd of cows is prized very highly by men successful in developing gilts. The grain mixtures may be simple. If plenty of skimmilk is available a grain mixture composed of half shelled corn, or ground barley, or of any of the grain sorghums ground, and oats or standard middlings is satisfactory. Where the pastures are not very good, and no skimmilk available, a grain mixture composed of 40 parts corn, or ground barley, or grain sorghum, 30 parts ground oats, 20 parts middlings, 5 parts linseed meal, and 5 parts tankage is very good. The quantity of any ration to feed daily should be according to the growth and condition of the gilts fed. To keep them growing without getting too fat is the ideal to strive for. Attempts have been made to use the self-feeder in developing breeding stock with varying success. The method is not generally successful because it is difficult to mix feeds of the right kinds, proportion, and consistency to prevent the gilts becoming too fat. Hand feeding according to condition is best.

One should provide a mineral mixture including salt. A mixture composed of 20 parts common flake salt, 40 parts finely ground limestone, and 40 parts steamed bone meal is good. Later after the gilts are pregnant it is advisable to add potassium iodide especially in sections where the lack of iodine causes hairless pigs.

Alfalfa Hay Versus Alfalfa Meal

In an Ohio pig feeding experiment bright green alfalfa hay fed in a rack proved fully equal to alfalfa meal in rate and economy of gain. One lot of 40.5-lb. pigs was fed corn, tankage, salt, limestone, linseed meal, and alfalfa meal. The pigs gained 1.21 lbs. daily, consumed 385.7 lbs. feed per hundred pounds gain, at a cost of $5.87. The pigs consumed 13.6 lbs. alfalfa meal for each 100 lbs. gain. Another lot of pigs had the same feeds except that alfalfa hay fed in racks was substituted for the alfalfa meal. These pigs gained 1.32 lbs. daily, consumed 396.2 lbs. feed for each 100 lbs. gain at a cost of $5.88 per hundred pounds. The pigs consumed 27.4 lbs. of alfalfa hay for each hundred pounds gain.

The difference in the quantity of alfalfa consumed made only 1.8 lbs. difference in the amount of tankage and linseed meal consumed.

Bone Meal Versus Acid Phosphate

Swine rations composed of grains and high protein supplements from plant sources are made more efficient by adding certain minerals. Corn and soy bean oil meal or soy beans is such a ration.

The Ohio Station found that the addition of salt and ground limestone brought about some improvement. A mixture of salt, limestone, and sixteen per cent acid phosphate brought about greater improvement but not as much as one of salt, limestone, and bone meal. A mixture of salt 1 part, ground limestone 2 parts, and bone meal 2 parts gave excellent results.

Ground rock phosphate, frequently recommended and used in mineral mixture for hogs, proved detrimental rather than helpful.

A man who hides behind a woman's skirts today is no coward—he is a contortionist.

The Right Salt saves feed

and reflects its worth in the market value of the animal

PROPER feeding—and this involves the salt which is fed to livestock—has an important bearing upon profits when it comes to marketing.

A noted agricultural authority who has experimented with hogs, finds that a pound of the right salt means a saving of from 20 to 200 pounds in feed.

Aside from the economy, salt is a vital part of a well-balanced ration for any farm animal, essential alike to increase efficiency and market value.

Use Diamond Crystal Salt for all stock feeding. It is pure and mild, with no bitter, salty taste which so often drives the animals from the salt pile before they get enough.

There is a Diamond Crystal Salt for every farm use—for table and for cooking, for livestock, for canning, for butter and cheese-making, for curing meats. Ask for Diamond Crystal at the store where you trade.

Stiff Pole Hitch can be furnished instead of Quick-Turn Tongue Truck.

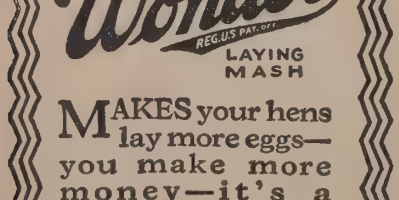
Cuts Your Corn Faster; with Less Work; at Lower Cost

The John Deere Corn Binder not only speeds up the corn cutting job but it also is a real cost-reducer. Five to seven acres of corn cut and bound ready for the silo or for the shock is an ordinary day's work with the John Deere.

Remember that it also relieves you of a tedious tiresome job—the job of hand cutting.

At silo filling time it saves men; does away with cutting in advance; permits getting the corn into the silo in prime condition.

The clean work of the John Deere is important to you. The stalks are delivered to the binding attachment with minimum loss of ears, where they are formed into easily handled bundles. The power carrier, tripped by the foot, delivers bundles and loose fodder beyond the path of the team, eliminating the danger of breaking the bands and scattering the stalks by the horses.



Among the many other features you are sure to like is the tongue truck—it's a real horse-saver. Ease of handling, great strength, ample traction, light draft plus good work—all of these features, so valuable to you, are combined in the John Deere.

See this binder at your John Deere dealer's.

FREE BOOKLET that tells all about this better corn binder, free for the asking. Write John Deere, Moline, Ill., for Booklet TB-514.

Poultry on the Dairy Farm

Parasites and Others

So much has been said about intestinal parasites this spring that we are apt to forget about the external variety, a crop of which one can harvest during hot weather.

There was once a man that kept a few lice on his birds, mites in the house, and fleas on his hound hog, because he claimed it kept them active and ambitious. That is false philosophy, for any action requires power and power is generated by feed. Feed should be used only for productive purposes.

There is a distinct difference in the appearance, habitat, and treatment for lice and mites. This point is often forgotten by flock owners. They expect one treatment to control both classes.

Lice limit their activity to the body of the bird. The eggs are deposited on the feathers, particularly around the abdominal section, and are found as clusters of grayish dust-like material attached to the quill. The most common louse is the rather long bodied, whitish, spotted variety that in color resembles a Holstein and in sufficient numbers makes one think of a herd.

Since time began people have been recommending louse treatments. These controls have run the line from powders, liquids, gases, vapors, and bottles to banana stalks and pills. Out of this motley collection one can select sodium fluoride for year round use as one method to follow.

For summer uses the powder may be used to best advantage as a dip. On a hot day the powder may be mixed with water at the rate of one ounce to each gallon. A large tub is advised and a pound of sodium fluoride to 16 gallons of water is sufficient to treat from 150 to 200 hens.

The entire flock should be treated at one time. Any stray individuals will be a source of supply and may reinfest the entire flock. Each hen must be thoroughly saturated with the solution down to the base of the feathers.

Grasp the fowl by the legs and the wings. Immerse her into the solution tail first and, when in the water, release the hold on the wings and work the solution into each section thoroughly. Before releasing, duck the head under water. Run your hand over the body to remove excess water and turn her loose. A hot day is required to prevent the flock becoming chilled and contracting colds.

For winter and colder weather use, the powder may be mixed with unsalted lard or vaseline at the rate of 50—50 and applied to the surface below the vent.

In some instances the powder is applied as a dust, but this method is harder on the operator than the lice on the birds. It tends to irritate the membrane of your eyes, ears, nose, and throat and is, on that account, objectionable.

The time of treating or retreating is dependent upon the weather and necessity. During extremely hot weather the lice become more numerous and treatment is demanded. A heavy parasite infestation results in a lowered production and a lowered profit. A dusting place do assure complete success. Some means is demanded.

Mites

Mites are found around the and nests or other roosting It is impossible to treat the and control mites. In fact it is ly possible to find mites on They go on her body while ro or nesting but go back into the and crevices of the wood to liv and reproduce. One can identify mites by the grayish powder that is found on the s of the wood when they are pre

Some good penetrating woo servative is the best treatment. best because only one applicat demanded each year. Other n als such as kerosene and waste case oil will give temporary but the material must be a too often. A wood preservati soak down into the wood, prev the eggs from hatching, remain longer period, and permit few plications.

When this material is applie a brush, undiluted, to the roos nests once yearly, these parasit be controlled. It is foolish some dilutant and expect to us a spray. The heavy base is re

For a spray in the colony on range, one can use some c product to best advantage.

Scaly leg mites are another site commonly found. These c roughened appearance to the of the older birds particularly. mite can be controlled by the cation of some oil or by dipp shank in kerosene and then t with a grease.

Summer Suggestions

Trees make the best possible ing place for young stock. Th sibility of theft is increased, b results otherwise are beneficial. means for young stock, not hens.

When the colony house is us roosting, a sufficient amount of must be given. This usually that the entire house should be over to roosts. Even the co tion of a building with a r with wire covered sides is oft visable. These structures wor ly for the larger pullets that housed earliest.

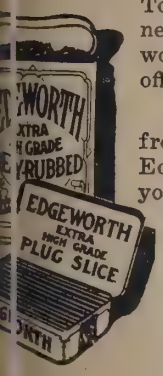
tuckian submits verse that expresses his feelings on pipe-satisfaction



smokers express their satisfac- in various ways. As a matter of not a day passes but what sev- interesting letters come to us Edgeworth Club members in and far corners of the world.

casionally some poetic-minded er breaks into verse. Sometimes easure and rhythm leave some- to be desired. Here, however, is of pipe-smoking sentiment pret- ell expressed, in our opinion:

"A Prescription"

Have you ever noticed
right after a meal
How tired and lazy
you always feel?
'm telling you folks
it isn't a joke,
t will freshen you up
if you try a good smoke.
But whatever you do
these lines you must heed,
There's a certain tobacco
of course, that you need.
t's packed in a tin,
the tin's colored blue.
Not only the smoking
but the chewing kind too.
f course if you never
are bothered this way,
ust keep the prescription
for some other day.
sk for tobacco,
the best that's on earth;
o shorten the story,
just call it "Edgeworth."

Chas. J. Butler
Owensboro, Ky.
Feb. 2, 1927.

To those who have never tried Edgeworth we make this offer:

Let us send you free samples of Edgeworth so that you may put it to the pipe test. If you like the samples, you'll like Edgeworth wherever and whenever you buy it, for it nev- nges in quality.

te your name and address to r & Brother Company, 15 S. 21st e, Richmond, Va.

ll be grateful for the name and d s of your tobacco dealer, too, if re to add them.

Edgeworth is sold in various sizes s the needs and means of all c sers. Both Edgeworth Plug e and Edgeworth Ready-Rubbed cked in small, pocket-size pack- s n handsome humidors holding a m and also in several handy in- w n sizes.

To Retail Tobacco Merchants: If obber cannot supply you with g orth, Larus & Brother Com- y will gladly send you prepaid by c post a one- or two-dozen carton a size of Edgeworth Plug Slice Edgeworth Ready-Rubbed for the n rice you would pay the jobber.

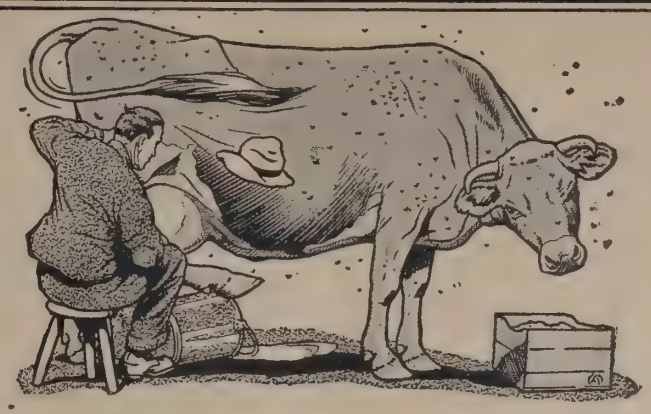
VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Georgia Abortion Work

We note with considerable interest that promising results have been had at the Georgia Experiment Station by the use of acriflavine as a remedy for the contagious abortion disease. The drug mentioned is chemically known as diamino-methyl-acridum chloride hydrochloride, which we do not ask our readers to remember. The cows used in the experiment had all aborted on one or more occasions and had all given positive reactions to the agglutination test in dilution ranging from 1 to 50 to 1 to 500 and higher. Three successive intravenous injections of the acriflavine in physiological saline solution, in dilutions of 1 to 500, 1 to 350, and 1 to 200, respectively, were given one week apart. The cows were divided into three groups of two each, and those in the first group received 100 cc., the second 150 cc., and the third 200 cc. of the solution at each injection. Three tests of the presence of the disease in the experimental cows were employed and are given as follows in the experiment station record: (1) the agglutination test of the blood sera of the cows; (2) the intraperitoneal injection of milk from the cows into guinea pigs; and (3) the calving records of the cows. It was found that within one year after the work was started the reaction of the blood from one of the cows gradually became less markedly positive, and in 14 months it was negative to the test. The blood from all other cows was gradually losing its power to agglutinate the organism.

The calving record is perhaps the most important of all from a practical standpoint. All cows receiving the two larger doses have bred and produced normal calves following a normal gestation period. Two of these cows had previously become non-breeders from the disease. The two cows in the group receiving 110 cc. of the solution were non-breeders and did not breed following the treatment. This would seem to indicate, according to the experts who made the tests, that large doses of the chemical are necessary. The use of acriflavine had no apparent effect on the cows except to reduce the flow of milk for a few days. Swellings were produced along the jugular groove, by injection of the drug, and persisted for some time. This swelling was probably due to a needle of too large caliber being used for the first injection, allowing a slight leakage at the point of puncture in the vein. These swellings appeared within a few hours after the injection of the acriflavine, and while they remained for some time they did not seem to cause any physical reaction of the animal.



Further reports on this subject will be awaited with interest. They are somewhat on a par with those made with neoarsphenamine at the Iowa Experiment Station for the retarding or cure of periodic or recurrent ophthalmia, commonly called "moon blindness," of the horse. In the use of that drug most troublesome swellings resulted when some of the solution happened to get into the muscles around the jugular vein instead of into the vein itself. So far, the treatment has given fair results. We hope the acriflavine treatment may prove as useful for abortion control.

Sweet Clover Poisoning

A local veterinarian told me that sweet clover would affect the blood of live stock so that it would not clot and that cows would bleed to death when dehorned. It didn't sound reasonable to me as I thought that you would have mentioned it in boosting for sweet clover for pasture. Have you any positive information on this point?

Ellendale, Minn. J. L.

As several times mentioned here, old, moldy, or otherwise damaged sweet clover hay is liable to prove poisonous and so affect the blood that it fails normally to coagulate. When cattle have been eating such hay for an extended period, dehorning or castration will be likely to be followed by fatal bleeding. Many instances of that sort have been reported. Fatal hemorrhage within the tissues may also occur although no operation has been performed. It is therefore dangerous to feed moldy sweet clover hay. The green plant is harmless as probably is sound hay; but it would seem best not to make any sweet clover hay the sole roughage ration when cattle are to be dehorned or castrated.

Dr. Hess Fly Chaser

makes cows milkable

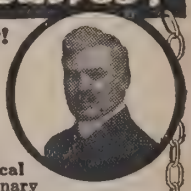
They relax. They let down. You get the last drop. It is long lasting.

Dr. Hess Fly Chaser has the odor of the pines. Because of this odor it serves a threefold purpose:

First—It is the most effective fly and mosquito repellent known to science—quick in action, long lasting.

Second—It is an excellent disinfectant. Therefore, while it is keeping the flies away, it is also destroying the disease germs that attack your cow's body—disinfecting your barns, and injecting into the atmosphere a most healthful odor.

Third—No herd sprayed with Dr. Hess Fly Chaser ever suffers from warbles, which cause a great annual loss to dairymen and farmers.



It does not blister—does not stain the hair—does not taint milk. Applied to the hands and face, it keeps the mosquitoes away.

If Dr. Hess Fly Chaser does not prevent the milk slump, make your cows milkable in fly-time, save your horse-flesh all summer long, it will not cost you one cent.

DR. HESS & CLARK, Inc., Ashland, Ohio

What Co-operation Must Be

(Continued from page 768)

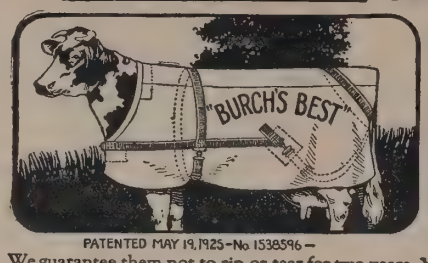
ing. But these generalities are the trend of co-operation and the guide-posts by which organizations may progress to success. They fit every situation, every commodity, every market. In the method of their following, each association will adapt itself to the situation. These conclusions are the message carried back to their organizations and their membership by those who attended the conferences. They were brewed from the mixture of the experience, knowledge, and opinion of all. They tell the co-operative world to expand in size, but to expand to co-operation with the handlers and consumers of the product; to expand with watching, understanding, and following the continual flow of change characteristic of the modern economic world, and to realize and act upon it; that not only is co-operation a business proposition, but that it is, like other business, successful only when directed by the best of business men.

Prizes at National Dairy Show

The prize list for cattle at the twenty-first annual National Dairy Exposition, often called the "court of last resort" for the dairy breeds, is now being distributed. The sum of $5,240 is offered in prizes by the association in each of the five dairy breeds—Jersey, Ayrshire, Brown Swiss, Guernsey, and Holstein. In addition, the Holstein-Friesian Association of America offers $2,500 in special prizes for that breed and the Brown Swiss Cattle Breeders' Association offers $550 in special prizes, making a total offering of $29,250 in cash prizes.

The dairy cattle classes of the Tri-State Fair at Memphis, with which the Exposition is to be held, have been discontinued in favor of the National competition, with the exception that special classes are offered for Jerseys, Guernseys, and Holsteins, with liberal prizes in each class. Entries in all classes close September 24.

Early interest indicates a wonderful cattle show, including a large representation from the South as well as many of the large herds which exhibit regularly. Jersey exhibitors in Texas already have made plans for taking their state herd direct to Memphis after the judging at their state fair at Dallas the week previous to the Exposition.—National Dairy Association.



Meridale Jerseys Average $881.41

Meridale Farms' annual Jersey sale held June 17 at the farm at Meredith, N. Y., was very much of a success as their sales always are. This one broke all sale records for the breed for the past three years by bringing an average of over $881 for 39 head that were purchased by 14 buyers from 9 states. The top price, $5,700, was paid for the champion imported butter cow of the breed, Dairylike's Madcap, that produced 960.72 lbs. fat from 15,571 lbs. milk in a year. She was purchased by W. R. Kenan, Jr., of New York who has more than a few heavy producers in his herd.

Nine animals sold for $1,000 or more and only 5 for less than $500.

An English clergyman was telling his flock about the terrible effects of strong drink, and concluded with the words: "I hope the day will soon come when every bottle of this cursed liquor will be taken away and emptied into the nearest river. . . . We will now sing Hymn No. 204: 'Shall We Gather at the River?'"

JAMISON BROS. APPLETON, WISCONSIN

Feed Cost of Heifers

HOARD'S DAIRYMAN:—Feed cost records were kept on heifers in a number of the association herds in the Gooding—Jerome Cow Testing Association in Idaho, from March, 1925, to March, 1926, to determine what it was costing the members to raise their heifers to producing age. Ages were based on the age of the animal in March, 1926, and are divided into three groups as follows:

Group I—2 years old, 12 to 24 months inclusive.

Group II—18 months old, six to 18 months inclusive.

Group III—One year old, birth to 12 months inclusive.

Feeds consumed were based the same as in cow testing records, hay was based on the assumption that an animal will eat three pounds of hay daily for every hundred pounds live weight. When succulent roughage was fed, less hay was consumed. No hay was charged to the calves until they started eating it. Silage, grain, skimmilk, and whole milk were weighed once each month, as it was fed; no uneaten feed was weighed back.

Alfalfa hay, the only dry roughage fed, ranged from $5 to $10 a ton; corn silage from $4 to $5 a ton; mangels or carrots, $4 a ton; the various grains ranged from $1 to $1.50 per hundred, barley being fed for the most part with some mixtures of oats and corn. Bluegrass pastures were used for the most part, with a few members having sweet clover. Pasture was figured at $2 a head a month for mature cows, the heifers being charged according to their size. Group I was charged two-thirds full price; Group II, one-half full price; and Group III, three-eighths full price.

The following table gives the detailed results of year costs of feeding heifers of different ages:

	Group I	Group II	Group III
Number of heifers	40	39	15
Age at start in months	12	6	1*
Succulent roughage, lbs.	253	181	30
Dry roughage, lbs.	1878	1329	949
Concentrates, lbs.		6	6
Skimmilk lbs.		1527	2638
Whole milk, lbs.		30	188
Days on pasture	182	172	154
Cost of roughage	$15.17	$11.55	$9.68
Cost of grain		.02	.07
Cost of skimmilk		$4.58	$7.91
Cost of whole milk		.55	3.68
Total cost of feed	$15.17	$16.70	$21.34

*Or less than one month old.

Idaho. T. E. SPEEDY.

Serradella Holstein Records

Six heifers, seniors yearlings and junior two-year-olds, in the Holstein herd at Serradella Farm, Michigan, have recently completed year records that average 13,920 lbs. milk, 453.5 lbs. fat (566.9 lbs. butter).

Buy that herd bull from a Hoard's Dairyman advertiser. You'll be better satisfied.

There Are Few Opportunities to Buy A Bull Like This!

Nine daughters of Segis Walker Matador have complete year records to date. These nine average 1,042 lbs. of butter in a year. Three more are now on test, all going at a 1,000-pound rate.

Here is a bull from a 21.9-pound 2-year-old daughter of Segis Walker Matador. Her older full sister made 1,027 pounds of butter as a 4-year-old.

The sire of this bull is the oldest son of the World Champion cow, Segis Pietertje Prospect. This bull is a paternal brother to our popular junior sire, Carnation Prospector, and looks for all the world just like he did at the same age.

Unless the dam increases her record before you buy, you can get this bull at a reasonable figure.

We advise you to write us immediately.

AMAZING, *New* Spreader Boosts Crops and Profits

Spreads like a carpet . . Insures quick absorption . . Prevents burn-outs

THE Superior Blackhawk Spreader has an amazing record for helping farmers increase crop yields. It is helping them get thousands of dollars in extra profits. It is helping them get earlier crops, bigger crops, better crops—crops that bring the highest market prices. And what the Superior Blackhawk is doing for others it will do for you! *It will pay for itself many times over in actual cash returns*—not to mention the time and work it saves.

If you are hauling and scattering manure by old, slow, costly and laborious methods; if you are using a spreader that wasn't built right to start with—or one that has seen its best days—read why it's real economy to replace it with a Superior Blackhawk now.

Only the Superior Blackhawk Can Give You All These Features

Don't confuse the Superior Blackhawk with other spreaders. See it at the nearest Superior agency—or on some neighboring farm. Note the difference. *The Superior Blackhawk has features that are revolutionary.* Many of them are patented.

The Superior Blackhawk is built low for *quick and easy loading.* It is the *easiest hauling spreader* ever built. Alemite lubrication keeps all working parts in perfect condition. Automobile type mounting in front gives a *shorter right-angle turn* than any other spreader.

Think what it means! It means less work for you. It means less work for your horses. You can haul more loads and cover more ground in a single day. And that is not all.

No Other Spreader Like It

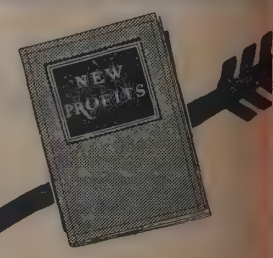
The Superior Blackhawk completely pulverizes every particle of the manure. It spreads it over the field in a broad, smooth layer. None is wasted. No part of the field gets too much. No part gets too little. The manure is spread as smooth and even as a carpet. All of it becomes available as plant food. And how crops grow! This is the most effective method of fertilization known today.

The Biggest Value for Your Money

The Superior Blackhawk not only does quicker work and better work but it lasts longer. *It's built to last.* It's made to give you more years of service than any other spreader. All working parts of the beater, wide spread device, and power transmission are mounted at the rear of the spreader in a unit frame with self-aligning bearings that cannot get out of alignment. The feed mechanism is of the simplest construction, with only a few moving parts. This simplicity of design combined with sturdy construction means a spreader that is the cheapest to buy and the cheapest to use.

Be Sure It's a Superior Blackhawk

See the Superior Blackhawk at your dealers. See for yourself why it's better. See for yourself why thousands of farmers are buying it in preference to all other spreaders.



And by all means read the information contained in our new free book "New Profits." Ask for this valuable book today. No cost. No obligation. Simply sign and mail the coupon. *Do it now.*

Polarine

THE PERFECT MOTOR OIL

(Special Heavy)

Is the Fordson's Faithful Friend

YOU can trust your tractor to the care of Polarine. For Polarine is a faithful friend — never varies from one year's end to another. Whenever — wherever you buy it you know what you're getting. Polarine never disappoints you. It's one of the few *sure* things.

A lubricating oil has a big responsibility. Maybe you've never thought of it that way before, but consider for a minute the work it must do.

Every moving part of the engine of your Fordson must be covered by a film of oil and *kept covered.* If the inside of the engine is not protected in this way, trouble starts. Heat and grinding grit are two destroyers that are always ready to eat away unprotected parts.

It's up to Polarine—Special Heavy—to protect the engine of your Fordson by spreading its tough film over every vital part.

Thousands of Fordsons throughout the ten states of the Middle West are pulling away faithfully, doing all kinds of work and doing it well because they are perfectly lubricated—with Polarine —Special Heavy.

Polarine—Special Heavy—is the right oil for your Fordson. Polarine—Special Heavy—was made for it. The lubricating engineers of the Standard Oil Company (Indiana) made a special study of the Fordson tractor and its requirements in order to develop a lubricating oil that would be *exactly right.*

There are other grades of Polarine for other makes of tractors. If you want to get maximum work out of your tractor — at a minimum cost — use Polarine—of the correct grade.

Standard Oil Company, (*Indiana*) **910 South Michigan Avenue CHICAGO, ILLINOIS**

PROTEIN—NEW ENGLAND'S HANDICAP

FORD S. PRINCE, NEW HAMPSHIRE

may be stretching the truth to ay that Yankee farmers are agi- ated over anything. But it cer- y is a fact that many New Eng- dairymen are beginning to be- their milk costs are too high. does not have to travel far to the atmosphere which would lead to believe that there is consider- worry and much thought about to solve the problem of ring more protein on the ıs of New England.

would be a long story to now a situation has de- ɔed whereby these same cee farmers have passed a position of independ- in their feeding opera- to one of absolute de- ence upon grain grown ɔther states to furnish ein to their herds, until are spending nearly fif- nillion dollars annually the grain necessary to nce their dairy rations maintain a fairly high of milk production.

hile this staggering to- ıay mean little to the or- ry reader, translated in s of expense it means verage annual outlay of dollars for every cow in section.

ese same Yankee farm- probably never read ster's definition of pro- as, "an alkali albumi- formerly supposed to be basis of all albuminous ances." They would de- protein as an expense e necessary to balance feeds they now grow.

ıce, when labor was p, they had it in abun- e. Now they buy it. And are beginning to won- f there is not some way rowing more of it on own farms to ease up ıe daily feed bills.

ıe growing of grain on a e scale is not coming into most sections of England. The topog- y of the land and high costs seem likely to ude that possibility. ns adapted to such ures can usually be put ish crops in which there is a er profit.

ıe problem of protein narrows it- down to one of growing better hage, for New England farmers produce more protein per acre igh quality roughage than they n grain.

comparing, for example, a three- crop of alfalfa hay with corn or we find it would take three acres rn or four acres of oats to pro- as much protein as is found in ıcre of alfalfa.

ıis fact is beginning to run riot amongst certain dairymen in New England and many are making a modest start in the alfalfa game. Some few have even gone as far as they can with it and are producing all the alfalfa hay they need.

James Monahan, New Hampshire, is such a man. He has twenty-five acres of alfalfa, gets two cuttings a year, and has an abundance of this high quality forage to feed his cows. "I'm not feeling too badly," he said last January, "over the fact that I still have forty tons of alfalfa hay in the mow."

Instances like this might be multiplied indefinitely to show how certain farmers are saving from one-third to one-half their grain bills by utilizing alfalfa hay. The progress that is being made is not confined to this crop. More lime is being used to get clover and where lime is applied clover lasts longer and makes for better quality hay in succeeding years.

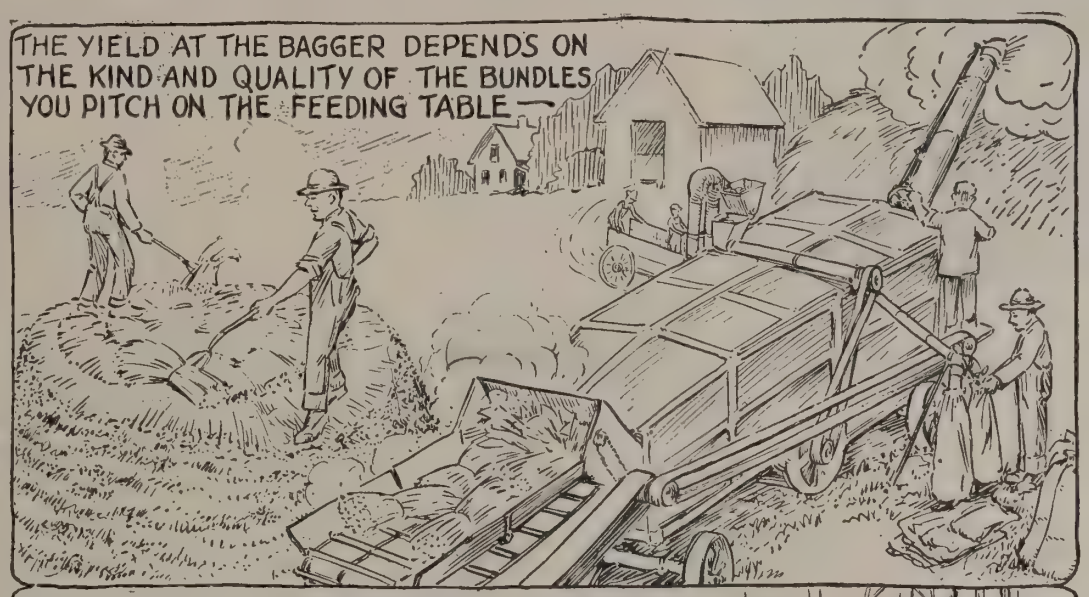
Not enough attention has been paid to alsike and mammoth clover where lime is not used. These two clovers are less sensitive to acid soils than red clover and should find more of a place on those farms where liming is not a general farm practice.

A. B. Wood is one of the farsighted dairymen in New England who recognizes these principles. He uses a mixture of oats, peas, and vetch for seeding down. This gives him a high protein annual hay crop. He sows alsike in all his mixtures and especially so if the soil has not been limed. He is also making use of alfalfa on those fields which have been limed and are adapted to the crop. Mr. Wood is one of the men who believes in cutting all hay earlier to get greater palatability and a higher protein content. He cuts his oats just after the heads appear for this reason.

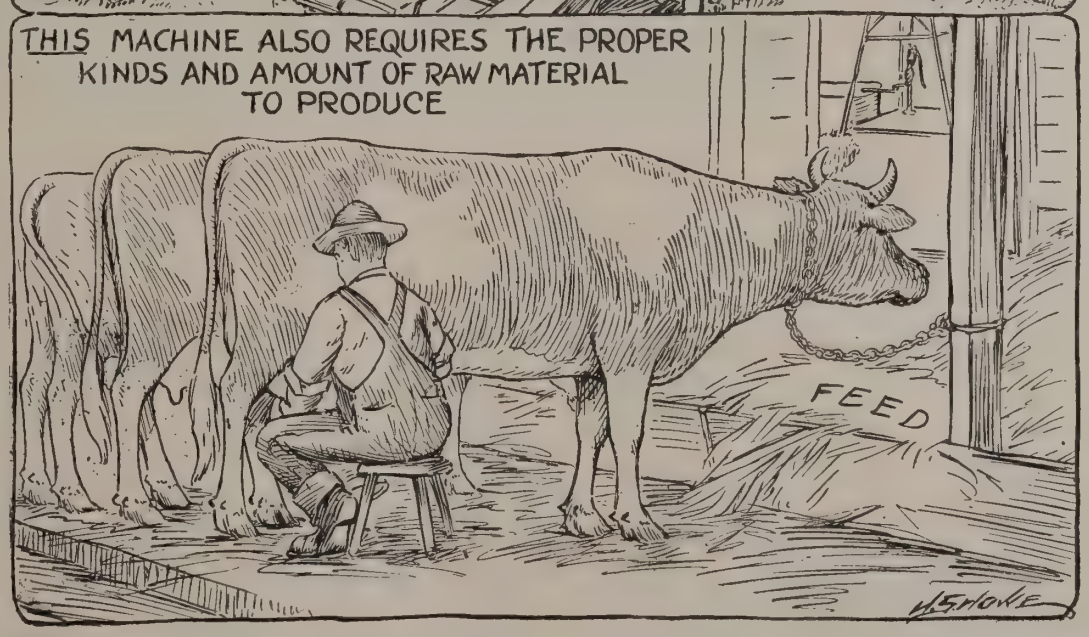
C. T. Rossiter feels that the earlier cutting of all the hay in New England would add a great deal to its feeding value and analyses which have been made prove that he is right in this respect. There is, no doubt, much that can be done to improve the quality and yield of the grass hay which now forms the greater part of all hay fed in New England. Earlier cutting, the use of lime on seeding down, and top-dressing with nitrogen fertilizers will all help the situation. Cheaper nitrates give much to hope for in this regard.

Farmers are thinking not about the feeding value of their hay alone. They are also beginning to wonder about their pastures. There is no doubt but that pastures are deteriorating. They have had no attention for years, most of them, either in fertilizing, cleaning out brush, or reseeding.

Present labor charges seem to indicate that pasture improvement should be confined to small areas which can then be seeded to sweet clover.



J. R. Graham, formerly a civil engineer but now one of New Hampshire's leading dairymen, is making use of this system. Last year he had seven acres of sweet clover for pasture. It furnished so much feed that he is planning to seed over twenty acres in 1927, enough to pasture his entire herd. With no green feed to cut and carry in the short pasture months of all the fall and with a high protein pasture crop like sweet clover saving part of the grain bills, quite a strain can be taken off the financial and labor end of the dairy business at that season of year.



The use of more agricultural lime seems to be the key to the raising of more protein on New England farms. Cheaper lime is needed to aid this progress. There is now a minimum freight rate in New England on lime of $1.80 per ton. Compare with this the minimum in Minnesota of sixty cents per ton!

High freight rates are not alone to blame. Nearly all lime shipped in New England is in bags, for which a charge of at least $1.50 per ton is paid. It would seem that cheaper freight rates to be comparable with those of other states, the use of bulk lime, and a greater volume of business for the limestone companies ought to

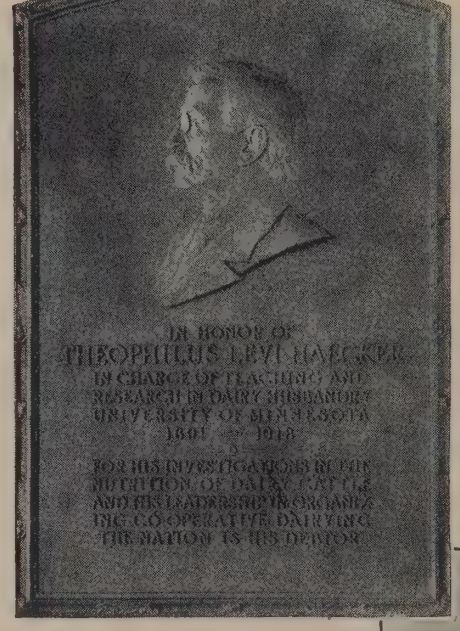
MACHINE EFFICIENCY PLUS WHAT



LIFE AND WORK OF T. L. HAECKER

No. 4

Observations on Handling and Feeding the Herd

WE come now to a very interesting and very important part of Professor Haecker's career—that period of devoted study to the scientific principles underlying the problems of feeding dairy cattle, and the practical application of these principles. Over a long period of years Professor Haecker constantly observed with a keen mind the practices of feeding cows, and from his observations made some big contributions to the cause of better and more economical feeding of the dairy cow.

We have seen how Professor Haecker related form to function in the cow, and how he diligently dug for facts on the cost of producing butter. His comment on the selection of records for experimental work shows the great pains taken to make the conclusions accurate, tells of his constant search for those practical truths which should be of the greatest benefit to the dairy farmer, and throws light on proper handling of the herd.

Things That Influence Production

"Not all of the records can be used in calculating cost of production or in forming groups based on conformation. It is found that immature cows cannot be used in making comparisons in cost of butter production, because the growing heifer always uses part of the nutriment of the feed in building the body.

"It sometimes happens that a cow in her prime does very unsatisfactory work during a whole period of lactation, simply because she did not start under favorable or normal conditions. Old cows with defective udders, impaired digestion, or unsound teeth cannot be used when careful work is intended. But if an old cow is sound, she can do as good work when twelve years old as she could when younger.

"A cow's annual yield will vary because of the different conditions which exist from year to year. Again, a cow may be temporarily out of condition sometimes during her period of lactation and thus fail to do an average year's work. Some are very sensitive and when under the care of a gruff or careless and indifferent attendant or milker will not do normal work.

Handling the Herd

"There are numerous instances where whole herds of selected dairy cows, representing the finest breeding and individually well adapted for dairy work, have proven a failure both as breeders and milk and butter producers simply because they were kept with and handled by attendants who had been accustomed to the care of beef cattle and who gave the sensitive dairy cow the same kind of treatment that they were in the habit of giving the beef animals. So it follows that there will always be a considerable diversity of opinion in regard to the merits of different breeds and types of cattle, even where the opinions are based upon actual experience and demonstration.

"It has been the purpose from the establishment of the herd to so handle the cows that they will give the greatest amount of dairy products for the maximum time at the minimum cost. With this object in view neither the herd nor a single member of the herd can be fed above a fair average ration for even a week, for by so doing her future usefulness would be in peril and the time of her dairy work shortened."

Does it make a difference as to which cows are milked first? Is there a need for milking the cows at the same time every day? How should the herd be handled for best results? These questions were answered by Professor Haecker in describing methods employed at the Minnesota Experiment Station.

HAECKER HALL AT THE UNIVERSITY OF MINNESOTA, AND ITS INSCRIPTION TABLET

Said a big metropolitan newspaper two years ago, "Five words on a bronze tablet at University Farm sum up the work of Theophilus Levi Haecker, the man who has done more than any other man for dairying in Minnesota. The words are: 'The Nation Is His Debtor.' Mr. Haecker's work, covering 27 years, was recognized recently by dedicating the new $275,000 dairy building in his honor and naming it 'Haecker Hall.'"

Professor Haecker's work dealt with every field of the dairy industry from the care of the herd to the manufacture and sale of the finished product. His leadership for the co-operative creameries made Minnesota the greatest manufacturing state in the Union of creamery butter and of the highest quality butter in the world.

His work on feeding dairy cows places him among the greatest scientific men on agricultural subjects, and yet he made his work so plain that it was understood and used by thousands of everyday farmers. It was recently said by Dr. C. H. Eckles that Professor Haecker did more to popularize the scientific feeding of dairy cows than any other man who has ever lived.

He was a lover of mankind. His sympathy went out to the men and women and to the boys and girls who were having a hard time to get along. He would make every man's road an easier one to travel. He believed in co-operation as an important factor in business because he believed in the consideration of "the other fellow." He believed that it is only through considering the welfare of others that peace and true prosperity can finally come to a community and to a nation and to the world.—A. J. McGuire.

Order of Milking

"A strict routine is observed in all the work. Feeding and milking are done at exactly the same time each day. The cows are milked quickly but gently and in regular order. There are generally some cows in a herd that manifest a desire to be milked first. Some even will begin to lose their milk if they are not first, and the order in which the cows are milked is always adjusted to these individual peculiarities. All animals are treated with kindness and no loud talking or rough handling is permitted.

"No such thing as a kicking cow or heifer is known in the herd. Heifers soon to come in are handled with great kindness and their udders manipulated to get them accustomed to being milked, and they show as great satisfaction in being milked the first time as do older members of the herd."

Will a cow eat more feed than she can make use of if given the opportunity? Based on experiments conducted up to the fall of 1895 Professor Haecker stated, "It is generally supposed that cows will eat m than they can make use of. Su however, has not always been our perience, if judicious and lib feeding is properly inaugurated continued without interrupt through the year and through a se of years. The first year a cow take more than she can make use but later she, as a rule, will not more than she needs.

How Much to Feed

"It should not be understood cows are fed without regard to qu tity. On the contrar is weighed out great care when she comes into the herd ways beginning wt several pounds below estimated feeding ca ity and very gradu increasing, keeping watch as to her appi and digestion. It t time to teach a cow she will receive feed when she nee and that there is no son for her to eat than she really wa but she will learn the course of the ye strict regularity is ni tained."

Experiments con ed during the winte 1895 led Profes Haecker to say, " methods of feeding a based upon the idea a cow well and regularly fed thro out the year and from year to would eat no more than she actu needed, and that such liberal fee would develop both her feeding and gesting powers. But in examining table with reference to the am of dry matter required by the die ent cows for a pound of producta ter deducting that required for ni tenance, it appears that those consumed relatively a large ra used nine pounds or over of dry a ter; while those that required than nine pounds consumed rela ly a small ration, which indicates some cows will eat, and appare relish, a larger ration than they digest and assimilate."

She Does and She Doesn't

All of which leads us to bring a very apt phrase coined by Pro sor Haecker—"Surely the way the cow are very strange. She and she doesn't, and then again does neither." These words written about an experiment tod

(Continued on page 814)

Honorary Recognition by University of Wisconsin

Theophilus Levi Haecker, pioneer organizer of co-operative dairying and tireless investigator of live stock problems, has in his life of service made a contribution to agriculture which marks him as an outstanding figure wherever the industry of dairying is practiced.

From Wisconsin, the state of his nativity, he carried to Minnesota fresh knowledge of dairying; and it was through his far-seeing application of modern methods to that industry that that state became the leader in butter production. In spite of the handicap which he experienced in a lack of educational opportunities, few men have done more than he to advance the sciences of dairying and animal nutrition. His example most emphatically illustrates the possibility of accomplishment which energy and perseverance can achieve here in America.

In recognition of his work and influence as one of the world's great leaders in co-operative dairying and live stock husbandry, the faculty of the College of Agriculture has chosen to honor him, and I present him to you, Mr. President, to receive the testimonial of honorary recognition awarded by the regents of this university.

THE VETERINARY SITUATION

Welfare of Live Stock Industry Endangered as Shortage of Trained Veterinarians Approaches

D. S. BURCH, WASHINGTON, D. C.

A CAREFUL appraisal of conditions within the live stock industry and those dealing with eterinary education points to a se- ous shortage of trained veterinarians ithin a few years. In some fields the iortage is already here and being lt. This forecast of inadequate pro- ction to the live stock industry, at ast for a considerable period, is sup- orted by very definite evidence. It is situation that demands the earnest tention of stockmen and probably ill be remedied only by greater in- rest among young men in the vet- nary profession, when its oppor- nities become more apparent.

Meanwhile stock owners must pre- are for a shortage of ained men in this pro- ession until the law of pply and demand re- ores normal equilibri- m. On the basis of the our-year course of aining now given by 1 veterinary colleges the country, an up- ard trend in supply can ot occur before 1931 nd may not come until onsiderably later.

eterinarian Invented neumatic Tire and repared Way for Auto

As a profession, that f veterinary medicine nd surgery has had a ost eventful career. s beginning occurred France about 1762 ith the object of train- g men to save horses jured in war. In time e veterinary schools, tablished for that pur- ose, extended their field include means for ombating destructive iseases that were rav- ging the country.

The first veterinary college in the nited States was established in New ork City in 1857, primarily to give struction in the treatment of horses.

Curiously it was a veterinary sur- eon who, in 1888, made the first neumatic tire which was the fore- nner of the bicycle and the modern xurious automobile. Having a son ffected with spinal trouble this veter- arian, John B. Dunlop of Belfast, eland, fastened three crude circular irbags to his son's tricyle wheels to ften the sidewalk shocks. With the evelopment of the pneumatic tire in- ustry and motor transportation re- lting from those tricycle tires, horse ractice, the mainstay of the veterin- ry profession, began to be threat- ened. But at the time there was no means of knowing what the future had in store.

Meanwhile, by 1892 four veterinary colleges in the United States were giving courses and by 1916 the number had increased to 21 with an enrollment of nearly 3,000 students.

Colleges Close and Enrollments Decline

By a strange psychology the name "horse doctor" had made an indelible impression on the public mind. And with the gradual disappearance of livery stables and other evidence of horse travel, veterinary training began to go into eclipse. One by one the 12 private veterinary colleges closed their doors for lack of students. The last of the private institutions, now having only four students, will go out of existence this year. Only state colleges giving a full four-year course of study in veterinary medicine and surgery now remain.

From enrollments totalling nearly 3,000 students ten years ago, the number of young men taking veterinary courses in the thirteen colleges in the United States and the one in Canada dropped to only 582 last year. This was the total for all classes—freshmen to seniors. Graduates from the same colleges in 1926 numbered only 132, or 11 less than in 1925 and 28 less than in 1924. Records for the period from about 1910 to 1918 show that the veterinary colleges were graduating about six times as many students then as now, though it is proper to say that the course of study now is longer and the requirements for graduation are stricter. But the decline in graduates and of interest in veterinary education form one of the most serious conditions which the live stock industry faces today.

The present number of graduates is less than enough to fill the vacancies in the U. S. Bureau of Animal Industry alone, which needs trained veterinarians for its federal meat inspection, for tuberculosis eradication, and many lines of highly important inspection and quarantine work at public stockyards and at seaports. This federal service is also essential as a basis for our exports of meat and it has been chiefly responsible for protecting American live stock from foreign plagues and the spread of diseases from one state to another.

The Bureau of Animal Industry alone employs about 1,350 veterinarians, and their resignations and separations average about 10 per cent a year. So it is plain that with only about 132 graduates altogether and 135 new positions each year in this one field, to say nothing of many other fields, a good veterinarian will soon be at a premium. As evidence that the shortage is already at hand, the U. S. Civil Service Commission in its recent announcements of examinations for junior veterinarians at an entrance salary of $1,860, stated, "As the commission has had difficulty in securing sufficient eligibles for this position, qualified persons are urged to apply." This virtually amounts to recruiting for veterinarians.

PREPARING TO MAKE AN INTRADERMIC TUBERCULIN TEST

This branch of veterinary service has become extremely important in recent years in view of the strong public sentiment for tuberculosis eradication.

Horses in the United States still number about 17,000,000, a sizable equine population in spite of motor transportation. There is only one trained veterinarian for every 1,700 horses, according to best estimates, to say nothing of veterinary requirements for cattle, sheep, swine, and smaller animals.

The Lesson From Last Year's Serum Shortage

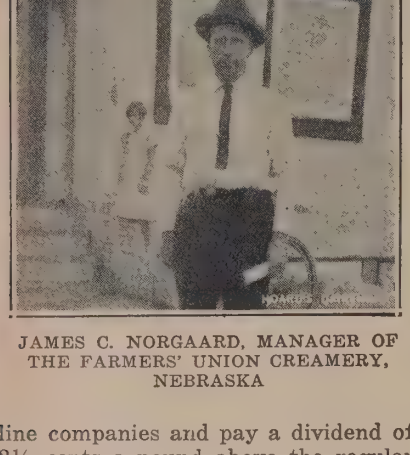
From the standpoint of the average live stock owner, the situation may seem to involve no immediate concern or preparation. "Oh, well, I'll manage to get along," is probably the natural reaction. That was evidently the sentiment among swine owners early last September before hog cholera ran amuck. But in the crisis, apparently unaffected by the law of supply and demand, the supply of the protective serum ran out. Nor could any human power make serum over night. It is a process normally requiring about two months. And before serum enough could be made, about 1½ million hogs in the corn belt died of cholera.

How much more serious, then, is a shortage of men trained in veterinary medicine and surgery, a profession that requires at least four years of in-

(Continued on page 817)

BACON HOGS FOR EXPORT

The export trade of the United States in meats and meat products is based on federal meat inspection, which is essentially a veterinary operation.



INSPECTING IMPORT CATTLE FROM MEXICO FOR SIGNS OF DISEASE, CATTLE TICKS, AND OTHER PESTS

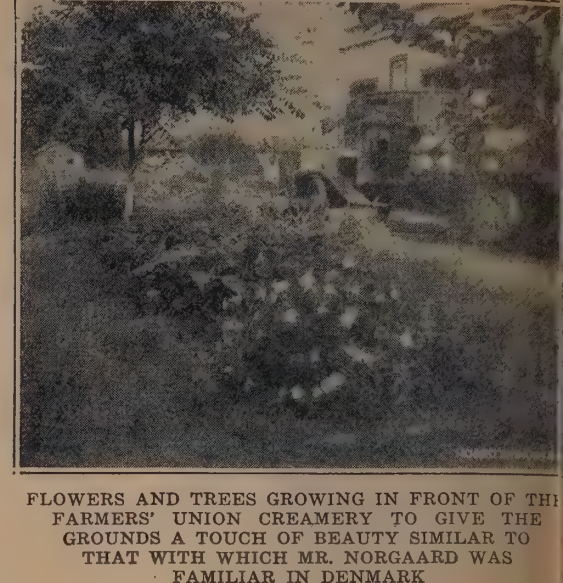
Important work of this kind is entrusted only to trained and experienced veterinarians.

Successful Co-operative Centralizer Creamery

GUY A. PETERSON, WISCONSIN

JAMES C. Norgaard, manager of the Farmers' Union Creamery at Superior, Nebraska, is proving that farmers can operate a centralizer creamery in competiton with the old line companies and pay a dividend of 2½ cents a pound above the regular market price as set by the private companies.

JAMES C. NORGAARD, MANAGER OF THE FARMERS' UNION CREAMERY, NEBRASKA



This co-operative creamery was organized in 1918 when 29 stockholders furnished the funds to get a little 600-pound a week plant started. Today the organization boasts a thousand stockholders, six thousand patrons, and an annual output of more than two million pounds of butter.

Mr. Norgaard has been the motivating influence in this phenomenal growth. He was born in Jutland, Denmark, in the community where the world's first cow testing association was organized. It was here that he learned some of the essentials for success in dairying because he was at one time the youngest government cow tester in Denmark. Just before the outbreak of the world war he emigrated to Waupaca, Wisconsin. He couldn't learn English there, however, because nearly everyone he met spoke Danish, so he got a job in New London, Wisconsin. He had been living with a German family on a farm near that town for some time before he discovered that it was German they were speaking instead of English. Finding it difficult to learn the American language in a community where so many people spoke German, he secured employment in the Green Bay co-operative creamery where he worked until the autumn of 1915 when he left for the Wisconsin College of Agriculture to take the butter and cheesemakers' course. So well did he acquit himself in this work that he was offered the managership of a small creamery in Harbor Beach, Michigan. Harbor Beach is a summer resort that is visited by great numbers of well-to-do people from Detroit. These visitors got a taste of the good butter that Norgaard was making and not wishing to be deprived of it upon their return, they asked if they could get it by parcel post. As a result, the entire output of the creamery is now either sold locally or in five-pound parcel packages. Up until the time that Norgaard left in 1917 to become an instructor in the dairy department at Madison, Wisconsin, the Harbor Beach creamery plant had never lost a penny on a bad account.

Goes to Nebraska

At the close of the dairy course in 1918, Norgaard accepted the call to manage the little creamery in Nebraska that is the subject of this sketch. He had hardly gotten things started, however, when a fire burned the plant to the ground in May, leaving him without a place to work. He finished out the season inspecting navy butter in Minnesota, but he came back to Superior the next year to reorganize the co-operative that he now manages.

At first Norgaard had the usual fight with the old line centralizers. He said that more small centralizer factories and co-operative creameries have gone bankrupt or stopped operating in Nebraska than in any other state. He told us that nearly eve small town in the state has had creamery at one time, which in m instances nad been started by a p moter who wanted to sell creame equipment, but who took no troul to find out if such a plant could economically operated.

FLOWERS AND TREES GROWING IN FRONT OF THE FARMERS' UNION CREAMERY TO GIVE THE GROUNDS A TOUCH OF BEAUTY SIMILAR TO THAT WITH WHICH MR. NORGAARD WAS FAMILIAR IN DENMARK

FARMERS' UNION CREAMERY AT SUPERIOR, NEBRASKA, THAT IS NOW MAKING APPROXIMATELY 2,000,000 LBS. BUTTER ANNUALLY

Need Large Volume

"A centralizer creamery in Kans and Nebraska," said Norgaard, "h to make at least a million pounds butter in order to properly grade and secure the advantages of car shipping. Shipping by car load ra makes a difference of 1½ to 2 cen a pound, so we are saving the farm $20,000 in freight alone by being a to ship that way. Save for a few ex ceptions, the farmers around he milk cows mainly as a side line, so is naturally more difficult to p across a grading program, but we a gradually working toward the goal payment according to grade. It co three cents a pound to handle cream at the cream stations, abo two cents for transportation, and e have to pay cash for the cream o keep our customers from selling o the old line buyers.

"We divide the cream into the grades as it comes in from the s-

(Continued on next page)

An Interview With Lightning

A MANUFACTURER of lightning rods has issued a short pamphlet in which he presents an interview with lightning as though it were some noted person in whose personality and activities people are interested. This personified lightning answers questions about himself such as occur in the minds of property owners and his answers tend to do away with misunderstanding as to the causes and effects of the so-called and miscalled lightning stroke.

We take pleasure in presenting this interview to the readers of Hoard's Dairyman, many of whom will not have the opportunity of seeing the original pamphlet. It is as follows:

Question: How old are you, Lightning?

Lightning: Many centuries—as old as the Universe.

Q. Where do you live?

Lightning: During normal electrical conditions my home is in the earth, but during abnormal electrical conditions such as storms, I am in the clouds as well as earth.

Q. What are you?

Lightning: I am electrical energy existing in positive and negative forms which, when divided, attract each other.

Q. Why do you jump to the earth?

Lightning: Because the atmosphere is a dielectric and offers resistance. I build up a large quantity of positive electrical energy in the clouds; the attraction of negative energy in the earth attracts and enables me to break down the atmosphere, and this breaking through the air has been named after me—Lightning!

Q. It seems you have had unlimited power. Who first interfered with this power?

Lightning: Benjamin Franklin discovered that I was a form of electrical energy and could be controlled. He then erected metal conductors over buildings, making it impossible for me to damage them. These conductors were called lightning rods.

Q. Why the lightning stroke?

Lightning: It is the result of these abnormal electrical conditions similar to the breaking of a dam or a water flood as an overcharge of energy is seeking an opposite electrical energy in the earth. In the form of flood this energy breaks through, developing into a lightning stroke.

Q. Why the fire?

Lightning: When I break down the atmosphere and rush through objects such as wood, trees, etc., almost instantaneously a fire is produced on account of great resistance.

Q. Then if there is no resistance, you cannot do damage?

Lightning: No, I cannot do damage. When lightning rods are on buildings they afford an easy, free path. They allow electrical energy to waste away from the points of the lightning rod and prevent the electrical energy from storing up in the building and attracting me from the cloud.

Q. Do trees protect buildings?

Lightning: No, they are not good conductors and add a danger if closer to the building than its height. Such trees should also be protected with lightning rods.

Q. Does metal attract you?

Lightning: No, the only thing that might be said to attract me is the opposite electrical energy stored up on the surface of earth and on buildings.

Q. Do all metals have the same conductivity?

Lightning: Copper is best as it is six times better conductor than iron. Furthermore, copper does not rust. It is very permanent and efficient.

Q. Why do you usually burn barns when you strike?

Lightning: Hay is of a very combustible nature and especially when barns are filled with new hay. This being damp, often a gas accumulates which a very small spark will ignite. The new hay adds to the storage capacity, allowing electrical energy to bunch up. Horses and cattle in barns add to this hazard and are usua burned to death. A lightning str fires the barn in several places once, making one of the most difficl fires to put out.

Q. What do you know of insura companies?

Lightning: They are proving a handicap to my fire waste by ad ing the use of lightning rods and charging a lower rate of insura on farm buildings when protec with standard lightning rods.

Q. Tell us how we may kn standard lightning rods.

Lightning: The Bureau of Sta ards, Washington, D. C., has p pared a code known as the Natio Lightning Rod Code approved adopted by the National Board Fire Underwriters and Underwrit Laboratories. The U. S. Weather B reau has issued a 35-page Booklet, 1512, devoted entirely to lightn rods, strongly recommending the of the best type of equipment. Su important approval makes the lig ning rod business a scientific very important industry, capable preventing me from damaging destroying buildings.

"Here is a letter for you with a black border!"

"Alas! My poor brother is dea"

"How do you know? You have't read it yet!"

"No—but I recognize his ha writing."

Successful Co-operative Centralizer Creamery

(Continued from page 794)

ons and make three grades of butter om it. These are 90 score, 89 score, id 87 score. This is not so good as made in sweet cream factories here the farmers make dairying eir chief occupation, but it is bet- r than it formerly was and we are oking forward to improvements as ir educational program goes on."

Acting on the assumption that it is ser to proceed slowly and surely an to attempt the more spectacular ethods, Norgaard is not trying to volutionize the cream handling ethods all at one time but his simple tter dairy rules as printed on the erature that went out from his fice the day we were there were ese:

"United we stick. Divided we are ick."

"Deliver your cream often; every her day if possible."

"Keep your cream cold."

"Keep your separator clean."

"Scald your cream can before fill- g."

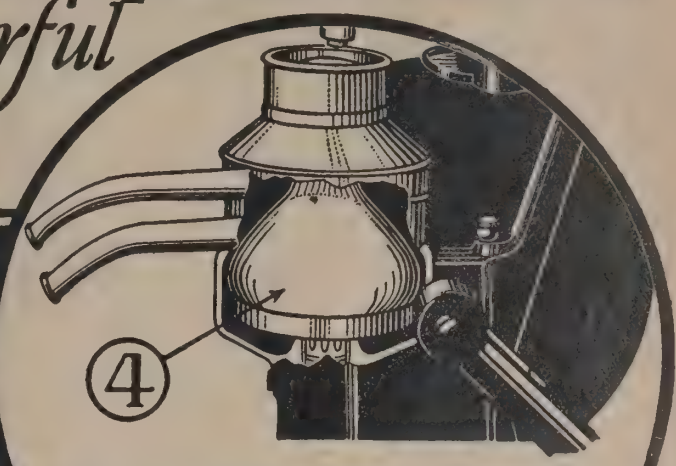
"Don't mix warm cream with cold."

Install Butter Milk Condenser

As the creamery grew, the problem disposing of the liquid butterm l came a serious one because the re not enough nearby farmers to e it as fast as it was produced. rgaard persuaded the directors to tall a condenser. He even offered work for a year at a salary equal the dried buttermilk sales less st of operation. Some doubted the sdom of the move but the plant s installed at a cost of $15,000 and s so arranged that the buttermilk used to cool the pipes of the ice chines before it is pumped up to condenser. After three-fourths the entire creamery coal bill, three- rths of the creamery water bill, per cent depreciation on the ,000 worth of equipment, eight per t on the investment, fireman ary, cost of barrels, and all sales penses had been charged up to the termilk department and paid, re still remained a $5,000 profit the t year over and above what had merly been received for the liquid termilk. Here is another instance ere the volume of product makes economical handling, because all creameries could not hope to similar results by installing such ipment.

Fights Fire With Fire

Norgaard said that Kansas and braska need a dairy law similar to one in Minnesota that prohibits am buyers from paying high prices some communities to stifle com- itors, and from making up their ses by paying low prices in other ces where no competition exists. found this practice to be the ue in this territory, so rather than t these competitors by paying re than the market price on cream his own territory, he started a few all cream shipping stations way side of the economical territory the Superior plant, so he could up discord by offering higher es for a small quantity of cream the territory then controlled by centralizers. He published cream cks paid by these companies show- that they were paying high prices towns where the Farmers' Union amery had stations and low prices owns where there were none. The e outlying cream stations "did work" and the private companies ed off the war. As a result, there very prospect that the creamery grow bigger and better for a time to come, because more and e of the farmers who patronize it are finding dairying a more profitable enterprise. They are sowing sweet clover and alfalfa pastures to withstand the drouth that is so often experienced in this territory and they are digging more pit silos in which to store succulent feeds for their herds which are growing not only in number but in quality as well.



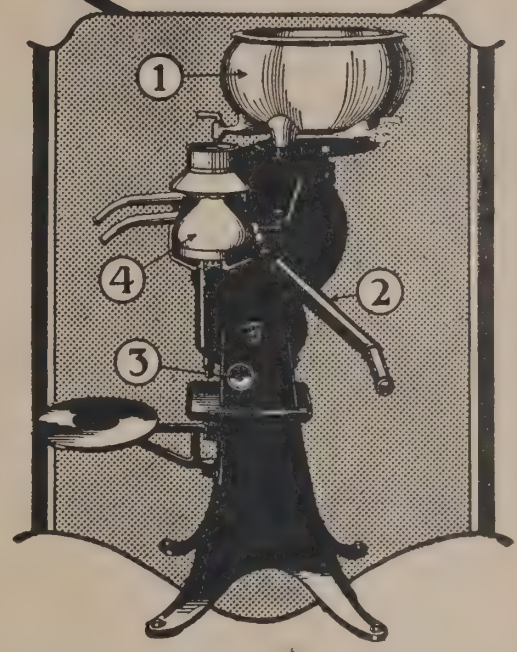
This writer does not wish to minimize the good that the old line creamery companies have done for the scattered dairy farmers in the states where dairying has not yet become generalized, but he does deprecate the discriminatory practices that have been and still are followed to suppress competitors or quell co-operative companies. Therefore, whether Norgaard is to be complimented or condemned for using the old line tools is a question, but one must give him credit for beating the trust at its own game.

Selling C. T. A. Memberships

One of the most ardent advocates of cow testing association work we have ever talked with is Fred Vander Mulen of Missaukee County, Michigan. When the Falmouth Association was first organized, Fred took upon himself the greater part of the burden of selling memberships to the required number of farmers. He drove a good many miles and presented his selling arguments to a good many farmers without encouraging returns. Finally he hitched a new argument on as a final word and thereafter was encouraged.

"I told the farmers to try it a year," said Fred, "and if at the end of that time they were not satisfied the benefits are worth more than the costs, I will pay all the costs myself." He took great delight in telling us that "none of them have come after any money."

The 1927 SERIES De Laval Separators have the wonderful Floating Bowl



The most wonderful separator bowl ever made. It is self-balancing, runs smoothly without vibration, skims cleaner under all conditions of use, delivers a smoother, richer cream, and requires less power to operate.

Not just a one-feature separator but superior in every respect—in skimming efficiency, ease of operation, convenience and durability. That's why users everywhere who have seen and tried them say they are the "best yet"—and the best made by De Laval in almost 50 years of separator manufacture and leadership. Other new features are:

1. Turnable Supply Can: The supply can may be turned so that tinware and bowl may be put in place or removed without lifting the supply can from its position on the separator. Every user likes this feature.

2. Easier Turning: For three years the De Laval experimental and engineering departments have been conducting extensive tests to develop still easier turning separators. The results of these tests are embodied in this new series, which both start and turn easier.

3. Oil Window: The new oil window enables you to see at all times the level and condition of the oil. It shows at a glance whether or not the separator is being properly oiled.

Ask your De Laval Agent to let you try one of these new De Lavals. You will agree you can't afford to use any other. Sold on easy terms. Trade allowances made on old separators.

Address.....

"Better than Barrels of Hot Water"

Avoid Hot Weather Milk Troubles

DIVERSOL

destroys the bacteria that cause:

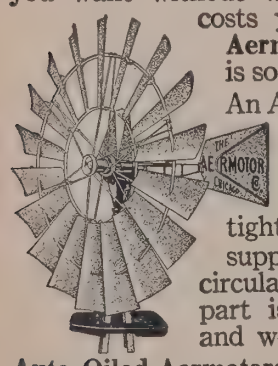
Sour Milk | "off flavors"
"Ropy Milk" | foul odors

NOW! You Can Be Sure of Premium Priced Milk

Diversol now makes it *easy* for you to keep bacteria under control and *economically* produce clean, low bacteria count "premium-priced" milk. 85% of bacterial contamination comes from milk utensils and equipment. Diversol now makes it EASY for you to keep them fresh and clean and free of the bacteria that spoil your product.

MORE—*than a washing compound.* —*than a sterilizer.* It's both!

Diversol does *more* than any washing compound or sterilizer—it destroys bacteria as it cleans, and removes foul odors—instantly with ONE operation. You don't need steam. One warm or cold water rinse with Diversol—and you're through! You make your own solution—easily and quickly with cold water. *Very economical!* One pound makes 100 gallons of sterilizing solution. Keeps forever. Never deteriorates. Non-poisonous. Never injures hands.



Mail Coupon for FREE Supply

Every man producing or handling milk, cream, butter, cheese or ice cream should investigate this great NEW dairy discovery. The coupon above entitles you to enough Diversol—FREE—to make 25 gallons of sterilizing solution. Send for this liberal FREE supply—mail coupon now—SEE what Diversol will do for YOU.

RUNNING WATER WITHOUT WORK

With a good Well and a good Windmill you can have all the water you want without work, worry or expense. Water from a well costs you nothing. The cost of an **Auto-Oiled Aermotor** is moderate. The expense for maintenance is so small that it need never be given a thought. An Aermotor runs in the lightest breeze. It will also work safely and steadily in the heavy winds.

The **Auto-Oiled Aermotor** is completely self-oiling. The double gears run in oil in a tightly enclosed gear case which holds a year's supply of oil. When the mill is running the oil circulates through every bearing. Every moving part is constantly and completely oiled. Friction and wear are practically eliminated.

Auto-Oiled Aermotors have behind them a long record of successful operation. Their merits are known the world over. For further information write

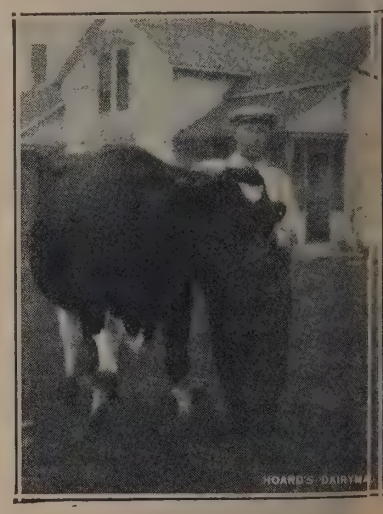
Doing the Job

HOARD'S DAIRYMAN:—The average production of the 424 cows in Caledonia—Mt. Pleasant Association of Wisconsin was 8,481 lbs. milk containing 312 lbs. fat. This is a slightly higher average than for the previous year.

Harold Proeber, a young breeder starting in pure-bred Holsteins, has given us something to think about during the past year. He is a very capable worker and at first spread his work over many enterprises. He is on a medium sized farm with little extra help. Cabbage was at first a large item but it interfered in many ways with the activities on a dairy farm. Cabbage planting interfered with the necessary cultivation of corn and cutting of alfalfa hay in the spring, and at silo filling time cabbage cutting and hauling interfered again with the filling of the silo at the proper time. The results obtained by Mr. Proeber prove, I believe, that quality feeds and proper care pay dividends when applied to the dairy cow. Comparisons of the results obtained in his herd for the past two years follow:

	1926	1927
No. of cows	14	10
Ave. lbs. milk	7,667	10,218
Ave. lbs. fat	255.0	340.1
Cost of feed	$1,229.32	$1,025.51
Profit	$1,468.37	$1,682.81



The profit with four less cows during the second year is over $200 greater than the profit of the year before. This is undoubtedly due to feeding a better grade of roughage which was put up at the proper season, to a ration balanced with proper concentrates, and to more uniformly good care of the herd. Less hired labor and other items of expense added still more to the profit the second year when no cabbage was raised. Diversification operates very nicely when two crops do not conflict as to time required in their care.

A specialist has been defined as "one who knows more and m about less and less." An equally plicable definition might be "one gives more and more active labo fewer interests." In either event is better paid than the Jack of trades, and is usually more satis in his environment.

FLOYD G. WIEDRICK, Teste

Daughter and Dam

HOARD'S DAIRYMAN:—Rhoda is daughter of Rosie, a grade Hols cow that made 663 pounds fat in

RHODA AND R. A. KLINGBEIL'S HER OWNER

This 2-year-old grade Holstein made lbs. fat in one year. She is not a spt but comes by her production through heritance. Her dam has a mature rec of 663 lbs. fat. Figured to a ma basis, Rhoda should be credited with lbs. fat, exceeding her dam's record 57 lbs.

year, according to the records o Blooming Prairie, Minnesota, Testing Association. Her sire Sir Pride De Kol Ormsby.

Rhoda freshened in the herd A. Klingbeil on January 10, 192 the age of 28 months. She mad pounds fat for the remainder of a uary, continued with 54 pound February, and at the close of th

ar was credited with the good rec-
l of 503 pounds fat. During this
ie she increased her weight from
)0 pounds to 1400 pounds. She will
shen again this fall and is still
oducing at the rate of better than a
ind of fat per day.
Rhoda is the result of feeding,
eding, and breeding by the cow
ting way.

W. W. CHRISTENSEN, Tester.

What the High Herds Received

HOARD'S DAIRYMAN:—Of the ten
h herds in the Sac County Asso-
tion of Iowa, 10 received a high
tein concentrate, 7 received a bal-
ed ration, 9 received grain on pas-
e, 3 were supplied with commer-
l feed, 8 had alfalfa, and ? clover
.

t will be noted that all received
ume hay and in general had been
l fed. Improvement could be
de in succulence, as only four
ds were supplied with silage.
These herds ranged from 326 to
lbs. fat per cow. From these
herds there were 10 cows sold for
f and 13 for dairy purposes.

LAWRENCE STAUFFER, Tester.

Testing Pays in California

Writing in the annual report for
Los Angeles County, California,
v Testing Association, C. V. Cas-
who compiled the report, has the
owing to say about the money val-
of cow testing:

'It is hard to absolutely get at all
values of cow testing. I know a
n that tested his cows for a year
a northern state. During that
e he paid but little attention to
at his cows were doing. He never
ed a cow. He did not change his
d. His production remained the
ie. At the end of a year his herd
as poor as at the beginning. He
l he didn't get anything out of the
ociation. He didn't.

'I know another man in a cow test-
association. He had gone broke
another business through no fault
his own and he had to start the
y business on a shoe string. He
ght up cheap cows that dairymen
in a cow testing association were
ing by guess. He didn't guess.
tried each cow he bought by the
les and Babcock test as he be-
ged to a cow testing association.
sold many cows to the butcher,
out of other people's culls he
lt up a good herd and improved
herd by using the best pure-
d sires. His cows were fed ac-
ding to production and conse-
ntly economically. He made mon-
and he will tell you that cow test-
pays.

There are a number of herds in
county that can show a good in-
ase in production the past year,
that increase when translated
dollars and cents makes it ap-
r that cow testing is worth while.
e are the results in three dairies:
In one herd 32 cows averaged
.9 lbs. fat last year and 34 cows
raged 439.7 lbs. fat this year, or a
gain of 85.8 lbs. for each cow
ch when translated into dollars
cents was $2,625.48.

In another herd 34 cows aver-
d 297.3 lbs. fat last year and 53
s averaged 380.5 lbs. this year or
in of 83.2 lbs. per cow. The in-
ase was worth $3,963.24.

A third herd of 30 cows averaged
.9 lbs. fat last year and 37 cows
raged 441.8 lbs. this year or a
of 55.9 lbs. per cow. The gain
roduction was worth $1,861.47."
is recognized that increases such
given are considerably above the
rage to be expected; nevertheless,
lit for them must be given largely
to the influences of cow testing association work. These herds were undoubtedly owned by men who get all the value out of the work possible.

Silage Measuring Tables

HOARD'S DAIRYMAN:—In your issue of July 10 there appears an article, "Are Silage Measuring Tables Correct?" The experience of Howard T. Greene in weighing a measured amount of silage shows much variation.

I am a cow tester in Tuscola County, Michigan, and incidentally have weighed the silage taken from silos one day each month throughout the year. As is our method the total is based from this weight as an average. I have always been under the impression that they did not weigh up to the tables.

Much data could be had from testers by sending out a questionnaire. The cow test books from previous years should give interesting information if taken only from herds in which all animals fed were on test. It would get information from all parts of the country and over a very large number of silos.

Kingston, Mich. W. A. S.

(EDITOR'S NOTE:—We would be pleased to have testers report on this.)

An Investment Return

HOARD'S DAIRYMAN:—The size of the average herd in the Texas Cow Testing Association is 15 cows, and the average increase in production in 10 months' time was 23.5 lbs. milk and 2.5 lbs. fat, or an increased profit per cow of $12.50. On the herd the increase would be $187.50, or $151.50 net in 10 months' time from a $36.00 investment.

Does cow testing pay in Texas? You answer.

T. H. ROYDER, Tester.

NASH

Leads the World in Motor Car Value

3 New Series
New
Lower Prices

Come drive

the easiest riding cars you ever traveled in

New Springs
of Secret Process Alloy Steel

individually designed and tailored for each Nash car

The new Nash models introduce the *GREATEST* improvement in riding smoothness developed in years.

All new Nash models are now cradled on new springs built of a secret new steel alloy.

This new material gives Nash springs a smoothness and ease of action found in no other car, *regardless of price.*

These new Nash springs are individually designed and balanced scientifically to the weight and size of each Nash model—*actually 9 different rear spring types in all.*

Every new Nash model has these unique new springs, individually tailored—and then as a final contribution to your ease and comfort—shock absorbers on every model.

Even the new Nash Standard Six models, which sell at 4-cylinder prices, are so equipped.

In all, there are 21 new Nash models for you to view. Body designs and finishes are the smartest you have ever seen, and the color harmonies are of magnificent richness.

The bodies are extremely close to the road. The wheels are small. And there are a host of other great features for you to see.

At the *NEW LOW* prices these new Nash models are the greatest values you have ever known.

Nash invites you to see them at once and have a demonstration of their great speed and power-smoothness.

[Prices range from $865 to $1990 f. o. b. factories]

New French—Canadian Record

Another breed record for the French-Canadian cattle in the mature class of the 365-day division has recently been established. "Blandine," bred by Romeo Sylvestre, Quebec, and owned by Joseph Champoux, of the same province, is the new champion with an official production of 15,860 lbs. of milk and 658 lbs. fat. "Aromaz" 1597, the ex-champion, had a production of 13,218 lbs. milk and 631 lbs. fat and was owned by the Dominion Central Experimental Farm when she made her record in 1917.—French-Canadian Cattle Breeders' Association.

Minnesota Holstein Company Makes $1066 Average

THE Minnesota Holstein Company dispersion at Austin, Minn., July 29, was the best Holstein sale since the Erickson dispersion in 1924 and one of the best sales we have ever attended because it stood out so far above all other Holstein sales of the past two or three years. The 61 head making up the Minnesota Holstein Co. herd brought $65,050, an average of $1,066. There were, in addition, eight other animals consigned, most of them partnership owned bulls, that raised the total to $68,700 for the 69 head, an average of $995.

It was a most successful sale from any standpoint and there was every reason for it being so. The herd was one of the very best in the country, of course, and every animal was in sale shape; the sale was managed by Melin and Petersen as such a sale should be, and the weather man was kind enough to furnish a perfect day. The buyers, the final necessity for any successful sale, were very much in evidence. We don't know exactly how many states were represented at the ringside, but we do know that when the sale was over the herd had gone to new owners in South America, Canada, and twelve states.

The sale was a deserved tribute to V. S. Culver's success as a Holstein breeder. He came to Minnesota from Nebraska in 1913 bringing 18 registered Holsteins, the foundation for the herd which was sold July 29; and in 1915 he made what was unquestionably his most important purchase—a half interest in Piebe Laura Ollie Homestead King, the bull which later proved himself an outstanding Holstein sire. This bull and that great old cow, South Side Inka De Kol, dam of Sir Inka Superior Segis, a later sire, were remarkably good Holsteins that contributed greatly to the upbuilding of this herd which has established a very enviable record in the show ring and at the pail. In 1919 Mr. Culver took his herd into the partnership with A. L. Eberhart to form the Minnesota Holstein Co. of which he has since been secretary and manager.

Exactly 20 of the 69 animals sold brought $1,000 or more, 7 head went to $3,000 or above, a yearling bull sold for $6,200, and a 2-year-old heifer for $7,100.

May Walker Ollie Homestead, the 12-year-old champion butterfat producer of the United States, was purchased by Nan Connoly of Minnesota for $4,000. Her yearling son, Sir Bess Ormsby May, sired by Sir Bess Ormsby Fobes, went to W. S. Kellogg of Connecticut for $6,200 with a syndicate of Minnesota breeders the last contending bidders.

May Walker Inka Segis, the 2-year-old daughter of the champion

MAY WALKER INKA SEGIS, 2-YEAR-OLD DAUGHTER OF MAY WALKER OLLIE HOMESTEAD
She topped the sale at $7,100.

MAY WALKER OLLIE HOMESTEAD, THE U. S. CHAMPION BUTTERFAT PRODUCER, BRED AND DEVELOPED BY THE MINNESOTA HOLSTEIN COMPANY
This 12-year-old cow sold for $4,000 and her 2-year-old daughter brought $7,100; her yearling son, $6,200.

A New Standard of Tire Value

All the qualities that you want most in a tire are plus factors in the masterpiece of the tire industry, the

FISK Extra Heavy Balloon

The greatest achievement of the modern tire maker. Sets new standards by giving—more mileage, more comfort, more safety, more traction, more distinction to your car.

With this latest and greatest Fisk you get a new idea of the amount of tire satisfaction your tire money can buy.

Land Banks

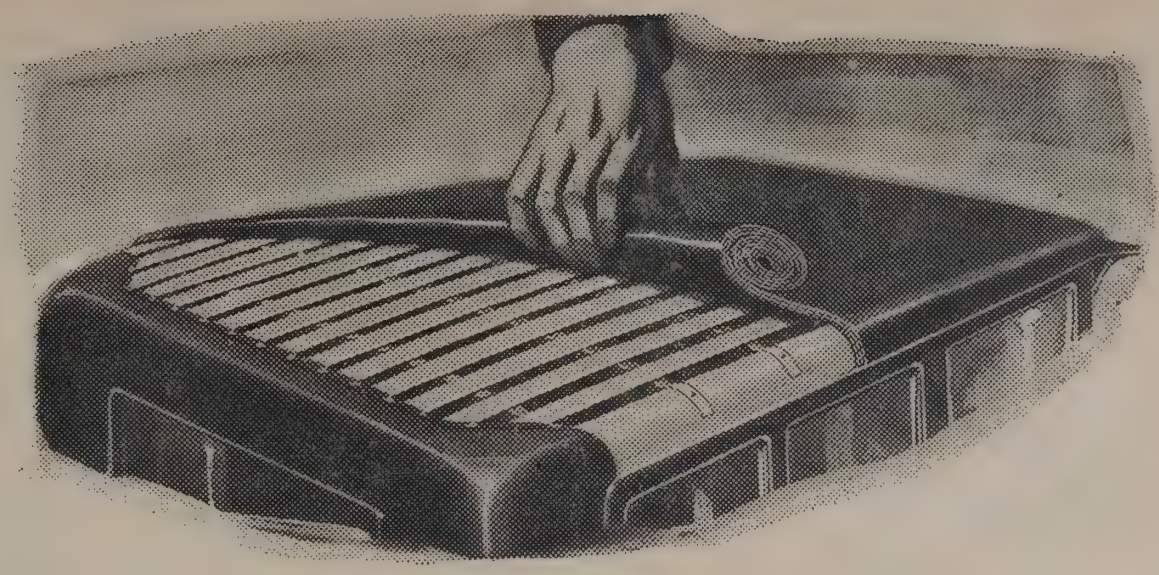
eral Land Banks, organized to money to farmers at a reason-rate of interest and on easy have been making exceptional ess. In the first decade the 12 al Land Banks loaned approxi- $1,332,000,000 to farmers, g them, with the 4,665 National Loan Associations, the largest age system in the world that serves about 380,000 farmers with "amortized loans."

These banks take mortgages on farms and then issue bonds against the mortgages and sell them to the public. These bonds have the confidence of the investors because the land has been conservatively appraised and the banks themselves have a capital of $57,000,000 and a surplus and reserve of more than $12,000,000.

Farms which come to these banks on account of foreclosure are charged off against the surplus. The total foreclosures to date amount to less than one per cent of the loans.

Recently the Federal Land Banks floated a bond issue of $100,000,000 bearing 4¼ per cent, which brought a premium of one and one-fourth points. This shows the public has confidence in this co-operative system in which each of the 12 banks guarantees the bonds of the others. Federal legislation in the past few years has brought about a system of lending money to farmers that meets well the requirements of this great industry. Credit alone is not enough to place this industry upon a proper basis, but without it there is little opportunity to inaugurate any plan which will serve agriculture adequately and well.

The South to be Represented at Dairy Show



Dairymen, railroad development agents, college workers, and business men held an enthusiastic meeting in Montgomery, Alabama, July 19 to formulate plans for promoting attendance from the Southeast at the National Dairy Exposition in Memphis next October.

President E. S. Center, Jr., of the Southeastern Railway Development Agents, called the meeting, with the co-operation of Extension Director Duncan of Alabama State College and Secretary Black of the Montgomery Chamber of Commerce. Practically every leading railroad in that section had one or more representatives present.

It was agreed that the exposition deserves the support of all interests concerned with the growth of diversified agriculture in the South. Railroad men present said they would use every means at their command to give publicity to the exposition and to organize trips and parties to attend. Extension workers from the colleges, leading milk dealers, ice cream manufacturers, and other handlers of dairy products will co-operate in reaching dairymen and farmers. A special effort will be made to enlist the support of bankers and business men because of the economic importance of dairying and its sure cash returns.

Director Duncan was pledged such support as might be needed in the development of an Alabama state exhibit as a part of the "Dairying in Dixieland" feature being prepared by some ten southern states. Plans were also discussed for insuring like exhibits from Georgia and Florida.—National Dairy Association.

"Make the best of everything; think the best of everybody; hope the best for yourself."—GEORGE STEPHENSON.

The Roof Over Your Head

Features of Fisher Roof Construction

1. The roof of every Fisher body is practically a separate assembly, resting as securely upon the body's pillars as does the roof of a home upon its framework.

2. Slats and bows form the sturdy structure of a Fisher roof deck. The bows are twelve inches apart; the slats three inches apart.

3. The bows used in a Fisher roof are *cut* to shape, not steam bent. They retain their shape permanently.

4. A layer of sound-absorbing cotton batting laid on the Fisher roof framework between two sheets of cotton cloth, reduces drumming noises.

5. All Fisher roofs are covered with extra durable weather-proof fabric—specially constructed to stand up under all conditions of weather.

Important information for every closed car buyer

Everyone realizes the importance of roof construction in the building of a home;—roof construction of a closed car is equally important, because the roof of the closed car is not only subjected to the elements but to severe strains and stresses as well. That is why in a Body by Fisher the roof is always so strongly, staunchly built. . . . The structure and the strength of the roof, as of the entire Fisher body, adds greatly to the safety of travel in all cars equipped with Body by Fisher. The Fisher roof is also far more durable . . . In selecting your next car, *examine* the roof. Ask questions about it. Find out whether it has the Fisher advantages of roof structure detailed herewith—advantages which mean greater strength, greater durability, and greater safety.

EDITORIAL COMMENT

A BRIGHT young boy once said he had a farm which was exempt from taxation, not subject to execution, and equal in value to any other of three times the area. "Where is your farm?" he was asked. "Under my hat," he replied. And he was right; every industrious, ambitious, and deserving young man has that kind of a farm by divine inheritance.

TUBERCULOSIS FREE HERDS

Considerable variation is found in the percentage of animals affected with tuberculosis in the various sections of our country. Many counties have already been tested once and many are on the accredited list. Some counties that are free from tuberculosis, quarantine against cattle coming in from other counties unless known to be free from tuberculosis. This is becoming quite the general practice in counties in our southern states where only a small percentage of animals are affected with tuberculosis and in those counties where it is found the tubercular infection can be largely traced to cattle shipped in.

We think it wise for counties practically free from tuberculosis to quarantine against the importation of cattle unless they know they are from tuberculosis-free herds. The sooner the live stock interests of this country appreciate that traffic in diseased animals is closed, the better it will be for this great industry. Too strict rules can not be made in governing the movement of cattle. These rules may seem to be unreasonable and place the shipper at a disadvantage, but the more exacting the regulations are concerning the movement of cattle, the quicker will tuberculosis be eradicated.

GAS TAX IS JUST

Why anyone should be opposed to a small gasoline tax for maintaining and building good roads passes our understanding. It has been shown that a gasoline tax is a good investment. Good roads save the wear and tear on automobiles and trucks, save time, and make motoring a pleasure. The average automobile consumes one gallon of gas in 15 miles. We believe very few motorists would object to the tax of two cents a gallon if they reflected upon the saving effected by good roads and the increased pleasure of motoring.

The Inquiring Reporter in the August 2 issue of the Chicago Daily Tribune asks the question: "How do you like being taxed for your gasoline?" One motorist replied: "I don't like it. It's an imposition on the automobile owners of Chicago, because we will be paying about 70 per cent of the tax of the whole state. They should tax farmers as well as city people. Farmers are free from the tax on account of their farm machinery, but they use the country roads more than city people do."

We hadn't observed that the Illinois gas tax law relieved farmers from paying this tax when gas is used for driving automobiles or trucks on the road. Further, we have no evidence to show that farmers use the roads more than city people. In the Year Book of Agriculture, 1926, page 414, we find the following paragraph:

" 'Very well,' says the farmer reader, 'the money spent for the state roads seems to be pretty well justified, but how much do farmers use them?' The answer is definite and clear—very little. The traffic on the state highways is largely a traffic of city-owned vehicles. In the Maine and Pennsylvania traffic surveys only 5.4 per cent of the passenger cars observed on the state highways were farmer-owned. In Ohio the percentage was 12.4, and in a count of the traffic on the Bankhead Highway at the Georgia—South Carolina line the farmers' cars made up only 8.9 per cent of the total number. A similar situation is found with respect to the motor trucks."

It will be noted that the percentage of Illinois farmers using roads compared to city users is not given but it is safe to assume that there would be no higher percentage of farmers using the roads in Illinois than in Ohio. If this be true, the people of the city of Chicago have little reason to complain even though they pay 70 per cent of the gasoline tax. Those who use the roads most should pay the most for their upkeep. Further, if it is found that too high a percentage of gas tax raised in Chicago is being used for roads, it could be directed to building and maintaining streets.

It is the height of selfishness upon the part of city people to expect farmers to build and maintain highways for them when statistics show that in several states traffic of city-owned vehicles ranges from 87.6 per cent to 94.6 per cent. Statistics gathered by the Illinois Agricultural Association show that the farmer is paying a relatively higher real estate tax than the people living in Chicago. The daily press of the city that calls upon the federal government to extend justice to agriculture should follow its own advice by supporting a fair system of taxation in building and maintaining roads.

MILK IN FACTORIES

In England the men in offices have their afternoon tea but here in America there are working men who go them one better by having fresh, wholesome milk both morning and afternoon. This has become an increasing practice in factories and offices and it has been found profitable for the management as well as desirable for the employees. It has been found that it relieves fatigue, reduces absences due to illness, and helps to avoid accidents.

One of the latest of these reports comes from the Maytag factory at Newton, Iowa, which is said to be one of the largest washing machine manufacturers in the world as it turns out 1,400 washing machines daily from its splendidly equipped plant. Each morning a milk wagon delivers a thousand bottles of milk at the factory, placing them in five large ice boxes stationed at convenient points throughout the factory. There are 2,000 workmen employed and as the recognition of the trial and value of milk spreads it is reasonable to expect the number of milk fans to increase.

The president of the Maytag Company is Mr. E. H. Maytag who is farm raised and now operates a dairy farm where pure-bred cattle are kept under ideal conditions. Perhaps it was his prejudiced influence as a dairyman that influenced the establishment of a milk service in his factory; however, the experience of other factory managers would have been sufficient inducement for its trial and final decision to continue the daily service of milk. Where it has been given adequate trial, factory management has found it desirable.

Milk dealers can increase their sales in their own community if they will only seek to have their local factories try out the plan. It not only increases sales of milk used by employees in the factory and office, but it also tends to increase the home consumption of milk by the publicity given.

DAIRY PROGRESS

At the American Institute of Co-operation, Dr. C. W. Larson, Chief of the Bureau of Dairy Industry, outlined a program to meet the demand for an adequate milk supply and also to increase the dairy farmer's income. He said the average cow now produces 4,500 lbs. milk containing 180 lbs. butterfat per year. This, he declared, was too low and pointed out that the average cow in cow testing associations produces 7,500 lbs. milk per year containing about 285 lbs. fat. This increased production of cows being tested is brought about through selection, feeding, and the use of good bulls.

"High producing cows are economical in the use of feed. A tabulation of more than 100,000 individual cow records shows that cows producing 9,000 lbs. milk per year did not eat twice as much as cows that produced 4,500 lbs. Instead they ate approximately 40 per cent more feed in dollars worth of feed per cow to produce twice as much milk and butterfat. Another tabulation show that the cows in the 9,000-lb. production class at only about 40 per cent more digestible nutrient than cows that produced half as much."

Dr. Larson also stated that on January 1, 192(there were 330,000 fewer cows than on the pre ceding January 1. We are increasing our popu lation at the rate of about one and one-half mi lion persons per year. The cow population has de creased, but we have increased production of mil to take care of the increased demands. Thi shows that the dairy industry is making progres We now have approximately 22,000,000 dair cows, and Dr. Larson says, "As a matter of fac if we were to increase the production of the ave age cow only 100 lbs. of fat per year in the ne 40 years, we could supply our increased popul tion without increasing the number of cows."

We are sure the attention of the progressiv dairyman will be challenged by this statement an reveal to him the large opportunities to increas the dairy farmer's income through better feedin selection, and breeding.

NEWAYGO COUNTY

The first cow testing association in the Unite States was organized in Newaygo County, Mich gan, in 1906, under the direction of Helmer R bild who was then with the Dairy and Food Con mission of Michigan. In the 21 years that ha elapsed, the dairy industry of Newaygo Count has met substantial progress and much of its a complishment is attributed to the good work of th cow testing association.

It required hard work to organize and to co tinue the cow testing association. The dairy lea ers of the county devoted much time in assistir to keep its membership interested and to point o the value of milk and feeding records of each co in a herd.

At a recent dairy field day meeting held by th breeders of dairy cattle in Newaygo County, th effects of cow testing work were clearly show Nearly 200 head of dairy animals, including Je seys, Holsteins, and Guernseys, were exhibit and judged. Fathers and their sons competed f honors in the show ring. No cash prizes were o fered but the winners received ribbons as recogr tion of the places their animals won. This w highly satisfactory for the honor of winning w really what created the interest and brought large number of people together on this occasio

We talked with several dairymen who belong to the first cow testing association, and it was wi considerable satisfaction that we found most them in good financial condition and pretty w satisfied with their accomplishments. Of cours they would like to receive a better price for dai products, but this is not at all an unnatural d sire. Dairy products are worth more and wh we can get the consumer to appreciate their hi food value, we may look forward to relatively be ter prices.

It was with considerable satisfaction we not that all the animals, except two, of this good loc exhibit were brought there in trucks, and all th families came to this picnic in automobiles a over splendid roads. We could not help but r flect upon conditions now and as they were 1 years ago when the first cow testing associati was started. There has been a marked improv ment in every way in the development in th county. There is no indication of the developme of the peasant type of farmers. On the contrar this county is improving its dairy practices, bree ing better cattle, looking for a better market f is products, and is enjoying the fruits of its labo At this local dairy field day there were more catt exhibited than there were at the first Nation Dairy Show 21 years ago.

Those who feel that nothing can be done to i prove the agricultural income of this country m well consider what the dairy farmers of Neway County have done and are doing to bring abo better dairy conditions and larger incomes.

An Electric Cooling Unit

Can you give me any information on making an lectric cooling unit to operate in my milk cooling ank? I know very little about electric refrigera- ion but think it would be possible to install cop- er tubing in the tank and circulate brine by neans of a small electric motor and pump.

Rising Sun, Md. E. R. ENGLAND.

Mr. E. R. Meacham has given the following re- ly to this inquiry:

"I do not think it will be at all practical to at- empt to make such a unit, but the leading electric efrigerator concerns supply units specially de- igned for this purpose. The cooling element of ny first-class refrigerator can be submerged in he milk cooling tank. If the tank is made with roper insulation in the walls and cover, an elec- ric refrigerator so arranged will produce very low emperatures in the tank. In fact, there will prob- bly be a layer of ice about the cooling element at ll times. Where this arrangement is used, it is ot necessary to install a pump to circulate the rine. The temperature of the water throughout ne tank may not be absolutely uniform, but there hould not be a variation of more than a very few egrees.

"The 'proper insulation' usually recommended is ork board three inches thick. The size of the re- rigerating unit necessary will depend upon the mount of milk to be cooled, the temperature ange desired, the condition of the tank, etc. No pecific size can be recommended without knowing ese points. Definite advice should be sought om the manufacturers or the local refrigerator ealer."

(EDITOR'S NOTE:—A description of an insulated ank such as is most often used where mechanical efrigeration is used will be found in our issue for lay 25.)

Defining Economical Production

HOARD'S DAIRYMAN:—"This herd on test for conomical production" appears on the member- ip card issued to C. T. A. members by the Wis- nsin Dairymen's Association. What does it ean? Does it refer to feed cost per unit of oduction?

My experience convinces me that the items, eturns per $1.00 expended for feed" and "feed st per pound butterfat," even though of great lue are, to those not familiar with their limi- tions, very misleading. Applied generally these gures convey the correct impression, but applied ecifically they are very misleading. Generally eaking food costs per pound of butterfat vary versely with the production.

Between herds whose feed costs per cow vary dely, figures on the feed cost per pound of tterfat and return per $1.00 expended for feed ve little significance. A small amount of grain pasture will double the feed cost, yet unless the oduction doubles, the feed cost per pound of tterfat will rise materially. However, simple ithmetic tells us that only a slight increase in oduction will more than offset the limited feed st on pasture; therefore, below certain limits oduction costs per pound fat have little rela- n to net returns. A case in point follows:

Mr. A's herd on pasture is fed concentrates in oportion to production while B's herd gets pas- re only. The record for one month is as follows:

rd	Lbs. fat per cow	Feed cost per pound fat	Returns per $1 expended for feed	Net return above feed
A	42.8	18.0c	$3.20	$17.06
B	20.5	9.2c	5.95	9.90

From the above figures "B" concluded that ice the cost of production had doubled where ncentrates are fed on pasture, it did not pay to ed them, notwithstanding the fact that "A" ac- ally made the most money.

Another case in point: "C" and "D" have iden- al production costs per unit of butterfat, name- 22.6c per pound; yet "C's" well fed herd of 24 ws clears 2.5 times as "D's" herd of 40 cows fed cornstalks, silage, and a handful of oats. These ses are by no means isolated or unusual.

Feed cost per pound of fat figures are reliable ly when considered in conjunction with the av- age herd production and the price of a pound butterfat. Figures on the return per $1.00 ex- nded for feed are reliable only when consid- ed in conjunction with the amount of money tually spent for feed.

Is economical production to be defined as pro- ction at the lowest possible cost per unit, or production at such a cost that it will reap the larg- est profit per cow? Is there not some sort of a law of diminishing returns to be applied to the feeding of dairy cows?

Wisconsin. HARVEY L. BECKER, Tester.

Shotgun Alfalfa Seeding

A number of reports from farmers, particularly those located in the state of Wisconsin, indicate that there was a very considerable percentage of last year's seeding of alfalfa that had to be plowed under this spring because of the extremely poor stand. There are varying explanations of this, some of which ascribed it to a poor growing season last year that brought the alfalfa into the winter in a thin stand and a light growth. Added to this, reports indicate that ice did a considerable amount of damage in smothering out the alfalfa that remained, although this damage did not seem to show so plainly on the older seedings. One man is of the opinion that his top soil is slightly acid and that this combined with the relatively poor growing conditions last year caused the loss of his seeding. It is his opinion that in a good growing year the alfalfa is able to overcome the disadvantages of the slight acidity, as his subsoil is very rich in lime.

One peculiarity that has been noted is the fact that while a considerable percentage of the alfalfa seeded last year has killed out, last year's seeding of red and alsike clover has made an unusually heavy crop. In driving through the country we have seen fields of clover with cocks so close together that it was impossible for the wagon to pass between them.

In discussing these conditions with one of our neighbors he stated that it had been his custom for some years to seed a mixture of 8 lbs. alfalfa, 8 lbs. red clover, 6 lbs. alsike, and 4 lbs. timothy to the acre. While he says this is an expensive seeding, yet experience has shown him that where the alfalfa does not make a good catch the other grass seeds will come in and fill up those blank spaces, with final results of a heavier total yield per acre. He has also noted that where the soil conditions appear to be right for alfalfa, the alfalfa seems to have a considerable advantage in growth over the other grass seed.

We would be pleased to have the opinions and experiences of other readers as to this shotgun method of getting a stand of legume hay where alfalfa is not always a sure and certain crop.

Making Alfalfa Hay

I'm a new beginner with alfalfa and I guess I stacked it too wet. I let it stand in small cocks a week. I thought it was cured enough, but now the stack is so hot that I can't hold my hand in it and the hay is brown as tobacco. I don't suppose that hay will be worth anything. Please let me know if there should be anything done with it, or shall I leave it the way it is. What is the best way to cure alfalfa to keep it from heating and keep the green color? How long can shocks stand on the field without hurting the stand?

Winger, Minn. O. J. J.

Our usual recommendations for the making of alfalfa hay are to cut the hay in the morning after the dew has dried off and allow it to stand in the swath until it is well wilted. This permits raking up some time in the afternoon as a usual thing. If a side delivery rake is available, put the hay into windrows and allow it to stand in a windrow some twenty-four to forty-eight hours. It may be desirable to turn over this windrow some few hours before hauling in, but this is not always necessary unless the hay is very heavy. However, it is difficult to give definite instructions as to the length of time the hay should stand in the windrow because of the great variance in the drying weather that prevails. For instance, this year we had to allow our hay to stand in the windrow for five days before it got as dry as we like to have it. Ordinarily, if rain does not intervene, we will haul it to the barn within some 36 to 48 hours after it is cut.

Where the hay is put into cocks, about the same rule prevails as when put into windrows except that it is desirable to open up the cock or tip it on its side a few hours before the hay is hauled to the barn. In both cases when rain intervenes, the hay will have to stand until it has dried out again. This means, in the case of the windrow, turning it over with the rake after the top has dried out; and with the cocks, they may have to be opened up and spread out.

This does not make perfectly dry hay and it will often heat in the mow, particularly immediately under where it falls from the fork. Considerable heat may develop in the mow and the hay turn brown or dark colored. However, if this hay is fed to cows rather than sold, this is no disadvantage as the cows really like brown or dark colored hay better than the green alfalfa. If the hay turns musty as a result of having too much moisture due to rain on it, this is undesirable and depreciates the feeding value of the hay.

It has been the recommendation of some men that it is desirable to open up a stack or mow of hay that heats up badly. We question the desirability of this practice not only because of the labor involved and the fact that the heating is not likely to do any damage, but also it is our opinion that there is great danger of spontaneous combustion if the hay is loosened up so that the air can get to it. In this connection, we would suggest reading the answer to an inquiry that appears in our June 10 issue concerning spontaneous combustion.

If the hay cocks are left in the field for a considerable time, they should be moved within a week's time or less in order to keep the hay from smothering out the alfalfa plants. Personal observation as to the growth of the alfalfa will be the best guide as to when the alfalfa should be moved.

Destroying Rats

Some time ago I read of the use of cyanide potassium gas for killing rats. How is it used and where can I get it?

Barron, Wis. J. L. R.

Calcium cyanide dust is of outstanding usefulness in destroying rats. Calcium cyanide is a compound that rapidly gives off hydrocyanic gas when acted upon by the moisture in the air. This gas is extremely poisonous and in sufficient concentration is destructive to most animal life.

Calcium cyanide dust may be used to advantage in destroying rats in open burrows in fields, along ditch banks, under sidewalks, around the exterior of buildings, under pavements and tight floors, in corncribs. It is particularly suited for use on farms and poultry plants.

The dust is used most effectively by forcing it into rat burrows or other harbors by means of a portable dusting pump or duster with a flexible hose attached. The large foot pump is most satisfactory. A few strokes of the pump will fill most rat burrows with a smokelike dust, which will emerge from all connecting openings and thus indicate the extent of the system. All openings through which the dust escapes should be closed with earth, sod, or other material.

In double walls of farm buildings, lumber piles, or corncribs, where the escape of the gas can not well be prevented, it is necessary to use much more dust than in an air tight burrow. Dusting should be done on a still day, so that drafts or air currents will not quickly carry the gas away.

In dusting corncribs some of the powder should be forced into the corn about midway between the top and bottom of the crib and then should be pumped in all around near the bottom at 3 or 4 foot intervals. There is little danger attending the use of calcium cyanide dust in corn or other edible products, because the gas becomes entirely dissipated in a few hours and the residue is non-poisonous. To be entirely safe, however, the corn should not be fed for several days after dusting.

We had several spectacular demonstrations in Jefferson County last spring. At one of them we pumped the dust into holes into a stone floor of a tool shed. Some of the rats were able to get out, but were so badly poisoned that they could not get very far. We raised some of the stones in the floor, and found a goodly number of rats dead in the burrows.

Both the calcium cyanide dust and crystals and the hydrocyanide-acid gas given off by them are extremely poisonous and should be handled with the utmost care. This poison should not be used in inclosed buildings or transferred from the container to the duster indoors. Avoid breathing the gas given off, and always wash the hands after handling the poison. The dust rapidly deteriorates upon exposure to air, so that the cans should be quickly and tightly closed after removing part of the contents. Store in a safe place away from the house and out of the reach of children, irresponsible persons, and live stock.

If the local druggist or hardware dealer does not have calcium cyanide dust and the dusting pump, he should be able to secure it from his wholesaler. If not, write Hoard's Dairyman.

Wisconsin. J. M. COYNER.

Buy 6-ply tires--it pays

THE Kelly-Springfield 4-ply balloon is as good a 4-ply tire as it is possible to build today, and for city use, where road conditions are ideal, it is giving very satisfactory service on light cars.

For the kind of work, however, that a car usually gets in the country, tires of a sturdier, heavier construction are needed.

Kelly 6-ply tires are built for just this kind of service. Barring punctures, a set of Kelly 29 x 4.40 six-ply balloons on a Ford will run indefinitely.

There is real economy in paying the slight difference in cost between a 4-ply and a 6-ply tire.

"Kelly dealers everywhere—
there must be one in your town."

News from Washington, D. C

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, D. C., August 9—With the closing of the production season in the southern hemisphere and the facts of production and world trade in dairy products pretty well in hand for the year 1927, it seems apparent to the experts in the U. S. Department of Agriculture that there is a tendency in producing countries to still further increase production, while in the chief consuming or importing countries there seems to be a halting of the upward tendency and a consequent price stagnation which they are inclined to look upon with some misgiving.

Reports at hand from American observers in New Zealand indicate that there has been a good season in production, but not very satisfactory as to either British or Continental European outlet and some comparatively low prices. The Argentine production has not been as large as was anticipated. Weather conditions were not entirely satisfactory in Australia. However, both Denmark, Holland, and other north European countries seemed to be showing increases in production, while Germany, rated as an importing nation, showed a decided tendency to increase the home production of dairy products.

Weakness in both German and English markets adds to the generally depressing price situation.

Contrasted with this is the generally good demand for milk, butter, cheese, and most other dairy products in this country, little or no evidence of undue increase in production, and at this time at the end of the storage season only just about a normal amount of butter in storage. Storage stocks, while larger than a year ago, are not sufficiently larger to provide for what was a self evident shortage in storage last January and February.

Your correspondent has been making inquiry recently into the progress of work in the study and control of contagious abortion. Dr. Buck, in charge of this work, made a very teresting address on the subject the Dairy Pilgrimage in the spri He now indicates further work, pecially as to results of inoculat which indicate progress toward c trol when the animals are taken time. There is growing interest this work, evidenced by inquiries a communications which are receiv An appropriation of about $40,00 used principally to carry on the wo It is also indicated by the inquir that have been made that grea progress could be made if more c were available for investigations, Dr. Buck could have some more cl ical and junior technical assista There is some possibility of an larged project being prepared presented as a part of the next ye research program.

A survey of city and village hea ordinances to show to what extent B. testing and pasteurization are r being required has been set in mo by the Public Health Service, the reau of Animal Industry, and the reau of Dairy Industry. Special quiry will be made by agents of or the other of these federal serv in every municipality having a he ordinance and an enforcing offi The results will be summarized classified for the guidance of the partments and Congress for year's work.

The inquiry is made on blanks pared by Drs. Frank of the Pu Health Service, Mohler of the Bur of Animal Industry, and Larson the Bureau of Dairy Industry, signed to get just the specific in mation wanted, without confusin with other matters. These bla will be sent to every city and vil health officer to be filled out.

The purpose of the inquiry e cially is to assist Congress in viding funds to carry on T. B. t ing, so that the dairy industry be prepared to meet the growing mand of cities and villages for T free cattle for their milk supply.

Big Increase in Milk Production Last Year

The quantity of whole milk produced in the United States last year increased four billion pounds over 1925, according to estimates by the United States Department of Agriculture. Most of the increase was consumed as fluid milk in households, and used in the manufacture of butter and ice cream.

The Department places the quantity of whole milk used in 1926 as 120,766,487,000 pounds compared with 116,505,395,000 pounds in 1925. The quantity of this production used in the manufacturing of creamery butter was 30,487,086,000 pounds of milk compared with 28,592,046,000 pounds the preceding year; condensed and evaporated milk 4,333,760,000 pounds compared with 4,394,645,000 pounds, and ice cream 4,464,144,000 pounds compared with 4,437,524,000 pounds.

The quantity of milk used for household purposes is estimated at 56,417,000,000 pounds compared with 54,325,776,000 pounds in 1925. The increase, however, has been due entirely to the increase used by the city population, the per capita consumption being 55.3 gallons, as compared with 54.75 gallons in 1925.

Of the quantity of dairy products manufactured, the production creamery butter was 1,451,766 compared with 1,361,526,000 po the preceding year.

Cheese production is placed at 4 416,000 pounds compared with 4 514,000 pounds the preceding y condensed and evaporated milk 1,3 504,000 pounds compared with 1,7 858,000 pounds; powdered milk 0 768,000 pounds compared with 8,9 000 pounds; powdered cream 1 000 pounds compared with 33 pounds; malted milk 20,673,000 po compared with 18,050,000 po canned sterilized milk 1,28 pounds compared with 1,57 pounds; and ice cream 324,66 gallons compared with 322,72 gallons.

It is estimated that 3,941,60 pounds of whole milk were fe calves last year, compared 4,047,105,000 pounds in 1925, there was wasted some 3,622,48 pounds compared with 3,495,16 pounds in 1925.

Approximately 47 per cent of total quantity of whole milk used year was consumed as milk for h hold purposes; 25 per cent was ufactured into creamery butter per cent into farm butter, and s er percentages for the other ucts named.

A COMPACT UNIT

for Washing and Sterilizing Bottles

A REAL TIME AND LABOR SAVER

BUILD up the reputation of your product by delivering only in bottles which have been washed and sterilized in your own dairy. It pays.

And do it with the No. 9 Fort Atkinson Washer and Sterilizer shown above. Everything is handy. Without moving a step the operator stands at the machine and cleans 500 bottles or more per hour. Only one handling of each bottle. Rinsing and sterilizing practically automatic.

This is just one of the many *CP* aids to profitable dairying. We specialize in milk house equipment. Write headquarters about your problems. 320-page catalogue FREE.

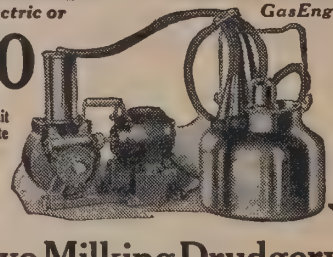
THE CREAMERY PACKAGE MFG. COMPANY
1245 W. Washington Blvd., CHICAGO, ILL.

20 POWER USES FOR Your Ford

E-Z POWER, strong and reliable, runs directly off the crank shaft. No side pull on bearings, to wear engine and tires; no holes to drill. Attach in few minutes. Many users never remove it. Doesn't affect steering. Does all the work of any separate farm engine. Portable, powerful, convenient—backed by the dependability of your Ford engine. Fits any model. No need to do without power now because of cost.

Costs One-Fifth of the Price of a Good Farm Engine. Weight 35 Pounds.

Grinds feed, churns, pumps water, saws wood—for all farm jobs. Ideal and economical combination for saving your time and money. Nothing to get out of order. Steel cut gears run in oil-tight case. **Governor regulates engine speed; will not overheat. Fits Any Ford.**



FREE Send name today for free literature on this latest, guaranteed improved power unit of all work. Try it 10 days on your Ford

Wayside Musings On Friendship

JOSEPH S. MORRIS, WISCONSIN

THERE is a large place for friendship in the life of the world. Friendship has a work to do and a work that is of the utmost importance. We may be friendly to a person or to a cause and that may mean only that we are not hostile to the person or to the cause. Friendship cannot be considered so negative a thing as that. True friendship is built upon mutual possession of right principles, virtuous character, and true life. Said Jesus, "Except two be agreed how can they walk together."

In our ordinary, everyday life, how much we gain from true friendship; in the give and take, in the exchange of ideas, in the mutual self-sacrificing helpfulness, in the mutual concern for each other's welfare, in speaking well of each other. It is a most comfortable and happy feeling to know that there is one upon whom we may depend at all times.

Love does not always depend upon common ideas and ideals. It is possible to love even when there are many things in the object of our affection of which we do not approve. But friendship must have as its foundation common likes, common hopes and aims, common tastes, common integrity, and open-mindedness.

And there is a wonderful law of growth in friendship. As we live and learn, think and work, build our philosophy of life, we are weaving the pattern out of our own experience and out of the free-flowing intercourse of friendship.

The general idea of friendship is a poor apology for the real thing. Much that is called friendship is mere acquaintanceship.

In friendship there must be the utmost of freedom. A friend of mine failed to keep an appointment with me and on my reproving him for his apparent neglect he countered by saying, "I did not think it necessary to explain myself to so good a friend." That is just it. True friendship must think the best at all times, put the most generous and charitable construction upon actions; in a word, trust to the very end.

In the 14th and 15th centuries in Germany there was a band of mystics who called themselves the Friends of God. They had banded themselves together to seek a more vital religion, a religion based upon abiding trust in God and a constant intercourse so that the life of the lesser might be heightened and made effective by life of the greater.

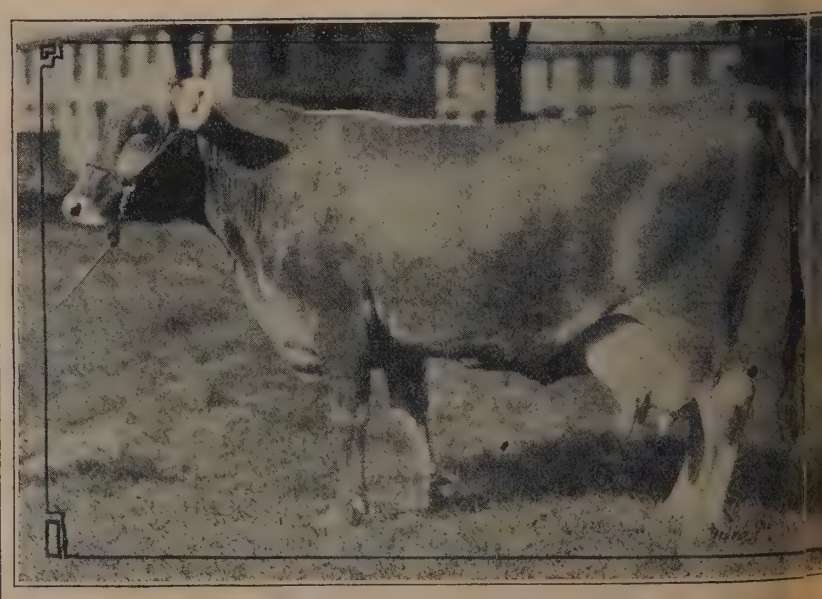
One of the most beautiful pic of friendship is that of Jesus sa to His followers ". . . but I called you friends; for all things I have heard from my Father I made known unto you." He ha "shut them out." He was no l calling for blind and unquesti following. He had taken the once into his innermost heart.

Men are made by the high e iences in which they strike ha hand and pledge undying dev or by the unexpressed but mut understood compacts of loyalty.

In our human institutions the those who take lightly their pl of friendship and devotion. W annoyed by them, and yet, is i true that they get just so mu they give and no more? Can w pect large loyalty to friendship people who live small mental spiritual lives?

I like the story of the litt whom a wealthy and cultured was arranging to adopt from phan asylum. The lady told the girl of all the wonderful thing intended doing to make her and was dumbfounded when the girl expressed uncertainty abo ing with her. Pressed for her r she said, "But what am I goi give for all this that you are me?" She was right. True f ship in her new home could only from the contribution each w make and the wise lady said, pect you to love me in return f love to you; that will be my re

Friendship may be found where. Life-long friendships grown up between neighboring ers, between men and women ing next to each other in fac between men and women enga office work, between men and in the professions, between m women in social life.



Friendship is a flower tha grow anywhere, given the s common tastes, common hopes, al sacrifices and helpfulness, trust and faith.

You may have many friends is quite likely that you will ha one abiding and undying frien

---

Dickey: "My dad is an Elk, a Moose, and an Eagle."

Mickey: "Gee, what does it see him?"

GOOD FAITH, A SWISS RECORD BREAKER

Good Faith, a 5-year-old cow owned by the University of Wisconsin, has just finish 10 months' record of 15,831.9 lbs. milk, 703.36 lbs. fat which entitles her to first place in her class. She was bred by B. H. Hibbard of Wisconsin.

They don't *come* any better

I DIDN'T know it, but Prince Albert was just the tobacco I had been looking for all the time. I hate to think of the time we lost getting together. But let that go. We're all set now—me and the pipe and P. A. We've been pals from the very first puff.

I had a hunch I was going to like P. A. the minute I got that breath of Nature's noblest gift to pipe-smokers. What a treat! It made me think of a hike through the woods, when the trees and the vines are in full leaf. I found the taste "as advertised" by the aroma.

Cool as a customs-inspector. Sweet as the thought you have nothing to hide. Mild as a milk-shake, yet with that full-bodied flavor that satisfies your smoke-taste right down to the ground. That's Prince Albert, Fellows. They don't *come* any better.

No matter how set you appear to be on a smoke-program, try P. A. I give you my word, no other tobacco that ever came down the pike ever brought so much downright satisfaction out of a pipe. "That fellow knew his groceries," you'll say, or words to that effect.

P. A. is sold everywhere in tidy red tins, pound and half-pound tin humidors, and pound crystal-glass humidors with sponge-moistener top. And always with every bit of bite and parch removed by the Prince Albert process.

PRINCE ALBERT

—the national joy smoke!

Genuine Cork Linoleum Rugs in NEW–DIFFERENT–PRETTIER *Patterns*

Why not brighten the kitchen with a touch of color?

NOTHING would be more suitable for the kitchen (that most lived-in-room in the house) than this lovely rug of Armstrong's Linoleum in the green-and-white tile pattern. Colorful, simple in design, clean looking, it is far prettier than that old wood floor, and much easier to keep clean! Just a light mopping keeps it bright, shiny, and new-looking.

Resilient, quiet to the tread and *tough*, it will give years of wear. It is so flexible and pliant, too, that it can easily be rolled up and moved from room to room. Yet an Armstrong's Linoleum Rug costs little—the price is now amazingly low, lower than it ever has been.

Besides the tile pattern illustrated for the kitchen, there are 19 new patterns of Armstrong's Linoleum Rugs now being shown in the stores. These new rugs are more than merely new designs. They are really new creations in beauty and coloring. Rugs of genuine Jaspé linoleum with an overlaid border, rugs with a single all-over design without repetition, patterns you must see to realize fully their unusual attractiveness.

In the main illustration:
Pattern No. 867
Above: *Armstrong's Jaspé Linoleum Rug, Pattern No. 727*
Right: *Pattern No. 960*

Now, with these new Armstrong Rug patterns, you can have the beauty of design and charm of color together with the practical advantages of a smooth-surface rug. . . . Not only in the kitchen, but the best rooms in the house—living-room, dining-room, bedroom. Many of these new patterns are made in the extra-large sizes, 12 ft. by 12 ft., and 12 ft. by 15 ft., as well as the usual smaller room sizes.

SEND FOR THIS FREE BOOKLET

"Rugs of Practical Beauty" shows a charming array of these new Armstrong Linoleum Rugs in full color. You will enjoy making your selection before you go to the store. There is no charge, simply write for this booklet to the Armstrong Cork Company, Linoleum Division, 1018 Jackson Street, Lancaster, Penna.

Worth-while Books

I don't believe that ever a month sses that I don't hear someone shing that she knew the worth- ile books either for herself or for r children to read, and never such time goes by that I do not wish that night broadcast to all farm families e rich possibilities that exist in any states for such reading. The ght of fine private libraries owned people who have no real interest books and the terrible book-hunger at exists in so many people who are ancially unable to own books, akes me think sometimes that hings just ain't right, someway" as e old lady said in the story.

My attention has been called again a little pamphlet entitled 100 orth-While Books, gotten out a few ars ago by a committee of 96 edu- ted men and women and containing les of 100 books they thought ery person between the ages of 20 d 45 ought to read. The list is aded by the wise caution, "Better ad the best books first or you may t have time to read them at all" d the list is arranged in the order of e popularity of the books with the mmittee. You would guess, then, at early in the selection are such oks as David Copperfield, Ivanhoe, e Scarlet Letter, Franklin's Auto- graphy, Treasure Island, and other ch standbys dear to the heart of ery generation, tapering off at the d—I do not mean to be uncompli- entary to these books—to the ones at were most contested by the com- ttee.

The books on this list are more or s the standard classics and not the est books. If you happen to live the state of Wisconsin you can get t only this list of books but the oks themselves and also your oice of the very best in the late itings—all free of charge—by iting to the Wisconsin Library mmission, Traveling Library De- rtment, Madison, Wisconsin. When ay "free of charge" I mean it al- st literally because the only thing u have to pay is the postage one y which is very trifling. The time it is three weeks but there is no it set to the number of books that y be borrowed as the librarians e always interested and obliging d try to be as generous as their oplies will permit. The librarian l select books for you in case u don't know exactly what you nt but you must write as nearly possible what your tastes are.

There is nothing like a good book take you away from your worries d problems and I sometimes think at the parent who teaches a child love reading has done more to pro- ie insurance against loneliness and happiness than he could have done y other way.

If you are a book-lover, craving re good reading than you have ney to buy, and if you don't know ether or not your state has a free n library, write in to someone at r state capital and inquire. If you 't think of anyone else to inquire of, a note to the governor's office will give you the desired information.

"There is no vessel like a book to take us lands away."—LUCY THOMPSON.

Can a Girl Work Her Way Through College?

Time was when a girl who longed to go to college and didn't have the money simply stayed at home and pined the rest of her life because of lost opportunities. Now such an idea, if she has health, never occurs to her for she has too many examples of successful women who have made their way by the sweat of their brows—or brains. Both ways have been done so many times that books and books could be filled with the stories.

My life for some time near a large university acquainted me with some of the possibilities girls have for "earning while learning," as the advertisements say, and the thing I found most to criticize about girls who were doing this was that they drove themselves too hard. Any girl who plans to make her own way should allow herself more time than the regular four years for getting through. It is not fair to her health for her to support herself and at the same time do as much scholastic work as girls are doing who get full maintenance from home. It is pretty hard to make the 18-year-old believe that she will ever be other than perfectly well and strong and this is especially true of girls who have the ambition to try to work their way through college.

Such girls as this ought to start college with at least enough money to last them half a year while they are getting acquainted with their situation.

Now what do these self-supporting girls do? Literally everything. Only the other day one of them advertised as a bridge player. She plays a good game and she has decided that she will get fun as well as pay out of it. Typing, cleaning, selling things (Christmas cards, magazine subscriptions, extracts), helping in stores, tutoring, caring for children, mending, helping serve at parties, answering telephones, acting as office assistant. A girl who has a special subject in which she is interested such as botany, bacteriology, or history can often after a year's study be taken on as office or laboratory assistant. This kind of work is greatly to her advantage as she is learning more intensively about her specialty than if she were doing other work.

The larger the college the greater the number of opportunities for work. Many of these maintain self-help houses where girls can make most of their expenses by doing part of the housework and some of the finest friendships I know have been built up in these student homes.

A girl arranging to work through all or part of her course should immediately on arriving at college get in touch with the person in charge of the employment bureau for she will be the one who, most of all, can make the earning of college money easier.—LUCY THOMPSON.

Open-face Sandwiches

Next time you are having a children's party with sandwiches, try the open-face variety if you don't mind doing a little more work. My favorite of this kind is made with white bread, cut thin, spread with butter and then cream cheese, and then decorated with thin slices of stuffed olives. The bread may be cut in rounds, or squares, or triangles and the butter and cheese must be creamed very soft so that spreading them will not tear the bread. The olive slices may be arranged in many ways that will interest the children—squares, circles, triangles, or even eyes, nose, and mouth to make a face.

A sandwich that is a pretty addition to a yellow and white color scheme is made with hard-cooked egg. Spread rounds of white bread and butter; around the edges make a ring of egg yolks which have been mashed and seasoned with salt, pepper, and vinegar and in the middle put the egg whites which have been chopped fine and seasoned.

For the sweet sandwiches so dear to a child's heart, use brown bread baked in baking powder or other round tins. Slice thin, spread with butter, and over this spread a thin layer of marmalade; or you could make designs on these by using thin rings of candied or maraschino cherries.

Bread that is a day old is best for all these sandwiches.—LUCY THOMPSON.

Stork Shower

Ask a group of friends or the members of a club to come and bring a gift for the prospective baby. A new game to play is called, "Radiographs," or Choosing the Baby. Cut from old magazines pictures of a baby, a mother and baby, whole family, etc., and arrange on numbered cards with a comment written on each. Pass to the guests and let each guess which is the one chosen as it (baby). After seeing the baby of course you will want to help name it. For naming the baby write the mother's full name on paper and give to each person with a pencil. Each guest is to write as many boy and girl names out of those letters as they can in ten minutes. The one having the most gets a prize.

A child's wagon can be made into a float by covering with white crepe paper and trimmed with bows of blue ribbon. A small child dressed in white and blue may pull it in loaded with the gifts for baby and mother. The mother opens them for all to see. After this refreshments may be served.—E. M. CHAPMAN.

Good for Something

Tommy: I want another box of those pills I got for mother yesterday.

Druggist: Did your mother say they were good?

Tommy: No; but they fit my air-rifle.—Good Hardware.

Send for Our Fall Fashion Magazine

You simply must have a copy of our Fall Fashion Magazine, for it contains too many good things for you to miss. All the new fall and early winter styles of course, and then there are pages of novelties for the masquerade. Articles about health and beauty and reducing safely, and pages showing correct hats, fancy needle work, special lingerie, etc.

While you have the matter in mind send 10c for your copy to our Fashion Department, Ft. Atkinson, Wis.

*Unsalted.

Wisconsin July Butter

Wisconsin co-operative creameries paid producers a net price of 45.2 cents a pound for butterfat in July according to reports from 77 of these creameries to the Wisconsin Department of Markets. These creameries received an average of 40.4 cents a pound for butter, making spread of 4.8 cents between the price received for butter and the price paid for fat.

The range in prices paid for fat was from 40.3 to 48 cents, with the price received for butter ranging from 39.5 to 41.1 cents. The overrun ranged from 21 to 25.6 per cent. Receipts of butterfat averaged 46,424 lbs. per creamery.

June Dry Milk

(From Report by U. S. Department of Agr.)

The wholesale prices given below are based on reports from manufacturers governing actual sales F. O. B. factory during June:

Dry Skimmilk: Prices ranged from 7 cents to 12 cents for dry skimmilk in bulk, averaging 9.11 cents a pound for sales, totaling 7,428,590 lbs. When packed in one-pound cans the price reported was 32.1 cents a pound.

Dry Whole Milk: Prices ranged from 22.5 cents to 28.5 cents for dry whole milk, averaging 27.10 cents for sales totaling 195,838 lbs. When packed in one-pound cans the price reported was 47 cents a pound.

Dry Buttermilk: Prices ranged from 6.5 cents to 10.5 cents for dry buttermilk in bulk, averaging 8.47 cents a pound for sales totaling 2,352,736 lbs. When packed in one-pound cans the price reported was 10.75 cents a pound.

Feed Market Situation

(By the Grain, Hay and Feed Market News Service, U. S. Bureau of Agricultural Economics.)

Moderate offerings of most by-product feeds were being readily absorbed at steady prices at the close of the first week of August. The strength imparted by a sharp advance in grain prices was being somewhat offset by favorable pasturage conditions which tended to reduce the demand, particularly from consuming channels.

Wheat feeds remain generally firm. Production as indicated by output of flour at important milling centers has shown some increase during the past few weeks but it was still smaller than for the corresponding period in the past three years. Demand for bran continues rather dull. Eastern resellers and some mills have been offering bran in eastern markets below quotations from southwestern mills where production has been restricted by the small demand for flour. Offerings of bran for August, September, and October shipment by southwestern mills were at prices about a dollar below spot prices but were not finding an active demand. The recent advance in wheat prices caused by unfavorable crop developments in the spring wheat areas both in the United States and Canada are likely to have a strengthening influence on the market for wheat feeds, particularly if the demand is broadened.

Linseed meal has averaged barely steady with only a limited volume of trade. Prices at Minneapolis have declined slightly during the past few weeks but have held fairly steady at Buffalo. Production has continued light and the output has been readily absorbed so that holdings of meal at the present time are seasonably small. Production of meal for the whole season seems likely to be nearly as large as last year's production, which approximated 40,000,000 tons.

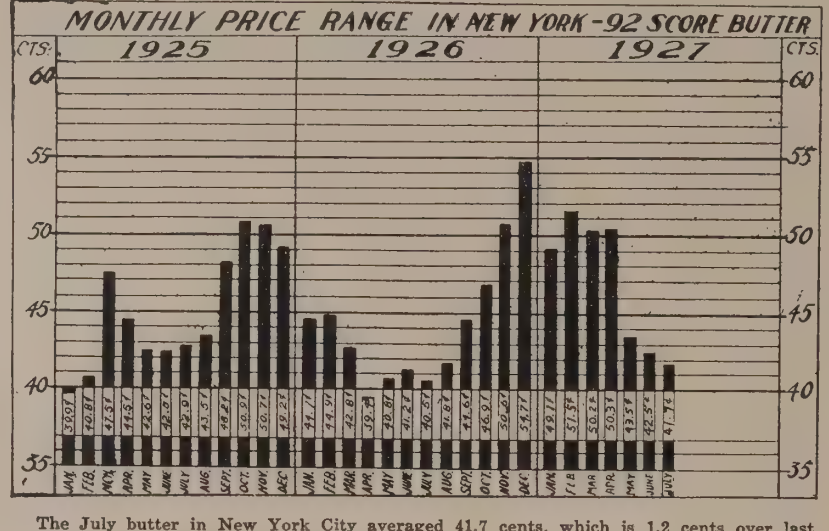
Cottonseed meal: A cotton crop of about 13,500,000 bales was indicated from the condition and acreage report at the first of August. This is about 4,500,000 bales smaller than last year's production and slightly smaller than the 1924 crop, from which about 2,125,000 tons of meal and cake were produced compared with 2,800,000 tons produced to the first of July from last year's crop. It seems probable, therefore, the supply of cottonseed meal this season will be around 675,000—700,000 tons below last year's production.

Gluten feed: The advance in corn prices has been a strengthening factor in the market for corn feeds and prices have held very steady. Production of gluten feed during July fell about 600,000 tons short of the June production but was about 500,000 tons larger than for the corresponding time last year. Resellers at Buffalo and other eastern markets have recently been offering gluten feed at about 50c per ton below manufacturers' quotations. Manufacturers' offerings have kept well sold up but recently some feed for August shipment has been offered from Chicago at around $42.60 per ton.

Alfalfa meal continues to rule steady to firm. Inquiry continued light in the Southwest and some mills are still closed. Mixed feed manufacturers are buying a moderate quantity and prices are holding about unchanged.

The demand for tankage has continued active and prices are holding firm at $70 per ton at the principal markets. Some points report supplies hardly equal to current inquiries.

Quoted August 9



Standard spring wheat bran: $25.50 at Minneapolis, $29.50 at Buffalo, $32.75 at Philadelphia, $28.25 at Chicago. Hard winter wheat bran: $24.50 Omaha, $25.50 Kansas City. Soft winter wheat bran: $31 Cincinnati, $27.50 St. Louis.

Standard wheat middlings: $37.50 Buffalo, $40 Philadelphia, $36 Chicago, and $33 Minneapolis. Soft wheat middlings: $41 Cincinnati, $38 St. Louis. Gray shorts: $36.50 Omaha, $36.50 Kansas City.

Cottonseed meal (43%): $43.50 Philadelphia, $41 Chicago, $40.10 Kansas City, $32.50 Fort Worth.

Linseed meal (34%): $46.50 Buffalo, $46 Chicago, $45.50 Minneapolis.

Gluten feed: $36 Buffalo. White hominy feed: $39 Buffalo, $38 Chicago. Alfalfa meal: $26 Chicago, $22.50 Omaha, $22 Kansas City, and $25 St. Louis.

The July butter in New York City averaged 41.7 cents, which is 1.2 cents over last year and 1.2 cents less than two years ago.

July Cheese

Wholesale price of cheese on the Wisconsin boards averaged 22.4 cents for July, which is practically the same price as prevailed last month but exceeds a year ago by 2.6 cents. The first ten days in August saw an increase in price of 1.1 cents, with the markets erally firm.

Cheese production for the first six m of the year totaled 203,822,000 lbs., a dec of twenty-two million pounds from last Net imports were 37,934,000 lbs., an inc of eleven million over last year. Storag July 1 was 49,643,000 lbs., a decrease of million pounds from last year. This l the total estimated trade output for thes months to 245,863,000 lbs., a decrease o per cent in apparent consumption of chee compared with the same period last year.

Daily quotation from the U. S. Depart of Agriculture shows the following av wholesale prices for American cheese o Wisconsin Primary Market during July:

	July 1927	June 1927
	cents	cents
Twins	22.	22.2
Single Daisies	22.4	22.5
Longhorns	22.3	22.3
Square Prints	23.9	22.8
*Receipts since Jan. 1st	120,178	96,958 1
*Receipts for month	23,221	20,765
*Storage (End of month)	14,374	10,995

*In thousands of pounds at Chicago, York, Boston, and Philadelphia (i. e. omitted.)

Wisconsin July Condens Prices

Forty-nine condenseries reported to Wisconsin Department of Markets the paid in July per hundred pounds mil livered at their factories. Reduced to a mon 3.5 per cent test basis, these ranged from $1.85 to $2.50, the average $1.95.

Seventeen factories sent delayed report June, the average being $2.02. This is cents above the previously reported avera $1.95 for 42 factories.

July Butter

Butter averaged 41.7 cents in New Yo July, a decline of .8 of a cent from the average but still 1.2 cents above July a ago. The first ten days of August sa average decline of 1.2 cents but the m continued firm.

Creamery butter production for the fir months of the year was 766,955,000 lb increase of seven million pounds over year. Net imports for the same period 4,189,000 lbs., an increase of three m pounds over last year. Storage holdin July 1 were 90,116,000 lbs., an increase o million pounds over a year ago. This l the estimated trade output for the firs months to 1,013,937,000 lbs., a decrea nineteen and a half million pounds or 1 cent less consumption than for a like last year.

Daily quotations from the U. S. Depar of Agriculture show the following a wholesale prices on 92-score butter (e at four of the principal markets, together receipts and storages:

	July 1927	June 1927
	cents	cents
Chicago	40.	40.4
New York	41.7	42.5
Boston	41.8	42.6
Philadelphia	42.6	43.2
*Receipts for month	68,645	74,223
*Receipts since Jan. 1	370,189	301,544
*Storage (End of month)	66,783	41,026

*In thousands of pounds at the four m (i. e.—000 omitted). Ninety score butt eraged 38.2 cents for July in Chicago, centralized butter at this market sellin 39.4 cents. Jobbers' prices on extras s retailers averaged 42.5 cents in Chica spread of 2.5 cents above wholesale.

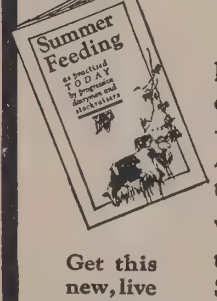
Philadelphia Milk Price

The Inter-State Milk Producers' Assoc announces that the August basic pric milk will be $3.29 F. O. B. Philadelphi $2.71 per hundred at receiving stations i 60 mile zone.

The July surplus price was $2.16 F. Philadelphia. The July surplus prices receiving stations on railroad were $1.5

These are based on milk testing 3 pe butterfat with a differential of 2 cent each half point of test up and down.

Wisconsin Milk Price



The average farm price of milk for W consin has been steadily increasing durin first half of 1927. The June price ave $1.96 which is 22 cents above last yea 14 cents above 1925. It is the highest price since 1920.

The following table has been prepar Mr. Ebling, agricultural statistician fo Wisconsin Department of Agriculture, ing the average farm price of 100 l

What's the Big Secret of Fall Milk Production?

Read this Free Booklet and FIND OUT!

Every year swells the ranks of successful dairymen who feed a summer grain ration — almost always including Linseed Meal. And each year they make more money than neighbors who trust pasture alone.

Why? Because a cow isn't just a machine to turn today's feed into tomorrow's milk. She's a living, breathing animal—capable of storing up health and energy cheaply in summer, and giving it back to you in profits weeks afterwards.

Look beyond summer milk checks. Build up your herd by grain feeding. Swing into fall with everything set for continued production. Write today for new booklet including practical summer rations.

Get this new, live story on Summer Feeding. Mail the coupon NOW!

What is the COST of painting with Eagle?

HE cost of painting is determined by the cost of materials, the cost of labor.

the big cities a paint job is 70% r cost and only 30% material. In rural communities labor s are a little lower but labor ywhere is so high that you can afford anything but the highest lity of paint materials. It re- es less labor to apply high qual- paint because it covers well; it hes out easily and can be spread a greater area. thus reducing ost per square foot.

he principal reason for the econ- of Eagle Pure White Lead is ng wearing quality—made pos- by the tough elastic strength of lead in oil—a strength which ther material seems to possess mpletely.

nd Eagle is inexpensive in first One hundred pounds makes oximately seven gallons of pure paint.

k any good painter his opinion gle Pure White Lead—in use 1843. *The Eagle-Picher Lead pany, 134 North La Salle t, Chicago, Illinois.*

Seasonable Live Stock Notes

County, district, and state fairs are in full swing. We hope every subscriber of Hoard's Dairyman may find time and be moved to visit a fair. We often wonder on what level of improvement live stock production would be today if we had never had any fairs. This thought leads us to believe they have had an important influence in live stock improvement. Of late years junior club work in live stock projects has had a big influence on fair attendance and, we believe, on live stock improvement. Certainly it has given thousands of farm boys and girls worthwhile things to do. What is a well managed fair? To us it is the show window of the area it represents where the best products of the field and factory are brought together for inspection and comparison. A fair affords great opportunity to parade the pride of those who participate and to encourage those who look on. Fair officials are anxious to serve and please their patrons. In visiting fairs this year we suggest that those who attend look for both good and bad features and lay their commendations and criticisms before the boards of directors. Is the live stock program of your fair all that it should be? If not, what can be done to improve it?

Feed Dry Cows Enough

September finds a good many dry cows in the dairy sections where fall calving is a common practice. Our correspondence indicates that the feeding arrangement of dry cows is a live subject with a good many cow owners. The tendency is to let such cows shift for themselves more or less after they have ceased to line up in the barn for the regular milking. Everyone wants his cows to produce a unit of milk at the lowest cost of feed and in the absence of a daily contribution of milk from dry cows owners are tempted to cut down on feed, thinking that by so doing they lower the cost of producing 100 lbs. of milk. If the influence of restricted feeding during the dry period on the production of the succeeding lactation is properly measured it is likely feed costs will be greater per unit of milk produced rather than lower. Dairy cows should have six weeks or more of rest between each lactation during which time they should be fed in such a way as to bring them up to good condition by calving time.

Dairy Heifers Need More Than Poor Pasture

A well known authority on feeding live stock states that after dairy heifers are eight months of age it is an easy task to rear them to their first lactation period. He states that heifers on good pasture need no additional feed to make normal growth. Emphasis is laid on "good," however, in indicating the kind of pasture needed for such growth. Heifers are more apt to suffer from neglect in summer than in winter because they start out on good pasture and frequently run into very poor pasture just about this time, if not sooner. We suggest that definite observation be made at this time of the heifers in the herd to determine how they have come through the poor part of the pasture season and whether they need more feed.

Hogging Down Corn

September is the month when those who practice harvesting corn with hogs hope to get some shotes into the fields. Some farmers who push pigs for the late October market make a practice of planting a limited acreage of ninety-day corn and thus be assured of the advantages of this method of cashing the crop shortly after it is harvested. The popularity of hogging down corn has not reached the dairy farmer, perhaps, to the same extent that it prevails on corn and hog farms. This is only natural, however, because of the difference in the number of hogs raised and of the limited amount of corn available on dairy farms for feeding swine. With all of that, hogging down corn has proved to be an efficient and economical method of getting corn out of the field. With skimmilk available on many dairy farms, a small field of early corn can be converted into live hog in a manner surprising to the man who has never tried it If skimmilk is not available, tankage is the next best protein supplement. A good pasture makes the corn and supplement go farther.

Keep the Best Hens

The last of August finds most of the hens on a vacation so far as production of eggs is concerned. Low producing hens have quit, some of them long enough to now be in the molt. The best producing hens have faded the yellow color of their shanks to a pale white and their feathers are reminders of shop worn goods. The full case of eggs every week of early spring has now shrunk to a few dozen. What can be done and what should be done now to promote the efficiency of production when the season is right again? First and by all means take out the culls—sell them; second, sell all hens that have completed two laying seasons. It will not pay to hold them over for the eggs produced in the third laying season.

None!
No Long Tubes No Claws
The Surge Milker

You will NEVER know how *easy* a milker can be to wash UNTIL you have washed The Surge Milker. No Long Tubes! No Claws!

Ever try to wash a mess of long tubes and twisted claws? Try it once . . . . then try The Surge and *see how much easier it is! Another thing!* Long tubes and claws with their cracks, crevices, twists and turns are bacteria breeding grounds. The Surge has NO long tubes! NO claws! That's WHY Surge Owners find it so *easy* to produce clean low bacteria count milk and get premium prices.

6 Milkings FREE!

Right in Your Own Barn—With No Obligation to Buy

Don't buy ANY milker UNTIL you have tried The Surge Milker with its wonderful NEW method that milks cows like no other machine has ever milked cows before. Our liberal "6 Milkings Free" Offer lets you see for yourself just what The Surge will do for you—and there is no obligation to buy unless you want to. Once you see it milk your cows—even "that cow" you think can't be milked by machine—once you see how easy it is to operate and how much EASIER it is to clean—*you won't be satisfied until you own one!*

Mail coupon now for special price, Free Demonstration and Easy Terms Offer. Learn what this wonder milker will do for YOU!

Easy Terms
You can buy a Surge Milker on very easy terms. We'll figure to use any equipment you may have already in your barn. You'll be surprised how little it'll amount to. Mail coupon now. It doesn't obligate you.

Mail Coupon for Free Book

We have just issued a NEW Surge Catalog that tells you MORE about milking and milking machines than anything you've ever read. It's a very valuable book for any farmer milking cows to have. This coupon will bring it to you—FREE.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Local Club Leaders Organize

PIERCE County, Wisconsin, has organized a 4-H club leaders' association which has been so successful in helping club work, increasing enrollment, and stimulating local leadership that the nearby counties of St. Croix, Wisconsin, and Goodhue, Minnesota, have sent club delegates to attend meetings of this association and bring back its plan of operation and organization.

Last winter this Pierce County plan was given by County Agent H. G. Seyforth to club workers from all over Wisconsin at the annual state farmers' and homemakers' conference in Madison.

"No leader, no club" is the slogan adopted in Pierce County. The result is that today they have twenty-four clubs going strong. The first leaders' school held in May, 1926, was attended by fifteen local leaders. They elected officers and decided to hold regular meetings on the second Saturday of each month at the court house.

The meetings start at two o'clock. Following the business session a question box is opened and the leaders have opportunity to solve their problems with the help of the county agent. Group singing is led by one of the club leaders.

This year the health H has been stressed and health exercises have become a part of the meetings. A new feature is the reading of a book, a portion at each meeting. They have started "Training the Child" by Angelo Patri. At each meeting three leaders put on something for the benefit of the others. Committees are appointed for such events as the annual picnic, achievement day, and the county fair.

Mileage money for each leader attending the monthly meetings at the rate of five cents a mile was obtained when members of the organization presented their case to the county board. At each meeting each leader present is required to sign a blank form. Mileage money for the previous meeting attended is given out at every meeting.

Officers of the Pierce County Club Leaders' Association for 1927 are: Mrs. A. E. Schnase, president; Mrs. Gertrude Flueger, vice-president; Miss Isora Oellrich, secretary-treasurer; and Mrs. A. L. Leonard, reporter.

In 1920, H. G. Seyforth became Pierce County's first county agent. He began club work in 1921 with an enrollment of 75. In 1927 there are some 520 club members enrolled. Mr. Seyforth has worked chiefly through the rural school in organizing clubs. Pierce County has 3,200 farmers and is distinctly an agricultural county, there being no manufacturing and no cities over 3,000.

COUNTY CLUB LEADERSHIP SCHOOL AT ELLSWORTH, WIS., APRIL, 1927
Farm women, a cow tester, an editor's wife, teachers, and advanced club members are now leading clubs in Pierce County.

THE 4-H CLUB BUILDING ON THE PIERCE COUNTY FAIRGROUND

Every club must hold at least six meetings annually. Club members are limited to three projects each. The sewing project is the most popular with 142 enrolled. The dairy calf project comes next with 100. Other projects in the order of their popularity are: poultry, canning, garden, baking, corn, pig, potato, forestry, lamb, baby beef, and apple.

Every boy and girl doing club work in Pierce County is card cataloged. Mr. Seyforth has a complete record for every member who has finished a project year since club work was first organized in the county. Two files are kept, one is an annual file in which each club member has a card with the record of his projects for the current year. The other file is composed of larger sized cards containing a complete record of each club member for every year he has been in club work. There is also information about what club members do after they finish club work.

Each club is provided with a uniform secretary's book especially prepared by County Agents Seyforth, and Lyken of St. Croix County. A carbon copy is made of every meeting report and filed with the county agent. Nearly every club has stationery with its own letterhead printed in green with the club emblem, the four-leaf clover.

Since 1923 the Pierce County Bankers' Association has appropriated annually two $25 scholarships to the club short course at the College of Agriculture, one for a boy and one for a girl, also $25 for achievement pins which includes a pin for every leader—bronze for the first year, silver the second, and gold the third. In 1927, the Bankers' Association appropriated an additional $25 toward the expenses of George Aadahlen, Pierce County club member-leader, who attended the National Club Encampment at Washington, D. C., as one of four delegates from Wisconsin. Every club in the county contributed from three to five dollars toward his expenses.

A fine $2,000 club building houses all 4-H exhibits at the Pierce County Fair. The annual Pierce County club picnic is held in June at the fair grounds. Each club member contributes ten cents toward the premiums and expenses. A song and yell

here is the Hind-Clark Dairy? t fifteen minutes ride from Hon- takes you to this beautiful cer- dairy farm with the Pacific in and the Koolau range of moun- behind. (See page 758.)

w are the crops raised? On ted land. Ten or eleven crops falfa are cut a year. Sorghum s 18 feet high and yields from 25 tons of silage to the acre.

w many cows are kept? About -some 200 being milked at the nt time. Of the 200 about 150 are Guernseys and there are 50 Holsteins.

ere is the milking done? The are kept outdoors all the time t when being washed and d. After being thoroughly ed and washed the cows are ad- l to the milking stable in relays elve.

at did Professor Haecker say dual-purpose cows in 1894? lvocated the single purpose cow he dairy after observing that bred cows did good service over ger period than did beef bred and that they produced butter economically. (See page 760.)

at is Bordeaux mixture? It is dard fungicide for the preven- f many plant diseases such as blight, grape black rot, and w. It also repels flea beetles af hoppers. (See page 767.)

w can goiter in calves be pre- l? By feeding potassium iodide gnant cows. Feed one table- ful daily sprinkled on the feed h cow of a solution made by ing one ounce of potassium in one gallon of water. (See 77.)

at is a good louse treatment for y? Sodium fluoride. It can be s a dip in the warm weather; ound to 16 gallons of water is n for about 200 hens. In colder er the powder may be mixed 0 with unsalted lard or vaseline pplied below the vent. (See 82.)

Junior Letters

A Poem From Kentucky

's Dairyman Juniors:—The following m I have written and maybe you will it:

I just was a little man,
ted out to be a dairyman
rom that day until this
s very few days that I have missed.
s more when you start to breed.
s breed for the best
hen you know you make the test.
your milk scales in your barn,
will do you little harm.
your feed and test your milk,
me it takes you will not miss.
es money to breed and feed
hat's why milk scales we all need.

dress is R. 2, Clinton, Kentucky.
W. E. Green.

Popcorn in Petland

y we made some popcorn, we watched kernels grow
tle hard and shiny things to puffs of .
it rained, and then it colder grew,
rain turned to fluffy flakes and flew
danced and flew.
other Rover who was watching them .
Mother, I think the rain has popped."

dress is Whitewater, Wisconsin.
Alan R. Cooper.

A Big Dairy Calf Club

s Dairyman Juniors:—In Freeborn ve have a wonderful boys' and girls' e have 307 members of which 101 calf boys and girls. Each township meetings and has a president, sec- nd other officers. Our club has the nembership, forty-two.

the end of July we have a joint all the clubs. Each club has a five- tunt and races and other events take ring the day. At the close of the l scores are added up and the club having the most gets a prize and much honor. Our club won last year. I will be glad to answer letters from other Juniors. My address is Albert Lea, Minnesota.

Catherine Head.

From a South African Junior

Hoard's Dairyman Juniors:—I received my badge, button, and creed yesterday and they are really very nice. It encourages one to take a great interest in club work I think.

I shall tell you how I managed to get a calf for myself. One day a neighboring farmer came up to see us. I had often intended asking him what would be his price for a good calf. As I was going to ask, a young puppy came along and started to make friends with him. The farmer took a great liking to the puppy and said it was just the kind of a dog he wanted. So I told him he could have

PEARL SHEGOG'S CALF, CENTER, WAS A PRIZE WINNER AT THE SHOW

it as we were trying to find a home for it; so he decided to take it and told me he would give me a calf for it.

One day, about two weeks after the promise was made, my calf arrived quite unexpectedly. I was glad to see it and tried to make it quite at home by giving it some barley. Her former owner named her "Chelsea Pearl" and now she answers to that name.

My work on the farm is rearing the calves, seeing to the cow feeding and cooling the milk. We sell our milk wholesale; for 7 months of the year we get one shilling three pence (about 30c) a gallon and for 5 months, one shilling four pence (about 32c) a gallon. Milk is sold in the town (bottled and everything) the cheapest for 3½d a pint. Milk is the cheapest thing in South Africa.

As soon as the weather gets hot out here the cows are always down in their milkings. Our cattle here always seem to milk better during winter than they do in summer. We feed brewers grains (dried) and oat bran as concentrates and roughages, mealies and lucerne, and rye when there are not any mealies.

I shall look forward to letters from a few members. My address is Theescombe, Box 382, Port Elizabeth, South Africa.

Pearl Shegog.

To the Holstein

Hoard's Dairyman Juniors:—I am eight years old and in the third grade. My birthday is the 26th of October. My father gave me a good cow. She now has two calves. They are pure-breds and from a good breeding. My father has about 20 head of Holstein cows.

I love the Holstein cow,
All shiny black and white,
When standing in the meadow,
She is a pretty sight.

I love to drink her milk,
All foamy white and warm,
And if I drink enough of it,
'Twill keep me from all harm.

I love to read Hoard's Dairyman,
Both its letters and its jokes.
We never know just what good news
It will bring to all the folks.

My address is Mendon, Utah.

Cleo Richards.

Hoard's Dairyman Juniors:—I am in the Washington County 4-H dairy calf club. My calf was one year, three months old on February 5th. Her name is Banco Soldene Korndyke. I curry and brush her every day. Her mother gave 330 lbs. of butterfat as a two-year-old. I feed her a ration of grain, hay, and silage. My address is Haddam, Kansas.

Gladys Young.

Joins the Juniors

Hoard's Dairyman Juniors:—When I got home from school I heard there was a letter for me. Eagerly I opened it and when I saw it had Hoard's Dairyman on it I hoped it would be about being a junior. I was so glad that I just jumped up and down. A long time ago, while looking at an old paper, I saw where boys and girls ought to be juniors. I addressed an envelope but never sent it so you can imagine how glad I was.

Yes, I was at the Cattle Congress. Had more fun and learned more than any one can tell. I looked at all the stock, especially the Jerseys, for that's my favorite breed. I enjoy club work very much and I think every girl and boy should be in some kind of club work and should be a Hoard's Dairyman Junior. You can trust me to read the Junior Department; I always have. I like the information and every bit of it came in handy.

One time a Junior wrote that his calf, when being led, ran ahead of her and then there was the answer. My calf did the same, so it helped me a lot. My calf's name is "You'll Do's Daisy Irene."

My address is R. 1, Box 88, Shelisburg, Ia.

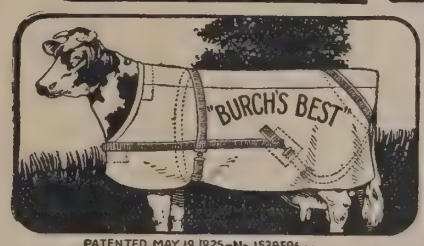
Lavonne Fuehrer.

Likes Hunting

Hoard's Dairyman Juniors:—I received my fob, button, and creed. I also got my watch on my birthday, February 19th. Now I am all fixed up. I have been reading the story of the "Big Black Bear." One day I went hunting. I didn't see anything that day, but that night I set my trap by the house. When I got up in the morning I had a civet cat. Daddy got the twenty-two and shot him. If any of the juniors wish to write to me, my address is P. O. Box 17, Esparto, California.

Jackie Pilgrim.

WHEN you invest in a cream separator let one thing be your guide: *See that it has ball bearings.* In the old days the turning of the best machine was a man's work—work requiring strength and endurance, day in, and day out. That day is past; the swing is all toward the easy-turning, durable, ball-bearing cream separator.



McCormick-Deering brought in ball bearings, by far the greatest improvement in separator design in recent years. Any woman can turn the McCormick-Deering Primrose with the greatest ease—the children can turn it easily too. Friction in the cream separator for the first time is reduced close to the vanishing point. And ball bearings *keep* the machine that way—plain bearings can never be so satisfactory.

Light-running durability is in keeping with McCormick-Deering quality and efficiency throughout. Years of steady service in every community testify to clean skimming, sanitation, easy cleaning, and a faultless splash lubrication system (positive, automatic, to every moving part). This machine comes to you to earn the money that pays for it—our 12 months' payment plan will help. Sold by the McCormick-Deering dealer in your town.

INTERNATIONAL HARVESTER COMPANY

rule, the hens that are still their old feathers in Septem- the best layers. Experimen- show that the longer the rest the lower the production. is we may assume that the ıt molted the last of June, uly, and the first half of Au- the poorest producers in the his assumes, of course, that ding has not been faulty. hings being true, the con- dition of hens in September with respect to molt is a reliable index of their producing ability. The only way this may be turned to practical advantage is to first learn what a good hen looks like in September and then proceed to mark or in some way identify such hens that they may be used to produce eggs for hatching the following season. It is merely a method of selecting the best in order that their good qualities may be reproduced in the succeeding generation of chicks. It is just as important to use good female breeding stock as it is to be careful in the selection of cockerels.

Holstein Milk

Vitality!

HOLSTEINS ARE PRODUCERS

Holsteins predominate in thirty states of the Union. In these thirty states 76 per cent of the Nation's Milk is produced. The average annual milk production of all dairy cattle in these states is 3,806; in the remaining states where Holsteins do not predominate the average production is 2,562 pounds.

Right on the Center of the Stage —

is the Ayrshire. At county, state and national fairs these cattle are the center of attraction.

This is a personal invitation for you to visit the Ayrshire exhibit at your fair. Go look over the cattle, see the champions, and actually put your hands on them. Study the big, strong cows with their square udders, and remember that they are not unlike thousands of other Ayrshires owned by real dairy farmers, who depend upon their cows for a living.

Talk to the owners of these herds. They will be glad to meet you. Don't be afraid to ask for information and prices. Almost every herd has surplus animals for sale; you will be surprised how reasonably they may be bought. If you can't get what you want from the exhibitors at your fair, or if you wish for further information, write to

THE FIRST ANNUAL

MAYOWOOD FARM SALE

50 Cows With C. T. A. or A. R. Records

The breeding operations at Mayowood Farms (owned by Dr. C. H. Mayo) have reached proportions making possible an annual offering of Guernseys and Holsteins from this well known establishment. The offering is made up of representative "Mayowood" cattle —combining May Rose and Cherub Family in Guernseys, and Colantha's and Aagies in Holsteins. The herds are regularly tested under State and Federal supervision and cattle are selling subject to retest.

50 GUERNSEYS

Grades and Purebreds

40 FEMALES — Half purebreds and half grades. The grades are highly bred up cows and heifers and have excellent C. T. A. records and up to 500 lbs. fat. The purebreds have A. R. or C. T. A. records. A representative offering of cows, heifers and heifer calves.

10 BULLS — Some nearly ready for service, by Cherub and May Rose sires from A. R. and C. T. A. record dams.

SEPT. 12th

60 HOLSTEINS

All Purebreds

45 FEMALES—Rich in Colantha and Aaggie Cornucopia blood. Those of milking age have A. R. O. or C. T. A. records up to 600 lbs. Many splendid bred yearlings and 2-yr.-olds, bred to son of Grahamholm Colantha Pauline Segis, 1426-lb. daughter of "Dutch." Also a splendid lot of heifer calves by 1000-lb. to 1300-lb. bulls, from dams with year records up to 1040 lbs. Many excellent show prospects.

15 MALES—Several ready for heavy service. Mostly from A. R. S. O. dams with records up to 1050 lbs.

Your Neighbor Has a **PAPEC** Ask Him!
"The Cutter That Does Not Clog"

"I AM well pleased with the N-13 Papec purchased this year," wrote H. B. Austin, Oct. 8, 1925. "It has never clogged the pipe once and runs so light. It will cut and elevate twice as much as any cutter that I ever saw. The feed roll is a great thing, no stopping of bundles on the feed table."

Light draft, low operating cost and long life make the Papec the most economical cutter. There's a size to fit your power plant, whether you use a 3 h. p. gasoline engine, a light or a heavy tractor. If you have a silo, a Papec will earn you big returns. Let us show you how.

Life and Work of T. L. Haecker

(Continued from page 792)

termine the influence of a change from barn feeding to pasture on the butterfat content of the milk, concerning which he said, "The most radical change that a cow can be subjected to, so far as feed is concerned, is from a generous dry feed to a luxuriant pasture. With some there was a noticeable increase in per cent of fat on pasture; with others it remained practically stationary, while with others there was a marked decrease. Surely the ways of the cow are very strange. She does and she doesn't, and then again she does neither."

Daily Inspection of Herd

Professor Haecker kept close supervision over all his experiments. Said he, "The writer has always made it a practice to visit daily and closely inspect every animal in the division. The feed boxes and mangers are inspected at least once and more often twice a day. It is an easy matter to quickly detect by the sense of smell if any animal is not properly digesting its food."

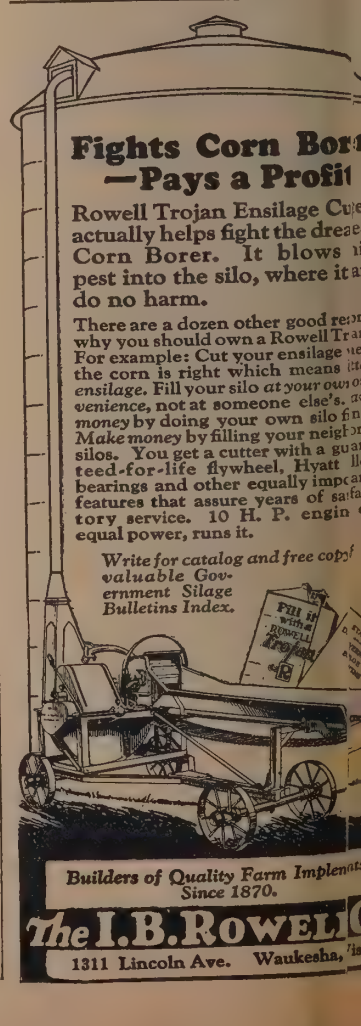
Professor Haecker realized full well that records to be of practical value should cover a fair period of time, as he expressed in these words, "Data covering only a few months during the first part of the period of lactation do not fully reveal the adaptability of a cow for the dairy, because most any kind of a cow will do fairly well for a few months after calving. The real test comes later, when the temporary stimulus of the lacteal functions produced by parturition loses its force and then the tendency to lay on flesh, by a certain style of cow, becomes more pronounced."

Following through those early years at the Minnesota Experiment Station with Professor Haecker, we note with considerable interest the situation in regard to that well known cow feed, bran. Says the investigator, "The crops of 1896 were so large in the Northwest that feedstuffs were so plentiful and prices so low that farmers refused to buy the mill stuffs at any price, and in many instances, in the interior, millers had to use bran for fuel in order to get rid of it."

Predicts 25,000-lb. Cow

While there may have been, prior to the opening of the 20th century, cows that produced as high as 25,000 lbs. of milk containing sufficient butterfat to make 800 lbs. of butter, the average dairyman of that time would have considered any one abnormal who would say that such a production was entirely within the range of probability. Yet at that time Professor Haecker reported just such a condition. Nor did he arrive at his conclusions hastily or in a haphazard sort of way. He calculated accurately from facts that he had demonstrated to be true. This is how he arrived at his conclusions:

"It may be that a cow in the best possible physical condition and having extraordinary feeding powers might digest 20 lbs. of dry matter daily. With a large middle and light quarters and weighing only a thousand pounds, she would require 4,380 lbs. of dry matter during 365 days for food of maintenance. If she made no gain in weight and had no foetal growth to nourish, she would have available for milk production during the year 6,570 lbs. of dry matter. Calculating a yield of one pound of butter from eight pounds of dry matter, an annual yield of 800 lbs. of butter, or of milk 25,000 lbs. containing 2.8 per cent fat, would seem within the range of proba ty."



It would be well for present dairy farmers to take cognizanc Professor Haecker's observation the *physical tone* of the dairy He said, "It has been shown cows vary from year to year in p cal tone; that at some time in life they will consume more and do more work than they done at any other time; and tha usefulness of a cow cannot be r ured by any one year's perform *Every living thing reaches its ridian of life but once, and if at time all conditions are favorable every opportunity is offered, e ordinary results may be obtaine*

Why Feed Concentrates

Why do we feed concentr Professor Haecker answered th teresting question when he wro one of his first treatises on fe dairy cows: "It has become n sary to feed concentrates in co tion with roughage because the cow has been developed into an ficial animal. Had she remain her original state, when she yi only enough milk to nourish young, she would find enough ment in what coarse feed she eat and digest to produce the ar of milk required for that pu but since her mammary fun have been developed more tha feeding capacity, we must est an equilibrium between the s and demand for nutriment n for the production of the milk, this end we must use some foo contains a larger percentage gestible matter than is fou coarse food."

What do you pay for when yo mill feeds? "Since the supply bohydrates and fat is always cess of our needs, and is prac as free as water, air, and li follows that they lose all comm value, leaving digestible prote measure of the money value our feedstuffs for milk produ said Professor Haecker.

evention and Control of Hog Cholera

T this time last year swine producers were sailing along confident that their pigs would market weight without serious or handicap. Two months later nany farms hog cholera had d anticipation into despair. The nd for serum was greater than mmediate supply. Before enough n could be made to meet the ion thousands of hogs died and virus of hog cholera was left ig in and about the hog yards e farms where the disease left adly toll.

cording to the U. S. Department griculture, the value of the hogs y cholera in a single year in the d States has amounted to as as $65,000,000. The average al loss from this disease over a d of 40 years is estimated to been not less than $30,000,000. loss compels serious considera- of and attention to the preven- and control measures known to ost effective in reducing the es of the disease.

the South, where the winters are and the temperature more or less m, severe outbreaks of hog chol- ay occur at any season of the In the Middle West statistics 14 states show that the disease es its greatest height during Oc- and November. If this be true ans that preliminary outbreaks e disease appear in late August uring September. That time is here. The effective control of rst appearance of the disease is ative if the experiences of last n are to be avoided.

st, let us consider the nature of isease. It is caused by an or- n, commonly called virus, so that it will pass through the of the finest filters; it has never identified by our best micro- s; it has never been cultivated ially in laboratories as many germs have; it is known only e effects which it produces when gained entrance to the blood n of susceptible swine. It plays vorites among breeds of swine oes it stop at type, color, age, or condition of animals. The isms are present in the blood, feces, and secretions of the eyes ose of hogs sick with cholera. accompanied with fever, has a death rate, and so far as is known ot affect other animals.

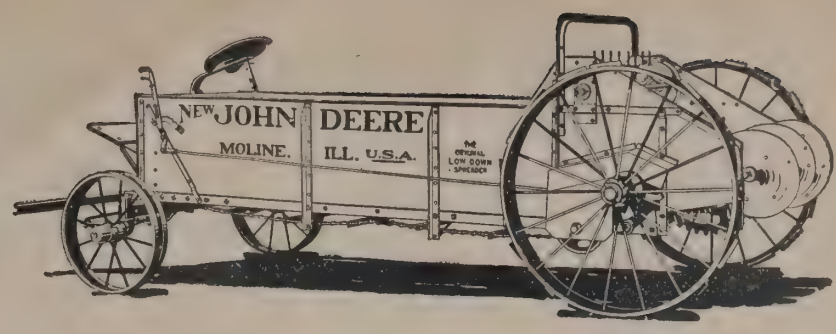
herds that have not been made ne to the disease by the serum irus treatment, it is highly im- nt that owners keep close watch ir hogs to note if any are sick. e first appearance of a sick ani- t is highly important to find out liately the cause and if a posi- iagnosis for cholera is made or a diagnosis that suspects chol- he well hogs should be treated liately. Whether the serum and should both be used or the serum alone to give temporary immunity depends on the condition of the herd. Temperatures should be taken of every hog. If normal, that is below 104 degrees when the hogs are not unduly excited, it is probably advisable to give the double treatment. All hogs showing a temperature above 104 degrees should receive only the serum. The judgment of the veterinarian should be respected in all herds where diagnosis on the first sick pig reveals cholera as regards the treatment to be given. The first precaution is to watch for sick pigs, then determine immediately the cause and act promptly.

The symptoms of hog cholera, while sometimes confused by complications, are fairly easy to recognize by a competent person. The first suspicion shows up when all the pigs do not come out of their sleeping quarters promptly when feed is offered. Feeding pigs in a hurry at this time of year may be the forerunner to a badly infected herd before the owner knows anything is wrong. See that all of the hogs come promptly for their feed.

If one or more of the animals hang back, arch their backs, and appear cold and shiver, they should be separated immediately and observed further. If these pigs are affected with cholera, they become gaunt or tucked up in the flank, they have a weak and staggering gait, particularly in the hind quarters. The sick pigs may cough; their eyes usually are inflamed and show a whitish discharge which may cause the lids to stick together. Immediate action must be taken. Call a veterinarian. He will take temperatures. If the temperatures are above 104 degrees, the veterinarian should kill one of the sick pigs and make a thorough post-mortem examination.

The following parts of the carcass may contribute something of value in making a thorough post-mortem examination:

1. The skin should be examined for purple blotches resembling a birthmark. 2. In acute cholera, the surfaces of the lungs frequently show small red spots varying in size from a pin head to a pea. 3. When the membrane surrounding the heart is removed, the surface may show blotches or blood spots similar to those on the lungs. 4. Changes in the liver are variable and are not very dependable. 5. In acute cholera, the spleen or melt is often large, dark, and soft. In chronic cholera it may be smaller than normal and grayish in color. 6. The kidneys when removed are found surrounded by a thin, fibrous tissue. When this is peeled off examination should be made for dark red spots varying in size from mere points to areas as large as a pin head. 7. The inner surface of the bladder will usually show bright red specks which cannot be washed off. 8. In some cases the stomach, when opened and washed clean, shows red spots and ulcerations. 9. The outer surface of the small intestines may have the appearance of being spattered with blood which cannot be washed off. 10. In chronic cholera, the inner surface of the large intestines may show ulcers commonly termed "button ulcers." 11. The changes that take place in the lymphatic glands frequently are striking. In healthy hogs, these glands are light grayish in color; in cholera they may be enlarged and red and in severe cases they may appear almost black.



The diseases most likely to be mistaken for cholera are swine plague, pneumonia, tuberculosis, anthrax, necrobacillosis, and lung and bowel disturbance due to worms.

In preventing hog cholera, there is only one sure way of doing it and that is to treat with serum and virus before the disease has invaded the herd. The time when this may be done most economically is immediately after pigs are weaned. If this has not been done and cholera appears in a community, every effort should be made to confine the outbreak to the first farm where it appears. The herds on farms in the immediate vicinity should be watched carefully and probably treated with serum and virus. Strict quarantine should be exercised on the farm where the disease has appeared. Prevention is more certain and the cheapest in the long run.

As to control measures, it should be remembered that the disease does not occur in any herd except through the introduction of the specific germ of that disease; further, that, as far as is known, the germs of hog cholera develop and propagate only in the bodies of hogs. A hog sick with the disease must always be regarded as the most dangerous agent in the spread of cholera.

Control measures must first be directed to keeping the disease confined to the first farm where it appears in a community. To do this herd owners must be advised as soon as the disease has appeared in order that they may immediately protect their own herds, as well as co-operate in preventing the spread of the disease. The owner of the herd where the disease has appeared must not only take immediate steps to stamp it out in his own herd, but also exercise every precaution in preventing it from being carried to neighbors' herds. He must not visit neighbors' hog yards nor permit them to visit his yard. He must not dispose of dead hog carcasses in any other manner than that of burning or burying deeply—four feet or more. Burning is preferable if done completely. It is easy to burn the carcass of a dead hog by raising it up from the fire. A discarded rake wheel placed horizontally, resting on clay or concrete building blocks or on bricks up off the ground a foot or more, may be used. The carcass is placed on such wheel and the fire and fuel placed beneath it.

Let us hope that hog cholera does not start anywhere but let us be prepared to stop it in its tracks if it does appear and thus escape a situation similar to that of last season.

"The Biggest Money-Maker on My Farm"

Says an Iowa user of the New John Deere Spreader.

"I never knew what a spreader meant to me until I bought a New John Deere.

"Spreading manure is no longer the detested job that it used to be. My new John Deere not only saves me a lot of work in loading and in spreading but it does a real job in all kinds of manure. I can now control the amount of manure that is spread on different fields and I am building up the soil and raising bigger crops on more acres by this plan. My John Deere is the biggest money-maker on my farm.

"Another thing I like about the John Deere is its easy pull. I use only two horses most of the time and it doesn't work them hard either."

This new John Deere three-beater spreader, the spreader with the beater on the axle and the box-roll turn, is a real money-maker for its thousands of users.

If you have never owned a spreader or if your old one is not satisfactory be sure to see this new John Deere, the spreader that is easier to load, pulls lighter, does better work and lasts longer. It is on display at your John Deere dealers.

You can also get the famous John Deere Spreader, the spreader with the beater on the axle, a single beater machine, if you prefer this type. This spreader, also, has many exclusive features that you are sure to appreciate.

Here's a Valuable Booklet on Manures and Fertilizers—FREE

"Soil Fertilizers"—a 38 page booklet crammed full of valuable information on the most effective use of barnyard manure and other fertilizers will be sent you free together with folder describing the New John Deere Spreader. Write to John Deere, Moline, Ill., and ask for booklets T-514.

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

Men *who thresh*

must enjoy their food to get the good out of it

IN these mid-summer days of threshing, when the drain on a man's physical energy is heavy, he must eat to replace that energy. But he must eat with enjoyment to get the good from his food—and that's why it is well to have Diamond Crystal for table and for cooking.

Diamond Crystal flake salt makes food more pleasing and enjoyable because it brings out the natural flavors and goodness—it makes the food taste better. You can use more Diamond Crystal—and the food tastes all the finer—because Diamond Crystal is pure and mild-flavored. Get one of the handy-pouring packages of Shaker-Salt (there is no other Shaker Salt). Then you will know how good food really can be.

There is a Diamond Crystal Salt for every farm use—for table and cooking, for butter and cheese-making, for canning, for curing meats, for livestock. Ask for Diamond Crystal at the store where you trade.

"The Salt that's all Salt."

Diamond Crystal Salt

Poultry on the Dairy Farm

Loss of Incubator Chicks

I have lost about two-thirds of my incubator chickens this year. The eggs hatched fine, almost every fertile egg hatching, and the chickens were very lively for the first 2 or 3 days.

Thinking maybe the eggs were to blame I hatched some under hens and gave them the same feed and care as the incubator chickens and didn't lose any at all. If you can help me locate the trouble I will appreciate it very much. I have also lost 4 or 5 chickens lately that were 8 or 10 weeks old. They were very runty with the wing feathers drooping and very rough looking. I opened them and found the gall bladder about as large as a man's thumb. In one the gall had burst.

Jetersville, Va. H. A.

It is almost impossible to give a correct diagnosis for a loss in your flock, because of so many factors that might have been responsible for it.

As a prelude, however, it can be admitted that this year because of the favorable conditions, the chick losses have in some respects been a little higher than normal. By this I mean that probably whenever the hatches run high there are some chicks hatched naturally weak that are able to get out because of satisfactory conditions, while if it was a poor season, with hatches running poor, a lot of those would be eliminated because they would undoubtedly have never gotten out of the shell. This, then, is one factor which we must consider.

A second thing that should be included is just the natural weakness and low vitality of the stock, a factor which is not apparent when looking at the birds and something a person can't designate by any particular characteristics, but which shows up when due consideration is given to the complete records on a bird including hatchability, chick mortality, and things of that sort.

In view of the fact that you have not had apparently any loss when you were brooding the chicks under a hen, I would be very much inclined to come back to the old, old, reliable standard cause for most mortality, which means unsatisfactory brooding conditions. This may mean not enough or too much heat or several things of that sort.

There is absolutely nothing put into a chick by a hen's broodiness that can't be put into that same chick by incubation, providing all of the things are the same. The same thing is true of brooding in that satisfactory results can be obtained with an artificial means as can be when hens are used for that purpose.

I don't believe that you have to go back to your incubator as a cause for this loss, since if conditions had not been right you would not have obtained as high a percentage of hatchability as you were able to do. You would also have found that if incubation conditions were wrong that your hatch would have been delayed or dragged out over a considerable length of time instead of cleaning up rapidly as we expect a good hatch to do, and the chicks themselves instead of being nice and large, fluffy and lively, would appear to be rather small and dried out without that nice, loose, fluffy appearance to them, and the activity which we like to see in a bunch that are well hatched.

Oftentimes in incubating a mistake is made in using the nursery chamber in a machine, and if the chicks are placed down in there, chilling is often a result; second, there is always a tendency on the part of a person to leave the chicks in a machine sometimes over a longer period than is advisable with the result that they become dried down to a considerable extent and brooding results are not quite what they should be.

In this instance, then, the thing to check on would be to see that you did not leave the chicks in the machine so long after the hatch was completed that they became rather dried out and were panting from excessive heat, but were removed thoroughly early and placed in chick boxes or some place similar to that where your temperature would be satisfactory and where the chicks would have a chance to obtain that apparently necessary sleep and rest before being placed under the brooder.

Second, a check on it would be with respect to the way in which the hatch cleaned up, noticing whether they came out at the time that they should or whether the hatch was delayed over a considerable length of time, with resulting indication of faulty conditions.

Then the point to bear uppermost is to see that the brooder conditions are satisfactory and the chicks are not to be put out on sand to be filled up on that, causing a loss; that the feed is clean and not moldy, that the temperature is sufficient to cause them to form a good circle around the brooder at night to prevent chilling, and also that the temperature was not too excessive as to bring up the room temperature itself, and cause the chicks to be overheated.

It is almost impossible to check up on the second loss, that is in those chicks, without knowing what your ration has been. This year the one point that a person must stress absolutely in connection with all rations is to be positive that the corn which you are using is clean and wholesome and absolutely free from any sort of mold. With the corn that we had matured last year, or rather not matured last year, one will find that the feed is very apt to become moldy and this will cause a serious loss, oftentimes going over a considerable period among the chicks. If your brooding conditions are satisfactory and your feed is the combination which it should be, there is no need to be alarmed at all, and no necessity of giving any sort of material to them other than that classified as good, wholesome feed. If conditions are right the chicks are going to grow right. If the conditions are not right, there isn't any sort of material that is going to put them back into shape for you until the remedy is rectified and even at that there has been some damage done which will occasion a loss that cannot be avoided.—J. B. HAYES.

Dose: 1 nces, given in a quart of cold Rectal injections of cold wa- ter may also help. Prevention is of most importance. Avoid the causes we have mentioned.

Garget

I have four cows which gave thick milk from their back left quarters for a milking or two and went down in their milk for four or five days and came back after that and milked same as always. The heavy milking cow's quarter got hard and feverish. Do you think they have garget? Can it be cured?

Lawrence, Kans. C. H.

The disease is mastitis, popularly called garget. It is germ-caused and incurable when established or chronic. Isolate affected cows as the infection may be carried from cow to cow by the milker's hands or cups of the milking machine. Cleanse, disinfect, and whitewash the stalls that have been occupied by affected cows and include the floors and gutters. Catch the abnormal milk in a vessel containing a disinfecting solution and then throw it out in a place from which cows are excluded. Have your veterinarian give affected cows treatment with mastitis serum. It may prove remedial in a starting case. Eventually, however, recurring attacks end in incurable, destructive, purulent mastitis which is contagious.

Lump Jaw

Please give me a cure for lump jaw.

Brawley, Calif. L. R.

Potassium iodide, given internally, is wonderfully effective for the cure of lump jaw (actinomycosis) unless the bones of the head are badly involved. The average dose is 1 dram, given twice daily in water until it causes the eyes and nostrils to discharge. At that stage the treatment should be discontinued but may be repeated, if necessary, when they subside. A bulletin on the subject may be obtained from the U. S. Department of Agriculture, Washington, D. C. Local treatment consists in removal of the diseased tissues by dissection or sloughing out with caustics, if a veterinarian can be employed; otherwise a proprietary lump jaw cure should be used.

Precocious Lactation

I have a yearling heifer that is bred and due to freshen July 4. A strange calf in the pasture has sucked her and true milk is in the udder. I have her away from the calf, but I want to know if I should let her be or milk her. The heifer's udder is not so very large but is swelled in bunches.

Dorchester, Wis. G. S.

In such a case it is advisable to "dry off" the secretion of milk in the usual way, unless garget is present as indicated by a slimy or curdled condition of the milk. If the milk is abnormal strip the udder clean several times daily until the milk becomes normal; the secretion may then be dried off. If it does not become normal keep milking up to "freshening" and the garget may then subside, but there is no certainty as to that as garget more often becomes chronic and incurable.

The Veterinary Situation

(Continued from page 793)

tensive study, besides a good high school education as a foundation. Nor is the situation improving noticeably thus far. In the combined freshman classes of all the veterinary colleges there were only two more students in the fiscal year 1926 than in 1925 and in all educational work there is a tendency for some students to drop out, especially the underclassmen.

Meanwhile the field for well trained veterinarians has broadened immeasurably, and now includes many lines of disease-control work, city milk and meat inspection, positions of state and county veterinarian, the manufacture of biological products, employment in the army veterinary corps, promoting live stock raising, and teaching in this country and abroad. In private practice, equine work is still extensive in view of about 17 million horses in the country, motor transportation notwithstanding. Besides there is a greatly increased demand for tuberculin testing resulting from the national campaign to eradicate the plague of tuberculosis.

More than that, the new, lusty industry of fur farming, with its valuable breeding stock kept under artificial conditions, makes skilled veterinary service essential. The poultry industry with its current drive to accredit baby chick hatcheries and breeding farms as free from serious diseases likewise has need of veterinarians.

Best estimates place the number of qualified graduate veterinarians in the entire United States today at about 10,000, and many of these men have probably reached the age when they are slowing down or retiring. Considering the total animal population of the United States, there is scarcely one veterinarian for each 18,000 domestic animals, not counting dogs, cats, fur bearers, or poultry.

To the practical farmer and stockman, the situation calls for greater preparedness than ever before in coping with the diseases and pests that threaten domestic animals. He can do much to prevent; he can improve sanitary conditions; he can be careful in introducing new stock on his farm. The foresighted farmer also will cultivate the acquaintance of the qualified veterinarians in his locality, for it will be some years before many others will appear to hang out their shingles. The present shortage of students in the veterinary colleges and of practitioners, in proportion to the number of domestic animals in the country, does not add to the security of the live stock business. The solution is more young men in training and meanwhile every precaution to keep farm animals healthy.

Here's the place where
flies and disease germs breed

but it's easy and inexpensive to get rid of them this proven way

Flies and disease germs breed and live in filth. And flies carry the disease germs—especially those of typhoid fever—wherever they go, contaminating even the food you eat.

Physicians and health authorities everywhere recommend this simple method of getting rid of these deadly flies and germs: Simply sprinkle a can of pure, high-test Lewis' Lye—nothing else—into your outside toilet twice a week. It kills disease germs instantly and absolutely prevents flies from breeding. Also removes objectionable odors and destroys rats.

Use pure Lewis' Lye this way regularly, especially during the summer and fall—and get your neighbors to use it. Remember, that a single case of typhoid—even if it should not result fatally—will cost more than thousands of cans of Lewis' Lye.

Lewis' Lye is sold by reliable grocers. If you are unable to secure it from your nearest grocer, take no chances with substitutes, send us a postoffice money order for $1.80 and we will send you by express a dozen cans—a three months' supply.

In any case, send us your name on a post card and we will mail you our book—"The Truth About a Lye"—containing hundreds of uses for lye and valuable recipes. Also our booklet on the prevention of Hog Cholera, and a free sample of our new cleanser and water-softener—Pensal.

Dept. 120
Philadelphia, Pennsylvania

for feeding calves

Do you know that you can cut milk costs in half by adopting the "minimum milk method," using dry skim milk? Hundreds of dairymen who sell all their whole milk are making this big saving. They simply mix a pound of dry skim milk with a gallon of water, making a money-saving mixture which young calves thrive on. And they buy a pound of dry skim milk for half or less of what they receive for a gallon of whole milk. (1 gallon whole milk contains 1 pound milk solids.)

AMERICAN DRY MILK INSTITUTE
160 North La Salle Street Room 720-C
CHICAGO, ILLINOIS

FREE Write today for "Better Calves" giving successful feeding methods. State number of calves you feed. We'll tell you where to buy dry skim milk.

Remixed—1 pound dry skim milk to 1 gallon of water—is also good for pigs and poultry. It is splendid also for baking.

Protein—New England's Handicap

(Continued from page 791)

have the effect of making a more reasonable lime price.

There are marginal producers in all lines of business and especially farming. Most of the marginal dairymen milk cows because their fathers did or because they are not progressive enough to start any other line of farming. Little progress is being made by this group in solving the protein problem. Some very real progress is being made by men whose cows are above the average and who are striving to improve their own conditions in a financial way.

Much more protein can be economically grown on New England dairy farms. Haymaking machinery is at hand. The will to use lime and a little extra effort will put many a dairy farm in a more independent position as regards protein, and at the same time on a better paying basis.

JERSEYS

A "Testimonial"

A prominent breeder in Wisconsin bought a bull from us in October, 1924. Under date of July 11, 1927, he wrote us as follows:

Ravine Farm, Prairie View, Illinois.

Gentlemen: The bull which I purchased of you has proven very successful. I now have ten of his heifers and am looking for his successor. Have you anything around a year old? (Signed) J. A. Martin.

We have just sold Mr. Martin a new herd sire of excellent breeding. Send for our circular describing the Jersey bulls which we have for sale at the present time.

— Twice-a-day Milking

ANTON'S KING CONFIDENCE—43517 A. R.
Photo taken when two years of age.

SIRE—Anton's May King, sold for $7000.00. DAM—Ma Chere Confidence who has a two year old record of 511.82 lbs. butterfat and a junior four year old record of 764 lbs. butterfat. Ma Chere Confidence is one of the outstanding daughters of the famous Jardinier's Masher. A. K. C. sires excellent udders, long deep bodies, straight top lines, and real production.

You can buy bull calves out of his daughters and sired by outstanding bulls, from us very reasonably. Do not write us if you want a serviceable bull. Our males are always sold before they are old enough for service. Buy a young calf, raise it yourself, and save money.

PLAN NOW FOR THE FUTURE

HOARD'S DAIRYMAN FARM, Fort Atkinson, Wis.

Milk in England

The total production of milk in England and Wales is some twelve billion pounds, approximately half of which is consumed as whole milk. About twelve billion pounds of milk is imported in the form of condensed and powdered milk, butter, cheese, and other manufactured milk products.

This makes the total yearly consumption of milk and milk products equivalent to some twenty-four billion pounds of milk, or about one-fifth of the 117 billion pounds consumed in the United States. The population of the United States is approximately three times as large as the combined population of England and Wales. The average per capita consumption of milk and milk products is 1000 pounds in the United States as compared with 635 pounds in England.

BROWN SWISS

Brown Swiss Bulls Mark Imprint on Grade Herds

Extra large production in a herd of grade cows may be gained by breeding with a Brown Swiss bull. They sire strong calves of a uniform type, well adapted for the general dairy farm. Mature bulls weigh between 1,800 and 2,500 lbs.

We will be glad to help you secure a Brown Swiss bull and, if you desire, a heifer or a cow.

We Will Make A Good Friend When We Sell This Bull

CARNATION OLLIE COUNT
Born Feb. 8, 1927

With 18 cows and heifers of this bull's family in our herd we know what you can expect from him. The entire 18 have made records of 19 to 21 pounds as two-year-olds and 32 to 38 pounds as mature cows. They *all* have square rumps; they test high and produce well. You will see a 33-pound 4-year-old of this family in our show herd this year. Last year she was first at Wisconsin.

If you want a bull, a real one, from as promising a 2-year-old heifer as we own get this one. His dam is a 19-pound two-year-old and a granddaughter of the 38-pound cow we mentioned above.

LINE BRED IN THE BLOOD OF IOWANA SIR OLLIE—and Look At His Topline!

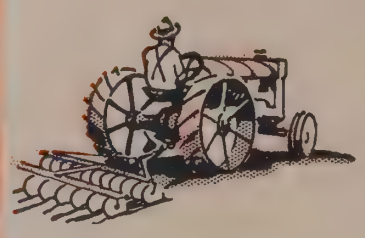
NORTHFIELD, MINNESOTA

How a slight extra cost boosted spinach yield 150%

The right fertilizer boosts the marketable yield.



RESULT—more profits.

Spinach was planted in two fields, side by side, at the New Jersey experiment station. One field was left unfertilized. It produced 198 crates of spinach to the acre. The other field had 1600 pounds of a 9-8-3 fertilizer at planting time, *and yielded 507 crates per acre.*

Use "fertilizer" logic when you buy oil

The correct grade of Mobiloil cuts the engine expenses.

RESULT—more profits.

Any farmer knows that he usually gets back more money than he puts into the right fertilizer. But do you realize you get back more than the extra few cents you put into Gargoyle Mobiloil? An immediate cut in oil consumption of from 10% to 50% frequently brings the cost of Gargoyle Mobiloil below the cost of other oils. Other savings come in lower repair bills, less time out for break-downs, less over-heating, and a marked cut in carbon troubles. Gargoyle Mobiloil brings you these savings because it has an added margin of safety in lubrication to meet every engine need.

Tractor oil . . . automobile oil . . . and—?

YOUR guide—if your car is not listed below see any Mobiloil dealer for the complete Chart. It recommends the correct grades for all cars, trucks and tractors. And remember that . . .

609

automotive manufacturers approve it!

The grades of Gargoyle Mobiloil, indicated below, are Mobiloil "B," Mobiloil Arctic ("Arc."), Mobiloil "A," Mobiloil "BB," and Mobiloil "B."

Oils are frequently bought and sold under misleading terms. The terms "tractor oil" and "automobile oil" are used as though that described the correct oil. But tractors vary greatly in design. So do automobiles. So do trucks. The Mobiloil Board of Engineers has made a special study of all engines, yours included. And their recommendations are so accurate that 609 makers of automobiles and other automotive equipment do not hesitate to approve them.

You will find that Mobiloil is not only worth its extra price but is worth a trip to town where this is necessary. Take advantage of the substantial savings on barrel and half-barrel orders of Gargoyle Mobiloil. The complete chart at all Mobiloil dealers' tells you just which grade of Mobiloil to use in each of your motors.

don't fool yourself

They talk about you

It's a fact that most of those who offend by halitosis (unpleasant breath) are unaware of it.

The one way of putting yourself on the safe and polite side is to rinse the mouth with Listerine before any engagement — business or social. Immediately, every trace of unpleasant odor is gone, and with it that dread fear of offending. And the antiseptic essential oils combat the action of bacteria in the mouth which is the source of most cases of halitosis.

⅓ Had Halitosis

120 hotel clerks, 40 of them in the better class hotels, said that nearly every third person inquiring for a room had halitosis. Who should know better than they?

Face to face evidence

Really fatidious people keep a bottle of Listerine always handy in home or office to combat halitosis. It's a good idea for everybody to follow Lambert Pharmacal Co., St. Louis, U. S. A.

LISTERINE

—the safe antiseptic

FALL IN LINE!

Millions are switching to Listerine Tooth Paste because it cleans teeth whiter and in quicker time than ever before. We'll wager you'll like it. Large tube 25c.

Eastern States Food at Eastern States Show

In order to present the high quality
f eastern food products in an attrac-
ve manner and to further the con-
mption of home grown food, the
astern Aberdeen Angus Association
ill operate two standard pullman
ning cars at the Eastern States Ex-
osition throughout Exposition week
om September 18—24.

Every item of food offered in the
vo dining cars at every meal served
ill be from eastern territory. There
ill be beef from Aberdeen Angus
ttle bred and raised on New Eng-
nd and New York farms and fat-
ned with grain and other products
ised on these same farms. Bread
ill be served made with wheat from
ennsylvania. Onions grown in the
onnecticut Valley will be included
the menu. Maine potatoes will be
ed. The several New England dairy
ttle associations have agreed to
rnish milk and cream. Butter will
from New England dairies. So
ill the cheese. Vegetables will be
rved grown on farms in Western
assachusetts. Fruit will all be from
ew England and apples will come
om the orchards of the Connecticut
alley.

The entire service has been de-
gned by the Eastern Aberdeen An-
us Association to prove conclusively
at products equal or better than
ose of any other part of the country
n be grown in New England and
presents another step toward the
juvenation of New England agri-
lture.—J. H. FIFIELD.

A Milk Bar in Oregon

HOARD'S DAIRYMAN:—On a busy
reet corner not far from the court
ouse and public market square in
ortland, Oregon, H. D. Howard, a
920 dairy course graduate of Oregon
gricultural College, is busy several
ours a day serving milk and other
airy products to a clientele made up
judges, lawyers, doctors, working-
en, and people from every walk in
fe. He is proving to his own satis-
ction that it is possible to profitably
ll a great quantity of milk over the
nch counter when everything looks
ick and span.

He has no chairs, only a brass rail-
g to put the foot on and a clean
hite counter on which to set the
ilk glass, but we have never seen an
merican bar so crowded with eager
stomers as was this little creamery
nch counter the day we chanced to
ss by.

Milk inspection in the cities of the
orthwest is especially thorough and
was when Howard was serving as
ilk inspector under Dr. D. W. Mack
Portland six years ago that he de-
ded to start a creamery for making
utter. He had a feeling that people
ke to see how things are done so he
stalled his churn right out where
veryone can watch the process. He
ow makes a thousand pounds of but-
r a week and sells it right over the
unter to his milk and buttermilk
trons. He gradually worked into
e lunch counter business and he
d so well that he was able to buy
e place three years ago.

The sign that attracts the transient
sserby is, "Have you tried our
eshly churned butter? It is guar-
nteed to give satisfaction in every
ay." In order to get the right kind
cream he buys only from herds
at he has inspected himself and he
ys from 8 to 10 cents above the
ur cream quotations in order to
t sweet cream. At noon time the
alk on both sides of the corner is
owded with people who are there
get all the buttermilk they can
ink for a nickle. Hot dog, Tilla-
mook and cream brick sandwiches are served, but the only drinks that are poured are sweet milk, ordinary buttermilk, and Bulgarian buttermilk.

"People are taking more and more to drinking milk," said Howard when we came back to talk with the youthful proprietor later on in the afternoon when he was not so busy. "A great many people stop here, buy a whole quart and drink it before they leave. A place like this has to be much like a gasoline filling station, where you can drive in, get your gas and go. You have to have it right out in front of the public. That is why our counter is so near the edge of the sidewalk. In addition to our other milk we are selling from 70 to 80 gallons of Bulgarian buttermilk a day at the same price as sweet milk. The doctors tell people to drink this milk; then they come here to try it and gradually acquire the taste. One man who works near here drinks five quarts of Bulgarian buttermilk a day. He always takes a quart at a time.

"Between two and three thousand people stop here to 'fill up' every day except Sunday when we are closed. We serve good, wholesome products at a small profit from each customer. People can see that everything is clean. That is why hundreds of them come back here day after day and that, too, is why thousands of chance passersby pause to partake of a glass of milk when they see our invitation."

Iowa. PETER GUYSON.

"Make good butter and cheese, and there will be no trouble about selling it."—S. FAVILLE.

WITTE ENGINE

Write Me Today — for new FREE Witte Book telling how you can buy a WITTE Engine for ONLY $5.00 Down and small EASY Payments. No Interest. Absolutely the greatest engine made. Guaranteed for a lifetime. Used all over the world. Will increase your farm profits $500.00 to $1000.00 a year. Runs on all fuels. Simple, sturdy. Gives most power at least expense. Sizes 1½ to 30 H.P. Engines, also 3-in-1 Saw Rigs and Pump Outfits. Write me today for FREE Book and Easy Terms Offer.

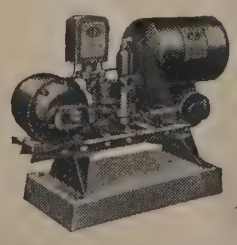
More Milk •• More Profit!

install a D-L Water System now

SECURE the extra milk stimulated by an abundance of fresh, clear water for your cows. Have plenty of water at the turn of a faucet for pre-cooling the milk, for cleansing the utensils, for washing the dairy. You can begin to profit by these advantages at once by installing an automatic DL Electric Water System. And you can also enjoy running water for household purposes, for sprinkling the lawn and garden, for fire protection.

When you install a DL Water System, you have equipment of known efficiency and reliability. The fact that General Motors is back of DL Water Systems guarantees the best of design, materials, workmanship, and service.

Operate Your DL Pump with a Delco-Light Electric Plant



If you're not on a power line, you can operate a DL Water System with a Delco-Light Electric Plant—a plant that will give you ample electricity for all the electric appliances and all the electric lights you want—wherever you want them. It will also give you power for Frigidaire Electric Refrigeration, another product of General Motors.

See the Delco-Light Dealer now. He has been factory trained to give you expert advice and service. Let him show you how easily you can have running water and electric power at once. Or, if this is not convenient, mail the coupon TODAY.

The North Country Farms' herd of purebred Holsteins is, without question, one of the finest Holstein herds ever assembled. Its owner, Mr. George N. Smith of Watertown, N. Y., is an experienced breeder, well equipped to handle a herd of this nature. Many outstanding records have been made at this farm. All cows, including those on test, are milked with the De Laval Milker.

The Best Cows of Each Breed Do Better with the De Laval Milker

THE rapidly growing list of prominent herds and noted producers of all breeds milked with the De Laval is one of the most impressive arguments that could be put forth for it. The fact that so many experienced breeders use and endorse the De Laval as the most practical solution to the milking problem is sound evidence of unmistakable superiority in every way.

The De Laval Milker does a better job of milking, is better for the cow, makes for maximum production as witnessed by the number of test cows milked with De Lavals, and enables the production of a cleaner milk. As a time or labor saver alone, it is a sound investment.

No farmer, dairyman or breeder can afford to be without complete information on the De Laval Milker. A post card will bring the nearest De Laval representative or place De Laval engineering experience at your disposal without obligation.

aid Baker. "She called me up this morning and asked me to start giving her milk tomorrow."

"What I would like to know is why you charge 14c a quart for your milk when I have to pay only 15c in the middle of New York City. The milk I get comes 200 miles and has to be pasteurized and trucked all over the city where labor is high. Distributors make only .3c a quart on their milk, and pay their farmers 6c. How do you explain the difference?

"Come up to the milk house and have a drink of this milk," answered Baker, "and after you have tasted it, I'll show you a few things that make it cost."

They went into a little building that had a cement floor, and was painted white inside. There were bottle racks and various utensils, new to Mather.

"That milk would cost you 75c a quart in the dining room of the Blackstone Hotel in Chicago," said Baker as he took a bottle from the ice box and poured out a generous glass. "It comes in third-quart bottles there, at 25c each. It would also cost you 30c a quart in New York delivered at your doorstep."

"You don't produce certified milk, do you?"

"No, but it is as good as certified milk. A town of this size will not pay the price necessary for certified milk."

"Why not? What's the difference, if yours is as good as certified, as you say it is?"

"If I were producing certified milk, I would have to have two more men around here. I have two men now and I can't afford to keep any more. But this milk is as good as certified milk because it is well within the standards required by law for certified milk. Our bacteria counts are always low, and we have no sediment in our milk."

"But that doesn't explain the cost of your milk."

"Well, I have some figures up at the house that will show the cost of what we do around here. A fellow from the agricultural college was here last winter and worked 'em out. I'll get 'em."

He came back with several sheets of paper.

"I am selling 110 quarts of milk a day, at 14c a quart. I pay my men 19c an hour, and have an investment in my barn, milk house, and cows only, of $13,401 all of which is borrowed, and on which I pay 5 per cent interest."

"Do all dairy farms have this much money invested?"

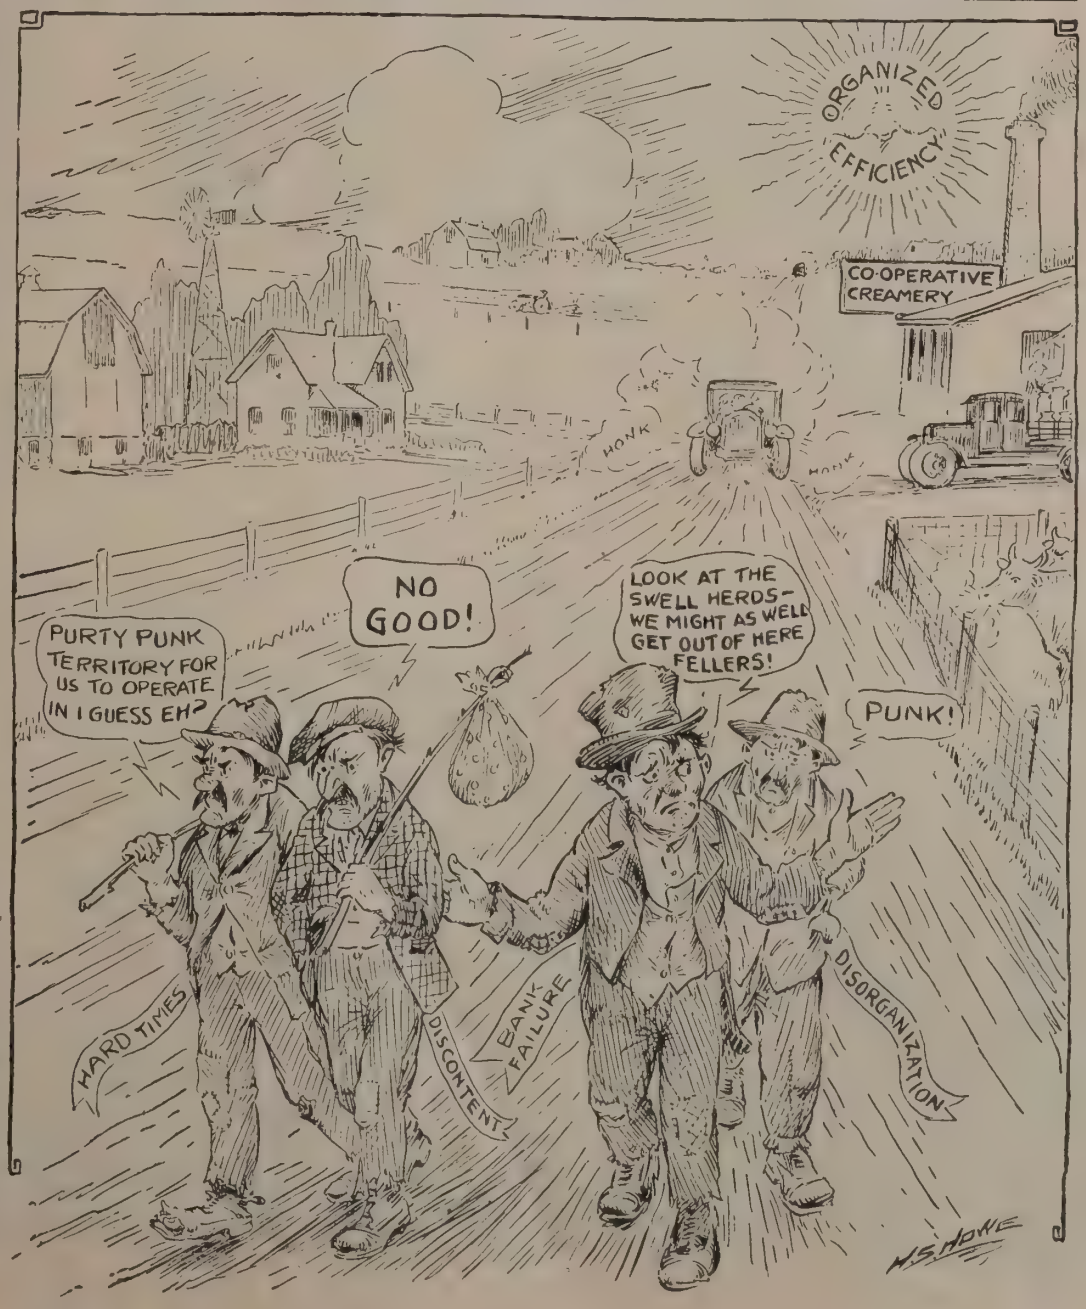
"Some have more, but the farmers who sell 12c milk have quite a bit less. I have $2,550 worth of cows. My barn and silos are worth $3,000. Any farmer may have these items, but he might not have as good cows as I have, and not as good a barn and milk house. I have mostly pure-breds in my herd and by careful management I can make more on my calves than they do.

"This milk house cost me $800 and the built-in ice box was $100. The water system cost $300, and I have $401 worth of equipment in here. The interest on my investment amounts to 1.67c a quart. The investments in the farms this fellow studied ranged from $4,000 to $17,000."

"How much are your feed costs? Mr. Jones in town figures five cents a quart for his feed. Isn't that too high?"

"It would cost him more for feed than it does me, and my cow testing association shows that it costs me 4.72c a quart.

"Let's take the labor cost. My barn labor figures up to 1.60c a quart, which may be divided this way:



Washing cows	.17	cents
Milking	.69	"
Feeding	.35	"
Cows to pasture	.17	"
Cleaning barn	.17	"
Bedding down	.05	"
Total	1.60	"

"You don't wash your cows, do you?" asked Mather, incredulously.

"I should say we do. We brush them all over every

THE HARPIES ON THE RUN

LIFE AND WORK OF T. L. HAECKEI

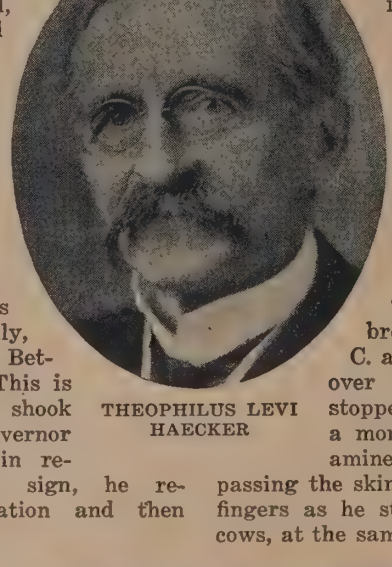
Experiments with Low and High Protein Rations—Relating the Composition of Milk to Feeding Practices

No. 5

TO determine the nutrient requirements of cows, Professor Haecker had the herd divided into two groups in 1902, one getting a high protein ration and the other a low protein ration. This experiment was continued over several years. The return of dairy products was about the same for the two groups, but the low protein group lost in body weight while the high protein ration group gained in weight. Professor Haecker summarized the results, following the winter of 1904, in this manner:

"Since both groups returned the same amount of dairy products and Group I, with a relatively larger ration than Group II, lost in body weight, while Group II gained in weight, it follows that the loss in body weight of Group I was caused by a shortage in the protein supply. The data obtained also show that cows with strong dairy heredity, under careful and skillful handling, may for long and repeated trials return dairy products in excess of the amount provided for in the feed, at the sacrifice of body weight and yet apparently maintain normal physical tone.

"As the final results of these experiments had a direct bearing on the fundamental principles of feeding for milk production, as well as the volume and economy of production, it was deemed of great importance that the physical condition of the cows in the two groups be submitted to others of high repute in such matters.



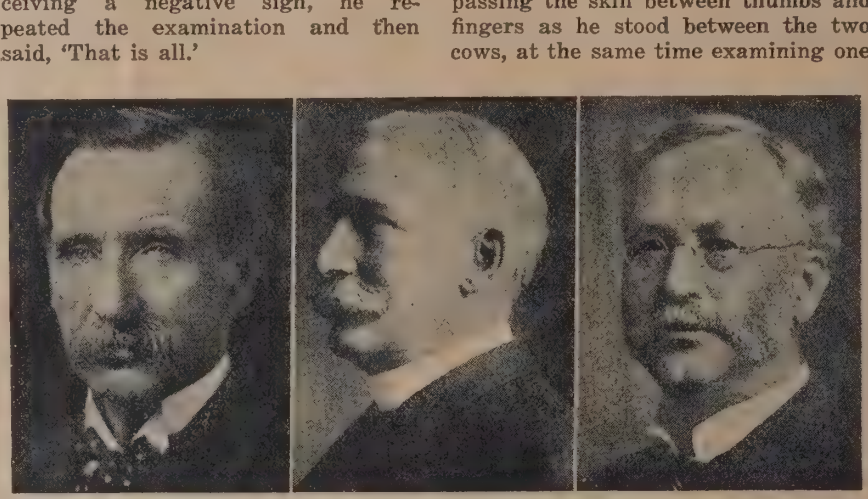
Calls Henry and Hoard

"The Hon. W. D. Hoard of Fort Atkinson, Wisconsin, Editor of Hoard's Dairyman, and Professor W. A. Henry, Director of the Wisconsin Experiment Station, were invited to inspect the cows with special reference to their physical condition. Both accepted the invitation and the day was set for the inspection. At the appointed time Professor Henry reported that Governor Hoard was unable to accompany him but would come a few days later. Written directions were sent to the dairy stock foreman to bring the cows used in the feeding experiment to the stock lecture room in the basement of Dairy Hall in pairs, one from each group.

"The order in which they were to be brought into the lecture room for inspection was known only to the author and the stock foreman. Only two cows were in the room at a time, affording ample opportunity to make a thorough examination for a decision as to which one received the low protein ration. Dean Henry gave each pair a careful and thorough inspection, but from the decisions made it was evident that there was no apparent difference in their physical condition. He requested that the two groups be turned to adjoining paddocks nearby so that he could compare the two groups in the open. This was done and, after looking them over carefully, he said: 'If I should come by on the highway and see the cows in the paddock, I would say, 'there is another lot of fine cows in good working condition but a trifle spare.'

Hoard Makes Inspection

"In a few days Governor Hoard came to University Farm to inspect the cows. Word was sent to the stock foreman to repeat the program given when Dean Henry inspected them. Governor Hoard, Dean Liggett, and Professor Snyder accompanied the writer to the stock room and found Betty and Houston there.



THEOPHILUS LEVI HAECKER

"The Governor gave both a very careful examination, feeling the coat and skin on various parts of the body. Finally, putting his hand on Betty's back, he said, 'This is the one.' The writer shook his head and the Governor said, 'No?' and again receiving a negative sign, he repeated the examination and then said, 'That is all.'

"The writer, affirming the decision, directed that they be led out and Lou II and Dora F. brought in. After giving only a cursory examination, Governor Hoard pointed to Lou II as the one. The decision again being affirmed, the cows were led out and Leeoma and Duchess P. P. brought in. These in turn received very careful and extended examination, with some indications of doubt, but finally Leeoma was selected and, upon receiving an affirmative reply, the Governor said, 'I believe I have got them.'

"The next pair brought in was Sweet C. and Topsy II. He went over them very carefully, stopped and looked at them a moment, and then re-examined them repeatedly, passing the skin between thumbs and fingers as he stood between the two cows, at the same time examining one

EX-GOVERNOR W. D. HOARD, DEAN LIGGETT, AND DEAN HENRY PASSED THEIR JUDGMENT UPON HAECKER'S FEEDING EXPERIMENT, LOW VS. HIGH PROTEIN FEEDS FOR DAIRY COWS

The cows were led out and Fay and Cylene brought in. Going over them in the same way, paying little attention to the appearance of the cows, he pointed to Fay, saying: 'That is one of the low protein ration.' with the right hand and the other with the left. Finally he said, 'It's a guess. This is the one,' pointing to Topsy. 'It's both,' remarked the writer. The Governor manifested great satisfaction and said, 'I told you it was a

FOR MANY YEARS PROFESSOR HAECKER, AS HEAD OF THE DAIRY DEPARTMENT AT THE UNIVERSITY OF MINNESOTA, HAD HIS OFFICE IN THIS, THE OLD DAIRY BUILDING

guess, that I couldn't different tween them.'

"As the other pairs were bro him he had little difficulty in out the ones fed on a low pro tion. Governor Hoard did no teer an explanation as to how tinguished members of one from those of the other. He then requested to do so; but him in St. Louis during the ana Purchase Exposition, the asked him for an explanati answered, 'By the feel of the the first two cows, one had a ordinary thickness, while th had a very thin skin. The fi it was a trial, I pointed to you shook your head. I ther ined them again and after th lected the one with a thick sk

Difference in Physical Con

"The decisions established that in general appearance groups were closely matched only difference, so far as coul cerned with the eye, was t cows of one group were a tri er than those of the other; there was a difference in thei cal condition was shown by Hoard's decisions. There v some significance in his poin Topsy II as the one of the low group when both had receive protein ration, because this w sy's second and Sweet Cicil winter on a low protein ratio

"The same was the case betrayed some doubt before pointing to Leeoma as the on ing the low protein ration, was the first winter she was low protein ration and was high flesh when she freshe had shrunk in yield to a poi an equilibrium had been rea tween the milk solids yielded net nutrients provided in the tion, some nine weeks before of the experiment.

"After inspecting the c ployed in the experiment on medium protein rations du winter of 1903—1904, Profe A. Henry, when asked what tions he had to offer in rega experiment, promptly replied another winter.' As this w cordance with the writer's p experiment was continued al lar lines during ter of 1904—1 the cows lined u same groups a possible."

Haecker Mak Contributi

Probably as i a contribution u been made to th of feeding the d was made by Haecker when ceived the idea the ration to th of the milk He maintained, sequent exp proved, that th was a definite i of the compos the milk, and should get i consideration in rations. e great question was as to et in touch with the farmers benefit the show was being l, and how to persuade them o it. How simple it sounds! course, put big advertise- the daily papers and attrac- ers on billboards and other vantage. Alas, that would in India. Over 90 per cent people are illiterate, and e farmers the proportion is e than that, for in Western iculture is largely in the the Mahrattas, a stolid and essive class but remarkably l independent. If they can- then of what use are news- d posters? The only com- n is by word of mouth. efore, involved an immense f work for months before- he part of enthusiastic vol- ho visited villages system- got the leading men inter- l through them enthused others to come to the show. The village crier, preceded by a deafening tom-tom, proclaimed the coming show, especially on weekly bazaar days when people come from surrounding villages to sell and buy commodities.

And no wonder mouths opened wide when their owners entered the show ground, for much that they saw savored of magic. Those of them who are fortunate enough to possess a well in their fields raise the water by means of a big leather bag drawn up the well by two or more bullocks ambling down a slope. This is what their fathers and their forefathers have done from time immemorial. But those leather bags usually leak so profusely that gay streams of water drop back into the well before the load reaches the top and is poured into the earthen runnels that will carry it to the thirsty fields. But here, near the entrance of the show, was a water court with strange devices for raising the water by means of a well-made iron barrel, guaranteed not to leak. In the picture you can see it coming up, suspended on a pulley. And instead of slow and tiresome and erratic oxen there is a neat little donkey engine. There were also various types of pumps—steam pumps, suction pumps, and a chain water lift. Still more stupendous in the eyes of the visitors were the boring operations. In a land that is thirsty for water they looked with awe on the magic-man who was boring down by either rotary or percussion machines and finding water in the evidently barren soil. The demonstrator (an American) of one of the borers told us he had struck water after three days' boring—and this in the very grounds of the agricultural college.

Again, most of the farmers use old fashioned plows which merely tickle the surface of the ground, but here they saw the newest types of reversible iron plows and actually watched the deep furrow being made by a demonstrating team of bullocks. And as for the motor tractors—well, they could not have been more amazed had the devil himself been handling the steering wheel!

But most steps turned sooner or later to the live stock yard and stayed there. India is a land of poor cattle and many of the visitors had actually never seen specially raised and selected fat stock. Their eyes popped at sight of a cow (Sindhi breed) whose record was 10,380 lbs. of milk during 319 days. She came, of course, from an experimental farm, one of many founded by the government which are peacefully and unobtrusively revolutionizing India's economic life. One of the greatest problems—and most thorny—is the elimination of unproductive cattle.

THE IMMEMORIAL METHOD OF A SHORT STICK THAT MERELY TICKLES THE SURFACE OF THE GROUND

AN INTERESTED GROUP OF INDIAN FARMERS WATCHING A DEMONSTRATION OF THE USE OF A REVERSIBLE IRON PLOW THAT MAKES A FINE DEEP FURROW

A PRIZE BULL

AN IRON BARREL RAISING WATER FROM THE WELL IN PLACE OF THE OLD FASHIONED, LEAKY LEATHER BAG

The calculation of a conservative expert gives the figure of sixty-one crores of rupees ($220,000,000) as the yearly loss to India because of the millions of useless cattle—cows which have ceased to give milk, and decrepit and diseased cattle long past use for draught purposes. This figure is higher than the yearly expenditure for the army and navy—which troubles thinking India so much. But, you say, why on earth not kill off the superfluous animals? Ah, there's the rub. The Hindu religion forbids it. All life is sacred.

Once, when our train pulled in at a wayside station, we found an excited crowd on the platform. They had found a cobra an hour previously, just on the point of stinging a sweetmeat seller, but not a soul in that whole station would brave the anger of the gods by taking its life. They had to wait for the train to come in to find a man foolhardy enough to kill it!

As the cow is an object of worship, its life is doubly sacred, and it would be a sacrilege to destroy its divine life. This is a fruitful source of friction between the Hindus and the Mohammedans, for the latter have no qualms about cow killing and sometimes do it quite near the temples, simply to provoke the Hindus. And there are many places in India where the white man has to do without beef because the Hindu element there is powerful enough to prevent all cow killing. In fact, Hindu philanthropists often found and endow old age homes for cattle.

There is such an old pensioners' home in our town. The superintendent and I had frequently exchanged salaams, for his institution is exactly opposite one of our schools. One day he ran over to me and insisted that I see his department. He showed me the rows of ancient cows and bullocks munching fine fodder in their comfortable stalls. He showed me the great storehouses of supplies and the dispensary for the sick animals. Yet there are 60,000,000 human beings in India who are so poor that they go to bed hungry every night! Strange paradox! Kill no animal, however burdensome, but in famine time you can sell your children for bread.

A model barn, which would be considered very mediocre in America, excited much comment, for a barn is an almost unknown luxury. In fine weather the animals are tethered to stakes in the open courtyard of the houses, and in rain they are housed on the veranda or in some crude shed beside it, or even in the house itself.

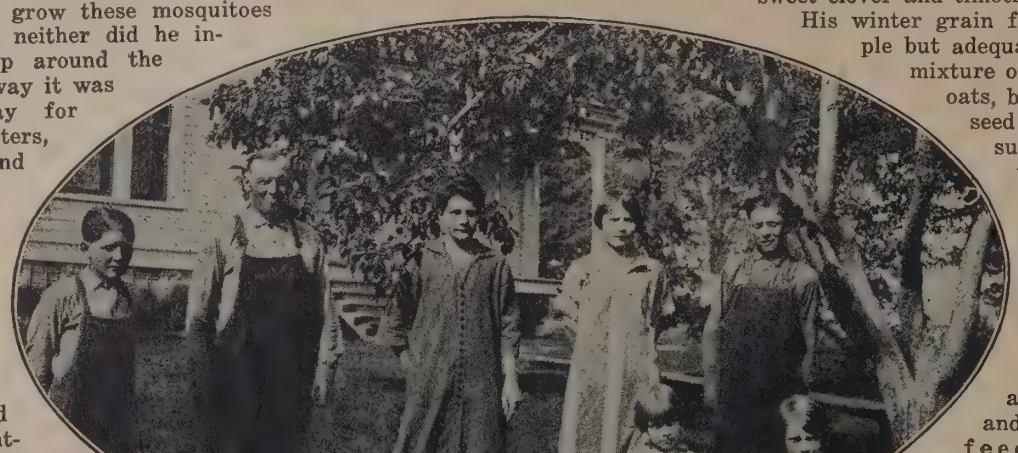
FROM HEAVY FOREST TO FINE FARM

A Wisconsin Dairyman Who Hung Up the Ax and Began Swinging the Milk Pail

THE day Bob Amundson, the lank, genial county agricultural agent for Outagamie County, Wisconsin, and the writer went out to see Charles A. Wussow, we got a bad start. The starter refused to crank the car. We had it fixed at $1.25 per hour and went on our way praying that nothing more would delay us. Luck was against us for the right rear tire let all the air out—not quickly with a bang but in a quiet, sneaking manner. We fixed it and drove on, Bob pushing a little harder on the steering wheel to make up for lost time.

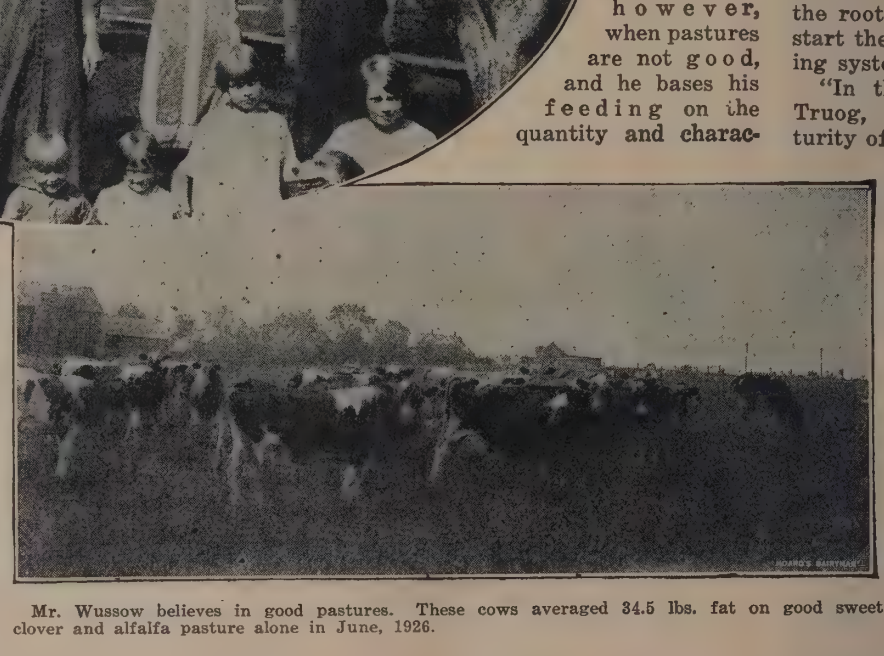
By the time we got to the Wussow farm all the mosquitoes in the neighborhood were having a convention there or maybe it was an athletic event to determine which one could bore in the hardest. Mr. Wussow told us he didn't grow these mosquitoes on the farm, neither did he invite them up around the house. Anyway it was a great day for balky starters, slow leaks, and mosquitoes.

We found Mr. Wussow in the corn field, not cultivating but just tramping around, pulling a weed here, straightening up a hill of corn there, speculating on the prospective yield. Farmers will do this you know on Sundays, and week days when work is not pressing—especially men like Wussow whose hobby is large yields of corn.



He asked us what we thought of his corn and when we truthfully told him it was the best we had seen in a hundred miles of travel to the south he felt encouraged but indicated that prospects were not so good as he would like to have them.

One can tell that Charles Wussow is a good farmer by tramping around in his fields and looking over the farmstead. But to find out facts as to what he and Mrs. Wussow have done and how they have done it required a bit of questioning because he would not tell about their success unless urged to do so. He is quiet, modest, slow to talk but a mighty dependable source of information whenever he speaks.



Mr. Wussow was three years old when his father bought 80 acres of the present 140-acre farm back in 1879. The land was covered with heavy hard wood timber and the present owner learned to swing an ax at an early age in helping to prepare the land for crops. He knows the price of hewing a farm out of the forest. He also knows the satisfaction of being counted among the best farmers in his county though he bears the distinction quietly.

Very little, if any, of present inventory values were made from speculation. About the only speculation they have engaged in was 22 years ago when they bought the farm almost entirely on credit and speculated on their ability to pay for it out of the earnings. Otherwise they have played safe, worked hard, and spent less than they earned.

Cows have been the main source of income. When the timber was being cleared off, the herd consisted of mixed natives. For the past 25 years pure-bred Guernsey bulls have been used. The result is now a herd of uniform breed type and conformation. The herd now consists of some 40 head, 26 of which are pure-bred. Mr. Wussow has been more interested in the production side of his herd and has paid more attention to feeding and weeding than to breeding. He does recognize the value of good breeding, however, and he tries to buy good sires. His present herd sire is Jessy's Danny of Fern Dell. He figures that there is no speculation in feeding and weeding, whereas there may be some speculation in breeding.

Introducing members of the Wussow family. Standing from left to right: Norman, Mr. and Mrs. Wussow, Lauraine, Orville; seated, Carl, Elner, Verona, and Lucille. No trouble with hired help here.

Mr. Wussow believes in good pastures. These cows averaged 34.5 lbs. fat on good sweet clover and alfalfa pasture alone in June, 1926.

At any rate he has depended on the cow testing association to supplement his knowledge of cow management. The result is that unprofitable cows are retired from service and the better cows given every opportunity to do their best. The milking herd now numbers around 20 cows annually. These cows average about 350 lbs. fat. This is not as big an average as some herds show but it is a good money making average, one that pays well for the feeds eaten and a comfortable margin for labor.

The herd average might easily be considerably higher if Mr. Wussow cared to crowd his cows to their limit. He believes in playing safe, however, and would rather have a herd with a good money making average than one including a couple or three cows with high records and run the risk of some herd troubles that may accompany excessive feeding such as bad udders and breeding difficulties.

Mr. Wussow is not a stingy feeder by any means. He makes his cows go the limit on the best roughage combination—corn silage and alfalfa hay. In the summer time he tries to give his cows all of the best pasture they want. Contrary to general practice he pastures alfalfa and as the slang phrase goes, "gets away with it." But he does not recommend pasturing alfalfa to every dairyman because, as he says, "some won't do it right," meaning that there is danger in the practice, especially to careless caretakers. He never turns his cows on alfalfa pasture until he partly fills them on other feeds including both roughages and grain and he never turns them on when the dew is heavy or the alfalfa wet with rain. He has some native pasture to supplement the alfalfa. He has tried sweet clover one year and while he says it may be all right, he prefers to stick to alfalfa until he has further experience. He put in 9 acres of sweet clover and timothy last spring.

His winter grain feeding is simple but adequate. He feeds a mixture of ground corn, oats, barley, and linseed meal. In the summer time, if the pastures are real good, he does not feed grain. He does feed some grain, however, when pastures are not good, and he bases his feeding on the quantity and character of the pasture and on the production and condition of his cows.

With this kind of feeding management he does not have udder troubles in the herd, the cows are regular breeders, the herd is free from abortion and clean from tuberculosis. As an indication of the production he gets from good pasture we asked him for the figures on his herd for the month of June, 1926. During this month 18 cows averaged 34.5 lbs. His best cow made 49.4 lbs. fat for the month. This production was made on sweet clover and alfalfa pasture without grain. Nine of the 18 cows were three-year-olds or under.

Next to his cows Mr. Wussow's hobby is growing corn. He grows other pure-bred seed grains as well. Some 12 years ago he produced 98 bushels on a measured acre with the corn figured on a 14 per cent moisture basis. He practices a 3-year rotation of corn, oats or barley, and clover, with alfalfa breaking in when it is seeded or reseeded. With the manure from the live stock and this short rotation the farm is producing more of crops than a decade ago.

Some 20 to 30 hogs, Chester Whites, are marketed annually and a flock of 125 Brown Leghorn hens contribute to the gross income.

WINTERTHUR KING ORMSBY AIDEE, IMPORTED FROM NEW JERSEY IN 1920 AND STILL IN SERVICE IN THIS 200-COW HERD

THE NEWLY BUILT PLANT AT SAN VINCENTE RANCH FOR MANUFACTURE OF POWDERED MILK

Left—A view of one of the pasture lots from the top of the silo. Center—Jesu Susaeta, manager, and his head mason at the top of a newly built silo. Right—Individual pens for ulls are 60'x12' and each bull has a morning bath and grooming. These young bulls are largely sold at auction at the live stock exposition held at Santiago, Chile, and Buenos Aires, rgentine. Prices will average close to a thousand dollars each for the 20 to 30 sold in this manner, in addition to which many others are sold at the ranch.

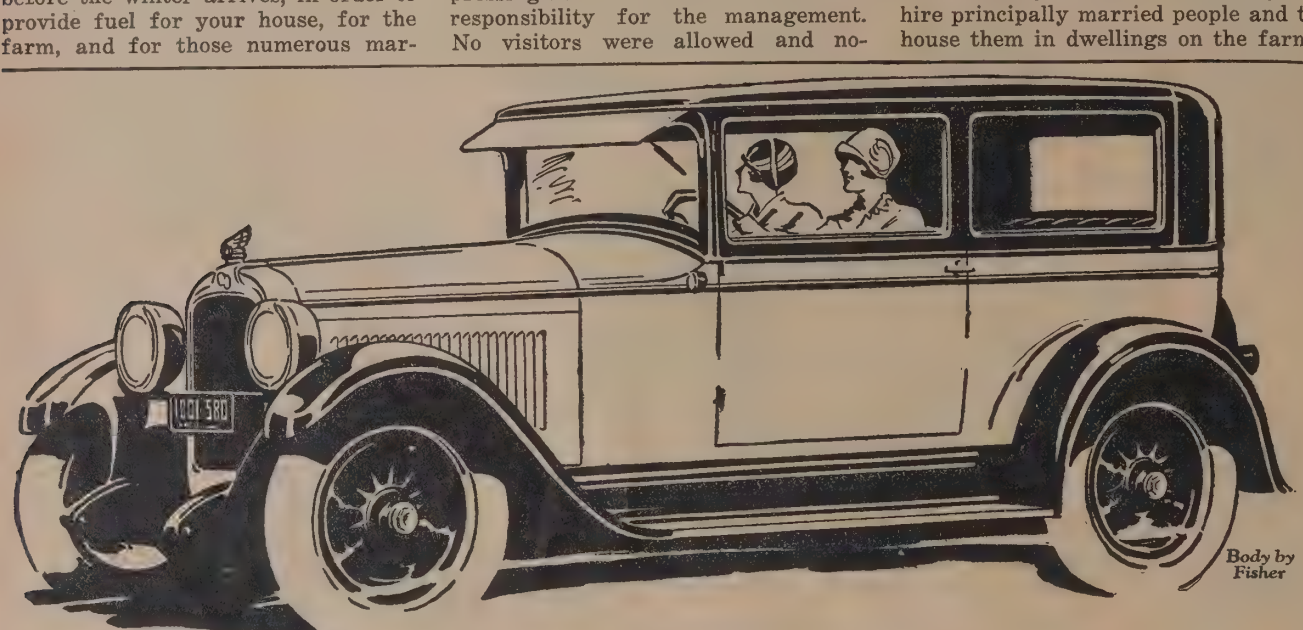
MY EXPERIENCE WITH FOOT AND MOUTH DISEASE

FRANK LAUBNER, PENNSYLVANIA

IT is about twenty-five years ago, when I was running a farm of a thousand acres in the south of Europe, that the foot and mouth disease made again its appearance in our neighborhood. The infected district was put under quarantine and we farmers in the adjoining counties were duly advised by the authorities to use every precaution and to keep our cattle as isolated as possible. Good advice this, when you have to rely for your heavy team work nearly exclusively on oxen and when you must haul 300 cords of wood from your wood lot five miles away before the winter arrives, in order to provide fuel for your house, for the farm, and for those numerous married "servants" living on the farm place. We assumed the risk, hauled the wood, and brought the dreaded disease in our barns before we had finished the job.

Events were now very quickly developing. My report to the state veterinarian was instantly followed by absolute quarantine of the whole big farm, with hired armed guards and burning fires in front of small huts placed at the roads leading to the farm. It was a life very amusing for our numerous "help" but very depressing for the man who carried the responsibility for the management. No visitors were allowed and nobody could leave the farm without having been thoroughly disinfected. This was done in the front of the guards' huts and special precaution was also taken to have the passing members of the big farming community step into a box containing a carbolic disinfectant. It appeared that the outside world was pretty well protected against the bad disease we had in our walls. In the report—black on white—yes, but how in practice?

The particular labor question in that country made it necessary to hire principally married people and to house them in dwellings on the farm. There were, of course, lively boys a girls; and the boys liked, after a ha day's work, to slip through the woo to their best girls on the neighbor farms, and the girls on our farm w secretly visited by their sweethea from outside the farm. None of th boys would risk spoiling his only p of Sunday shoes by stepping i that "infernal" carbolic brew guards on the roads had provided i You see, these are the ways foot a mouth disease was spread at that ti in Europe, and perhaps also el where. Of course, there are num ous other possibilities of spread the disease; by wild and domestic a mals, by dogs, cats, birds; by tra ferring hay, straw, manure, etc.



In our case I observed an erupt of blisters in the mouth of our ox They lost their appetite, showed si of light fever, and a kind of r saliva hung suspended from th lips; there appeared also a swelli redness, and tenderness about feet, especially between the digits every foot, and while not every a mal appeared afflicted, there were animals in every corner of that oxen barn containing sixty animal

The state veterinarian was posted on foot and mouth disease asked my consent for infecting those animals at present showing munity by making small incisions their tongues and by transferri that sickness carrying saliva to healthy ones. He pointed out that doing so we would greatly reduce length of the quarantine duration accepted his program and all but of the oxen contracted the disease. ter six weeks the quarantine was ed after a thorough disinfection of animals and the stalls. We used great success for the inflamed mou of the oxen a wash with a solution honey, wine, and vinegar. For the flamed feet we used an antiseptic lution made up with carbolic acid

This outbreak was a mild one a are generally the majority of breaks of foot and mouth disease Europe. This may be accounted by the weakening of the virus as disease has been circulating mor less for hundreds of years so th large part of the cattle there h perhaps acquired a certain degre immunity. I have seen cases of and mouth disease in Europe whe was hushed up and the disease out without coming to the knowl of the outsider; but these are ex tions.

Foot and mouth disease can be rible. A friend of mine living ir isolated place in Germany, where disease had not been since long ye lost all of his valuable milk cows. was a case of highest virility of infecting germs. The cows with f up to 106° F. lay permanently on floor without taking any wate food and they shed the bony stance of their hoofs entirely. A his cows had to be killed in orde shorten their suffering.

The disease is also known as a fever. It may be regarded as es tially a disease of cattle but h sheep, and goats will take to the ness. Man himself is not immu though the drinking of small qu ties of infected milk may not en ger him. But I can positively s from my experience that the fee of milk from diseased cows has disturbing effects with babies, as t are resulting eruptions of blister the mouths of the children, cau eventually dangerous complicat with feeble infants. The disease r vails in Europe and occasions g losses. Although the actual mort is quite low, there are serious l

Finer than ever in Quality

Lower than ever in Price

Today's Pontiac Six is the finest Pontiac Six ever built. Not merely does it offer the fashionable smartness of Fisher bodies in new Duco colors, but it brings to the buyer those many refinements which have been made in Pontiac Six design since the first Pontiac Six was introduced.

Although the original Pontiac Six was such a revolutionary value that it set a world record in the number of buyers it won during its first year—

—the Pontiac Six you buy today is even smoother in operation, even more sparing in the attention it requires, even more luxurious and more distinguished in appearance!

Yet it sells for less than ever—the result of price reductions made possible by the economies of increased volume production in the world's newest and finest motor car plant.

Unless you have actually driven today's Pontiac Six—actually studied the richness of its Fisher bodies and its exclusive features of modern design—you cannot know what thrilling power and smoothness, what thorough road mastery, and what enduring satisfaction can now be obtained in a six at $745!

$745 2-DOOR SEDAN

New lower prices on all passenger car body types.
(Effective July 15)

Coupe	$745	Sport Cabriolet	$795
Sport Roadster	$745	Landau Sedan	$845
De Luxe Landau Sedan			$925

The New Oakland All-American Six, $1045 to $1265. All prices at factory. Delivered prices include minimum handling charges. Easy to pay on the General Motors Time Payment Plan.

m the diminution of the milk se-
ion and consequent interference
h the business of the dairy.

o far about my experience with
and mouth disease in the old
ntry. Some eleven years ago I was
ling a position as superintendent
one of the largest dairy farms in
New England States. The out-
ak of foot and mouth disease at
time was in the neighborhood of
ton, and we were located about
miles from Boston. Doing busi-
by retailing our milk and cream
near one thousand five hundred
omers in a fashionable suburb we
e all the time in steady competi-
with those big milk concerns,
ading out over large territories
sparing no efforts or money to
ease their holdings on customers.
y used to pay two dollars to their
smen for every newly acquired
quart milk customer. And those
smen have been on the job, I as-
you. Only the special quality of
milk enabled us to stand that
p competition during all the time.

with all our cows gone and un-
going the following quarantine
ur premises for weeks at least,
ld we not risk to lose a large num-
of our old customers forever?
ild it be worth while at all to try

in? This was the situation we
d at that time.

had two major evils to consider.
t, the possibility of bringing the
ase to the plant by our numerous
wagons covering a territory of
e than thirty square miles daily.
ndly, the danger of a direct in-
ion of the cows by coming in con-
with the disease by leaving the
s and by entering the adjoining
ure where stray dogs, cats, birds,
might leave disease carriers. In
r to overcome the first possibility
made an arrangement with our
authorities to run their oil spray
ons daily over our roads. Every-
, and especially the owners of
automobiles, knows the stick-to-it-
ess of those tar-like heavy oils
h are used in summertime on
y roads or for road repairing.
ybody entering our premises had
alk over these black films, which
me from day to day more inten-
and adhesive. Men, horses, wag-
and all had to go through, not ex-
ng two young ladies from our of-
who had to pass over the road
times a day, every time raising
nergetic protest.

y second prophylactic consisted
praying the four feet of every
as she went to the yards. There
at every door a man with a big
ring can provided with a sprayer
e, running a 4% creolin solution
the hoofs of the animals. My idea
to wet those parts of the foot of
ow which are most receptive for
lisease and it would not allow the
se germs to enter.

must confess that I did not con-
any idea how to protect at same
the mouths of the cows. But I
eport that the disease did not en-
ur barns and that we never were
rbed for one day in distributing
products, much to the comfort of
ustomers, especially of the moth-
of babies. The federal authori-
ad also at that time the disease
in hand and the outbreak in our
borhood was promptly stamped

Before you choose a shingle

Try an' burn it!

Re-roof for the last time

Leave the old roof on. Lay these beautiful everlasting shingles right over it. No fuss, no dust, no litter of torn off shingles on the lawn. No danger from rain while the work is in progress.

Then forget your roof. It will be everlasting—no costly repairs. It will be fireproof—you need never fear flying sparks. You re-roof for the last time when you re-roof with Johns-Manville Asbestos Shingles.

DEMAND a fire-proof shingle — not only for its safety, but because it will actually save you money. Before you choose a shingle, "Try an' burn it!"

Even the white-hot flame of the blow-torch cannot harm these beautiful Johns-Manville Rigid Asbestos Shingles. They are more than *fire-resistant* or *fire-safe*. They are FIRE-PROOF.

That's the kind of roof that Johns-Manville now offers you at little more than the cost of ordinary, flimsy shingles. A shingle that means complete protection against roof-communicated fire! A shingle that should never cost a cent for repairs. A shingle that you will never need to replace as long as your home stands.

You will like the interesting, broken line beauty these hexagonal shingles give your roof. They may be laid either side to the weather, exposing the cool gray of one side or the blended autumn colors of the other.

Get this beauty, economy and protection for your roof at little cost. Any Johns-Manville dealer will give you full particulars.

Makes $60 Feed at less than $35 per ton with "JAY BEE" HUMDINGER

Crusher · Grinder · Pulverizer

Emil Westergard, Omaha, Nebraska, saved $150 a month grinding with a "Jay Bee" for 47 cows.

Yoeman Farms, Elgin, Ill. (dairy barn illustrated above) made better feed at less than $35 per ton, with their Humdinger Mill, than they bought for $60. So can you! We will tell you how. Write for our free feeding booklet.

Makes Finest Dairy — Cattle — Hog Feed

The "Jay Bee" grinds any grain or roughage as coarse or fine as you want it ground, at a lower cost per ton than any other mill. It will grind the feed cool. The animals prefer the taste of "Jay Bee" ground feed. The unheated feed will not spoil in transit or storage or be left uneaten.

Red Lady No. 396118, owned by Oakwood Farm, Newton, N. C., gave 19608 lbs. milk, 1028.51 lbs. fat at age of 9 yrs. 9 mos. "Jay Bee" fed.

Oat hulls are completely pulverized—safe for feeding young pigs. No rats' nests in corn fodder or ear corn with husks on, after grinding. Easily grinds such popular feeds as alfalfa and other hays, pea vines, soy bean hay, ear corn, with or without husks on, corn stalks, cotton seed cake, etc., which other mills cannot easily handle.

3 Sizes: 7 H. P. to 30 H. P. Fordson will operate successfully. Easy Payment Plan

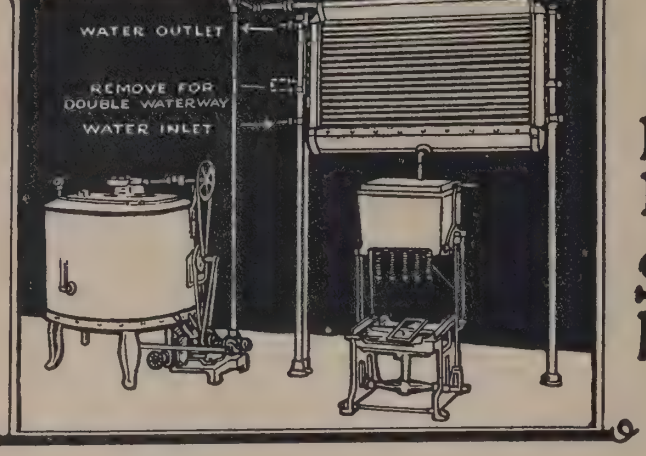
Over 7500 "Jay Bee" mills in daily use. There's a reason! It's the best mill—and cheapest when the work is done. Prompt Service. Stock in all principal cities.

You need a "JayBee" mill. Get one now! With it you can make more feeding profits than by any other method.

The Only All-Steel Hammer Mill

The Humdinger Mill, Bossert made, of boiler plate and manganese steel, is practically unbreakable. Mills in use five years are just as good as when bought.

Nothing to Wear Dull or Break



The Humdinger mill has no knives to endanger fingers, no burrs, rolls, gears nor grinding plates to wear dull, break, cause friction or heat grain. Manganese steel hammers strike feed material only. No metal touches metal. Lifetime service. Lowest operating cost. Greatest capacity—lowest horse power consumption. Repair bills practically nothing.

Eventually all good dairymen and stockmen will own a "Jay Bee" mill to be able to produce the greatest quantity of milk and beef most economically. Write today for descriptive literature.

J. B. SEDBERRY, Inc., 268 Hickory St., UTICA, N. Y.

VICTOR DAIRY PASTEURIZER

for the FARM DAIRY and SMALLER PLANTS

REALIZING the need for a simple, efficient and economical milk pasteurizing outfit for smaller plants and farm dairies, *CP* offers the Victor, illustrated above.

The outfit consists of a combined heater and holder, sanitary pump and Alaska cooler. (Bottle filler is not included, but can be supplied at extra cost.) Operation is simple and conforms with all state health boards' requirements.

With a Victor Outfit the small dairyman can produce good, wholesome pasteurized milk just as cheaply and efficiently as the big city dealer. Pasteurization provides safe milk and will increase your business. The Victor is a business builder. Write for full information and prices.

If Your Dealer Does Not Handle Goods Advertised in Hoard's Dairyman — Ask Him Why!

News from Washington, D.

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, D. C., Aug. 24—In preparation for the big dairy exhibitions this fall, the Division of Exhibits, U. S. D. A., is now building about sixteen or seventeen new exhibit booths and revising and reassembling several others. Twelve or thirteen will be shown at Memphis, one at the Chemical Industries Exposition, and nine at the Dairy Industries Exposition at Cleveland. In the Memphis show a talking exhibit is to be used for the first time, making use of the automatic phonograph and specially prepared records which will give instruction and information on dairy problems and explain recent research results secured by the Bureau staff.

A statement recently issued by Chairman Thomas O. Marvin of the U. S. Tariff Commission indicates that an effort is being made to hasten the work of the commission on pending cases, among which is the milk and cream case in which the eastern dairy industry is much concerned. Chairman Marvin pointed out that the funds of the commission were exhausted before June first by the work which had to be done on the many new cases started during the past year, but now with the new appropriation available every effort would be made to complete the cases now under way.

Canadian newspapers quoted here state that the Canadian government is to enter this year upon an extended program of research to discover new industrial methods and means of developing agricultural and industrial resources. A meeting of the officials of all of the provinces is to be held in October to work out a plan and then the Ottawa government will be asked to finance it. Coming so closely after the announcement here of the effort to secure new funds for cultural research in the U States, this is pointed out as in ing the new trend of activity ir agriculture and industry.

Notice has been issued the week that the annual meeting National Dairy Union will be November 29 at the Nicollet Minneapolis, in connection wit annual meeting of the Na Creamery Buttermakers' Associ

Your correspondent has been brief vacation trip through the sections of Central and Western York, finding weather, pasture hay conditions about as fine as be had. There is less corn, hov than usual, and what there is i spotted, so it is now indicated the ensilage supply will be short of requirements. The sea very late; hay was still being Northern New York and oats parts of the state.

There was evident, more pe than in previous years, a growin couragement among the milk p ers in all but the best located sec Valley dairy farms near n seemed in good condition, with feeling on the part of owner operators, but hill farms, cially with a haul of s miles to loading station or looked run-down and ill kept there were many abandoned Competition of big plants for part of the milk to be had alon traveled roads was putting creameries and cheese factories business in Western New York, ing those not on well traveled without an outlet. There was dissatisfaction with this situatio

Garlic in Cow Pastures

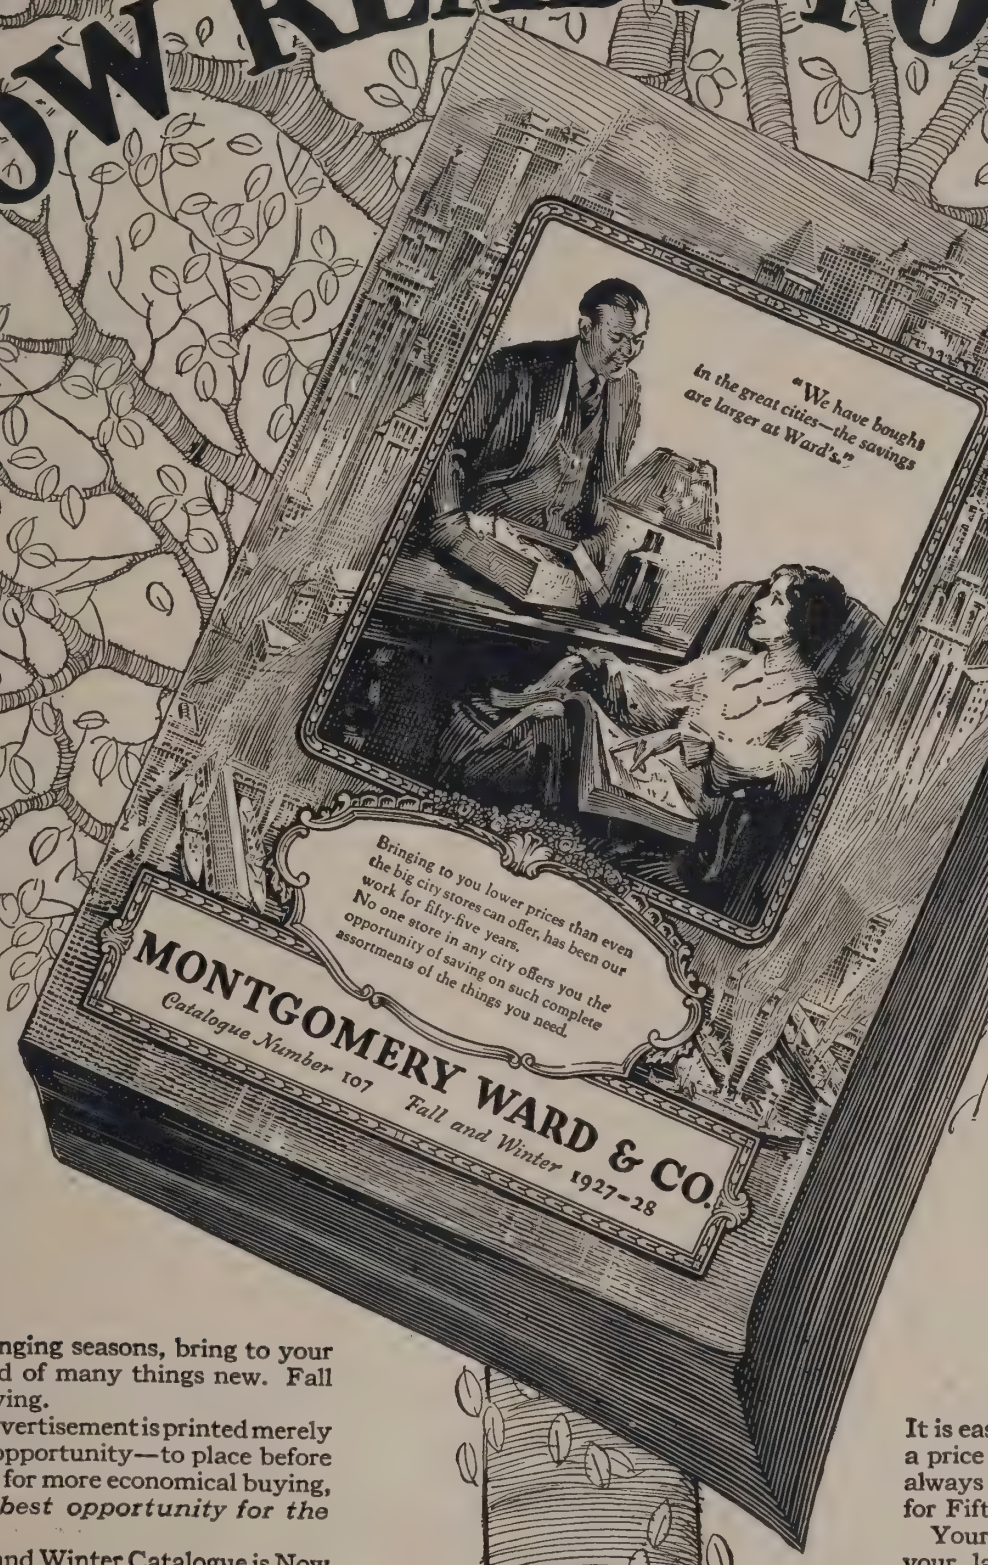
Garlic is bad enough anywhere but in a cow pasture it is worse than that. W. A. Hanning of Southern Indiana has some garlic in his pastures. In spite of this he was solicited by the Evansville Pure Milk Company to produce milk good enough for babies. Hanning took the job and is making a go of it in spite of the garlic.

We asked him how he does it. He replied, "I do not turn my cows on pasture until the garlic is pretty well along and out of the young, tender stage. Cows will eat the young garlic but will not eat much of the older plants. I take my cows off the pasture at least three hours before milking them. I always feed some dry feed with pasture. I aerate and cool my milk immediately after it is drawn, cooling down first with well water to about 52 degrees F., then down to about 35 degrees F. with ice water. I have lots of garlic but have never had a complaint from the milk company that distributes my milk."

Jackson to Wisconsin

H. C. Jackson, manager of the cooperative creamery at Grove City, Pennsylvania, has accepted appointment as head of the dairy department at the University of Wisconsin, succeeding Professor E. H. Farrington who has successfully directed the work for the past 33 years.

Mr. Jackson has been in charge of the Grove City plant, where the laboratories of the U. S. Bureau of Dairying are located, since September, 1924. He is regarded as a very able dairy manufacturing man.



Graduating from Cornell University in 1915, Mr. Jackson continue studies, securing his Masters Doctors' degrees, and instructi various dairy courses at Cornel did considerable extension wo market milk plants throughout York State, studying especially densed and powdered milk man turing plants.

For three successive summe inspected navy butter manufa in Pennsylvania and Iowa and in was employed as efficiency expe a large Philadelphia dairy com In 1924 he accepted a position dairy research laboratories of t S. Department of Agriculture.

WARD'S FALL CATALOGUE NOW READY FOR YOU

FALL—the changing seasons, bring to your home the need of many things new. Fall s the season of buying.

Therefore, this advertisement is printed merely o tell you of your opportunity—to place before ou an opportunity for more economical buying, o give you *your best opportunity for the argest saving.*

Ward's new Fall and Winter Catalogue is Now Ready—is Now Ready for You. One copy is to be ours, free—*if you ask for it*. To have this book n your home is to profit by the biggest bargains—*to save the most by buying the cheapest.*

A $50.00 Saving in Cash Is possible this Fall for You

ver Sixty Million Dollars in cash has been used o secure low prices for you. And cash buys at ie lowest price—always. Bright new merchan- ise has been bought by the train load—to ecure low prices for you. There is for you a aving of $50.00 in cash if you send all your rders to Ward's.

We never Sacrifice Quality To Make a Low Price

It is easy to sacrifice quality. It is easy to make a price *seem low*. But at Ward's, Quality has always been maintained—Quality has come first for Fifty-five years.

Your satisfaction with the goods you buy—your lasting, regular patronage—is our aim. Therefore, we sell only goods of standard, reliable quality. *And in a few years, this policy has brought us over three million new customers!*

You, too, can profit by this *real saving* on goods that give *greatest service*. One copy of Ward's Fall and Winter Catalogue is offered you free. You need merely fill in the coupon below.

The famous Goodyear Pathfinder. Car owners have already bought nearly 5,000,000 of these lower-priced, standard quality Goodyears.

Benefits you may be missing

There's one other big factor in low-cost tire mileage besides the quality of the tire.

That's the care and attention the tire gets after it goes into use.

If you've been doing business with your local Goodyear dealer you know what we mean.

You know he picks out the right size and type of tire for your car, lets you *see* it before you buy, mounts it on the rim, fills it with air.

You know, too, that long *after* the sale he helps you give that tire the care it should have to deliver maximum results.

If you're sending away for tires you are missing the benefits of this service. They're worth having, for they cut tire bills down.

They are mile-saving results of the famous Goodyear policy: *to build the greatest possible value into Goodyear products,* and *to provide facilities so that the user can get all this inbuilt value out.*

Goodyear makes a tire to suit *you*—whether you want the incomparable All-Weather Tread Goodyear, the most famous tire in the world, or the lower-priced standard quality Goodyear Pathfinder

Goodyear Means Good Wear

A Six-year Record Cow

E. A. HANSEN, MINNESOTA

LUCY, MINNESOTA'S LONG-TIME COW

An average of 560 lbs. fat for six years that brought a return of $1,200 over cost o feed is the record of Lucy. She appears here with Ola Larson, her owner, in the cente Tester Bernerd Rosenquist at the right, and her feeder and milker, Mr. Larson's son at the left.

LUCY, a grade Holstein, owned by Ola Larson of Todd County, Mi nesota, has recently completed her sixth consecutive testing yea Her record is the largest long-time record reported. This perform ance is noteworthy because it was made under everyday farm conditio by a man who makes his living by milking cows. Lucy was milked thr times daily during a part of each of the three last lactation periods. He feed consisted of silage, alfalfa, and mixed hay, corn, oats, bran, oil mea and pasture. The records were supervised by six different cow testers.

LUCY'S 6 YEARLY C. T. A. RECORDS

Year	Milk	Fat	Value of product	Feed cost	Income over feed cost
	Lbs.	Lbs.			
1921	9,051	418.3	$186.38	$59.65	$127.23
1922	12,244	540.4	231.23	61.51	169.72
1923	11,941	504.2	265.80	60.80	205.00
1924	14,842	604.5	302.39	80.33	222.06
1925	17,328	745.2	381.90	97.83	284.06
1926	13,673	545.8	257.68	75.49	182.19
Total	79,079	3,358.4	$1,625.88	$435.61	$1,190.26
Average	13,179	559.7	270.98	72.60	198.37

The above yearly records are for cow testing association years endi January 31 of each year. Lucy's best yearly record on the basis of 365 da was for the lactation period starting December 7, 1924, and ending D cember 6, 1925. Her record for this period was 19,003 pounds milk, 800 pounds fat. During this time Lucy consumed 8,730 pounds silage, 2,0 pounds hay, and 4,930 pounds of grain composed of corn, oats, bran, a oil meal, the total cost of which was $105.21.

Certain Weeds Useful for Man or Beast

The definition of a weed which states that a "weed is a plant out of place" will include many useful members of the vegetable kingdom. The Russian thistle, for instance, though chiefly a pest in Colorado, is used for hay in dry years when other forage crops fail. The large roots of the Canada thistle were at one time eaten by the Indians, and they are said to be used for food in Russia.

Quack grass, one of the worst weeds of cultivated land in Minnesota, makes good pasture for horses and cattle when it gets enough water to grow rapidly and to keep tender. Dandelions are used in much the same way as spinach in the spring, and medicine is made from the roots and flowers.

A number of Colorado weeds contain small percentages of rubber and may in the future provide some of the rubber for commercial use. Many weeds of the grass family provide acceptable pasture when they are young and become inedible or harmful only when they are mature. The presence of weeds along roads and banks stops washing of ditches and the wind erosion of the soil.

Common yarrow, agrimony, qua grass, toad flax, red poppy, gr te plantain, knotgrass, and sorrel a now or have been used for medi a purposes. Bent grass, sedge, chi ry common wild morning glory, im tory, avens, bracken, and comm nettle have been used for fodd i various places.

Chicory, borage, Star-of-Be le hem, salad burnet, sorrel, com o sow thistle, bladder campion, da de lion, common nettle, and seeds o th black bindweed are used in diffe en ways for human food. Agrinny borage, gold-of-pleasure, sedge, na d ow saffron, goose grass, ladies' ed straw, wood-wax, toadflax cinqu oi broadleaved dock and common rtt have been and are used in many a in the arts and industries.—CHAL F. ROGERS, Weed Control Work, Col orado Agricultural College.

A homesick Irishman had got jo as crossing guard for a railroad. Th foreman handed him a red flag an green flag, and told him, "Whenve you see a train coming, get outan wave this red flag."

"Git away wid ye job!" exclaime Pat. "Me wave a red flag whe O got a grane one handy! I'll s rv first."

for Economical Transportation

CHEVROLET

Consistent Progress and Proved Design — have resulted in the most *Amazing Quality* in Chevrolet History!

Today's Chevrolet embodies the most amazing quality in Chevrolet history—the result of 14 years of consistent development and improvement.

In carrying out this policy of consistent betterment, the Chevrolet Motor Company has profited immeasurably from its close association with the General Motors Corporation—the world's greatest producer of automotive products.

The General Motors Research Laboratories, under the direction of the most famous scientific staff in the automotive industry—

—the General Motors Proving Ground, the greatest outdoor testing laboratory in the world—

—the General Motors engineering staff—

—the vast General Motors resources—

—all have been constantly utilized in making Chevrolet the world's finest low-priced automobile!

Go to the display room of the nearest Chevrolet dealer and see today's Chevrolet. One inspection of its custom beauty, one ride at the wheel of your favorite model—and you will know why thousands are investigating the market each day . . . and turning to Chevrolet!

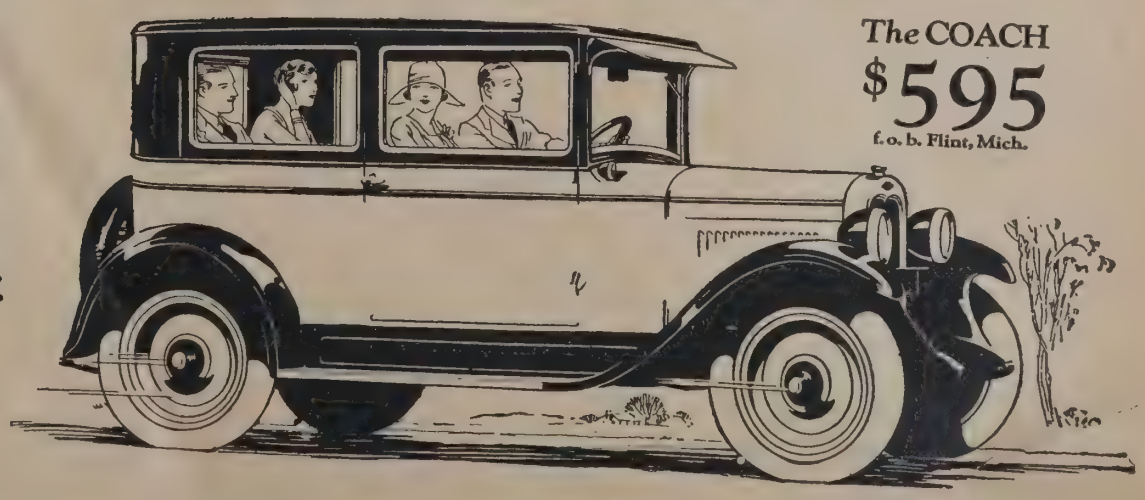
Check Chevrolet Delivered Prices
They include the lowest handling and financing charges available.

The vast resources of General Motors and the tremendous manufacturing facilities of Chevrolet have made possible this amazing quality.

GENERAL MOTORS

The Chevrolet Motor Company is a unit of the General Motors Corporation — the greatest automotive organization in the world. Utilizing the vast resources and engineering facilities of this organization, Chevrolet enjoys, to the fullest extent, these manufacturing advantages—a fact that is largely responsible for Chevrolet's amazing values.



PROVING GROUNDS

The General Motors Proving Ground comprises a tract of 1245 acres. The entire tract is criss-crossed with roads of every type—from a concrete speed track, to deep-rutted clay lanes. There are hills that vary in steepness from a slight inclination to 24%. Fleets of Chevrolet cars are under constant test at the Proving Ground—driven day and night under every conceivable condition of road and load.

TWELVE GREAT FACTORIES

Chevrolet cars are manufactured in 12 great factories, located at strategic shipping points throughout the country. Every factory is equipped with the most advanced modern machinery known to engineering science—performing every manufacturing operation with exacting scientific precision and maximum efficiency.

QUALITY AT LOW COST

The Winning Name for Lee Buttonless Work and Play Suits is WHIZIT

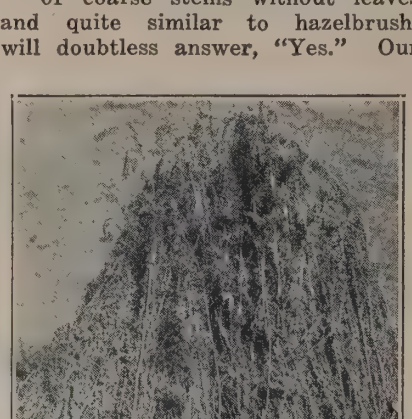
FROM thousands of suggestions this name has been selected to represent the already famous Lee Buttonless Work Clothing. From every state, indeed from every county, the names came indicating interest beyond our expectations. The convenience, durability, appearance and time-saving features of the new Lee garments with the Hookless Fastener, have won nation-wide approval. Thousands of working men have put them to the test and found them easy to put on or off and remarkably long wearing. Thousands of Mothers have saved time and trouble by dressing their children in the new buttonless play suits. Ask your nearest dealer to show you LEE WHIZIT UNION-ALLS, OVERALLS and PLAY SUITS.

THE H. D. LEE MERC. COMPANY
Factories: Kansas City, Mo., Trenton, N. J., South Bend, Ind., Minneapolis, Minn., San Francisco, Calif.

Lee Union-Alls, Overalls and Play Suits are also available in styles having buttons instead of Hookless Fasteners.

The winners in the Lee Prize Naming Contest were chosen only after consideration was given to every entry. Each prize was awarded on the basis of the name submitted together with the reason for the choice of the name. The Lee Company wishes to thank the thousands of persons who submitted names, for their interest in the naming of the new garments.

First Prize, $250—Geo. W. Mock, Seattle, Wash.
Second Prize, $125—Mrs. William Gallup, Casselton, North Dakota.
Third Prize, $75—Mrs. Mildred Steele, Elkhart, Indiana.
Fourth Prize, $50—Mrs. G. F. Ross, Brockton, Mass.



One Hundred Prizes of $5.00 each awarded to the following:

J. Corry Baker, Pueblo, Colo.
Don H. Davy, Burlington, N. D.
Dean Hartzell, Klamath Falls, Ore.

Clarence J. Millhaubt, Wichita, Kans.

MAKING SWEET CLOVER HAY

L. S. GILLETTE, IOWA

IS sweet clover hay a myth? People who have seen a collection of coarse stems without leaves and quite similar to hazelbrush, will doubtless answer, "Yes." Our agricultural college people, at least the Farm Crops Department at Ames, have not been recommending the use of sweet clover for hay, and farm sentiment in many sections of the country is quite adverse to attempting sweet clover hay.

CURED IN THE BUNDLE

These bundles have been cut open to show the quality of sweet clover hay, resulting from the bundle method of harvesting. This is from last year's crop on the Gillette Farm that stood out for two weeks of rainy weather in shocks of three to six bundles. Despite the bad curing weather the leaves did not shatter and the quality of the hay was good.

After trying in vain for a number of years to produce sweet clover hay through the use of a mower, we turned as a last resort to the binder. It is entirely practical to so use a binder and fine hay is produced with less work than the old way,—and it saves the leaves! Sweet clover hay cured in this manner is relished by the cows. Last winter when a neighbor and former president of the County Farm Bureau visited our barn and observed how the cows cleaned up sweet clover hay, he said: "Your cows do not leave any more stems than my cows do with alfalfa." Our cow tester advises that our cows clean up their hay equally well as the cows in the association fed alfalfa or other hay.

Sweet clover hay will yield two tons per acre the first cutting. Using the binder leaves the stubble in good shape for a second crop of hay or a seed crop. In cutting sweet clover for hay the time is an important consideration. In this Northwest section of Iowa, sweet clover may be cut for hay—ordinary seasons—June 15 to June 25. The most favorable time to cut is after the heads start to shoot well and before the plant starts to bloom. The height to cut depends very largely on the thickness of the stand, but the stubble should be left high enough to leave a few leaves on each stalk. This is important if the second crop is to be secured. As a general rule, the earlier the hay be made, the lower the stubble may be cut.

Harvesting sweet clover for hay with a binder has its disadvantages. If you don't believe it, ask the man who runs the binder. However, it can be done with fair speed, especially if the driver be not too greedy in taking a full cut. In the old world where oxen furnish the power for binders on many farms, the harvester company uses a larger wheel on the drive chain to speed up the canvasses and packers. If this wheel be used with horses in sweet clover, little trouble will be experienced after the nature of the work is appreciated.

Quality of the hay is affected by the shocking. The first year we used long shocks exclusively, three bundles on a side. Sometimes the bundles mold in the center where six bundles are used in a shock. Better hay is indicated when three or four bundles only are put in one shock. Last year it rained for nearly two weeks on our sweet clover hay after it was in the shock, yet the quality of the hay is good. From the illustration you will note the leaves; they are on the stem.

Through the use of three-rope slings the bundles may be put in the barn,—most men would rather handle the bundles than the loose hay. If a little care is used in loading the sling, little trouble will result, though if the sling is unbalanced the bundles will largely be found in the hay rack instead of the barn.

A neighbor secured a nice crop of sweet clover hay last fall after his oats had been threshed. The first year's growth does not shatter like the second, is finer stemmed, and may be mowed and cured in the usual way.

Trouble has been attributed to sweet clover hay in feeding cattle, especially where the sweet clover furnishes the only source of nutriment. In such cases, the blood of the animals feeding on sweet clover seems to lose the power of coagulation, allowing animals to bleed to death. On the average dairy farm cattle are never fed only one thing. Where plenty of variety is allowed, it is doubtful if any deleterious effect will be observed, while the sweet clover furnishes a very desirable source of nutrients, notably protein and ash. Dr. Schalk in Circular No. 27 of the North Dakota Station states: "There is no evidence of such disease (hemorrhagic) from feeding on good, clean, well preserved sweet clover hay and silage," and, further, "Not all specimens of spoiled or damaged sweet clover hay and silage cause the disease." Further, the indications are that the disease does not develop from sweet clover pasture.

The evolution of sweet clover has been slow, and the value of the plant for farm purposes is not yet fully appreciated. I can recall when walking with my father, some years ago, he stopped to pull up a sweet clover plant and said, "Son, that's a bad weed. Don't ever let it get started. In 1925 we had over 175 acres in sweet clover. It has only been a few years ago that my good friend McCandlish, then professor of Dairy Husbandry at Ames, writing in answer to an inquiry concerning best variety of sweet clover to for pasture, said: "If I could be suaded to use sweet clover at a would be the biennial white." Th now the prevailing variety sown our community two of the first to use sweet clover for pasture me they were likely to be disinh ed for doing so.

SHOCKING SWEET CLOVER

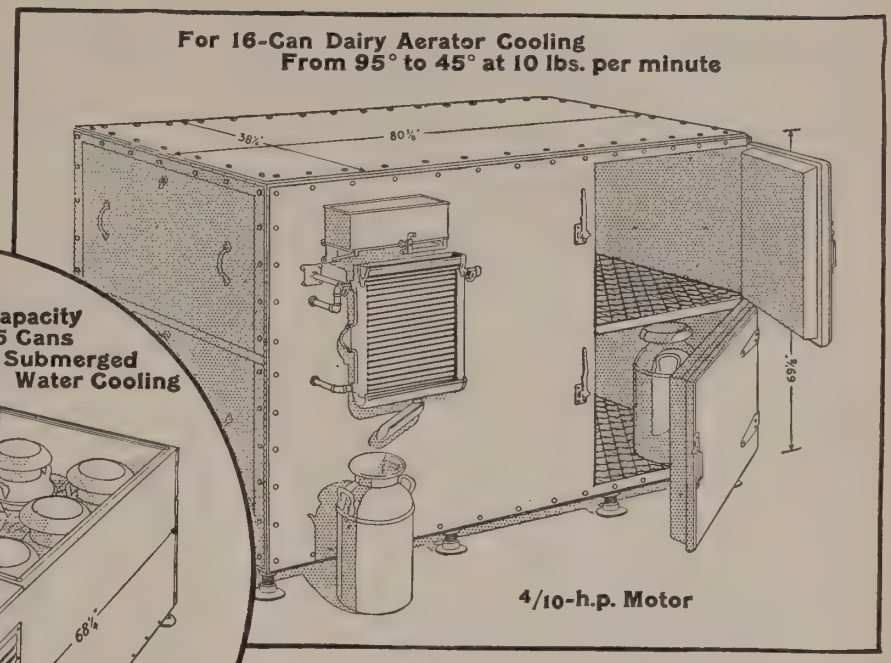
Shocked in the manner indicated above, the sweet clover will be liable to mold in the center. The best shock is of three or four bundles, but it may be shocked in the amount contained in one dump of not over six bundles.

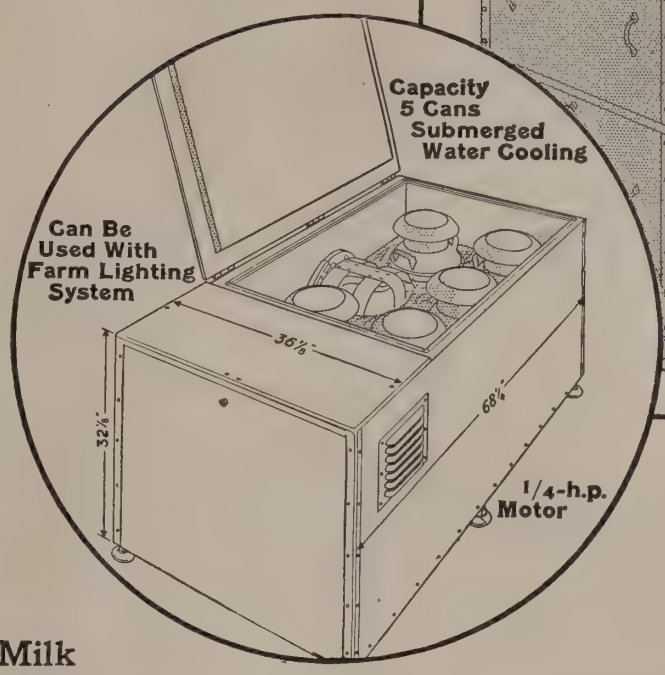
Some folks who are seeding s clover are inexperienced with it apt to be disappointed. While s clover is a hardy, vigorous plan does not thrive on an acid soil. V lime is not essential in this sec yet sweet clover will grow much ter if the ground be given an app tion of ground limestone, as denced by the growth along drains where limestone has thrown out.

In the spring of 1925, the Far Elevator at Spencer, Iowa, sold 20 tons of sweet clover seed. selling agencies brought the totaf the county to over 50 tons, or re ly about 200 lbs. to the section. ten pounds per acre, a gene seeding that indicates twenty per section, not a large an taken as a whole, and yet whe recall that ten years ago practi none was used, the increase is r Sweet clover is the most widely and most important of all leg used in this vicinity, and the has not yet been reached.

Marketing Farm Anim

Many students of live stock b ing as also producers of market mals have a copy of "Plumb's T and Breeds of Farm Animals" a their collection of books. This v an champion of live stock imp ment from the Buckeye State has tributed a new book to benefit farm animal industry, the tit which is "Marketing Farm Anim The substance of the book comes many years of teaching at Ohio University. Its primary purpo that of guidance in class room struction. Producers of live s however, will find it interesting instructive. Copies may be se from Hoard's Dairyman Book partment. The price is $3.00 post





JAMES B. BALL

Mr. Ball, until recently a member of the staff of the Department of Animal Husbandry, University of Illinois, has been employed to take charge of the field work of the Illinois Holstein-Friesian Association with headquarters located in Chicago. This position was made vacant by the resignation of E. M. Clark who is now Marketing Specialist with the Holstein-Friesian Association of America Extension Service.

In the Show Ring of Dairy Equipment

he center of interest nong dairymen, today, is izer-Kelvinator Electric ilk Coolers. Not since e separator and the ilker has any equipment startling in savings, onomies and conven- nces been shown. A new ampion in the equip- nt line! A new winner nerever it is shown!

zer-Kelvinator Electric Milk olers do away with trouble- ne ice harvesting. No further ed for ice houses. No worries out iceless winters or hot sum- rs. They save you from milk ections on receiving station tforms. Save you money, rry, work and trouble.

For Any Dairy Farm Need

o sizes and types make zer-Kelvinator Coolers fit any dairy farm need. There is an aerator cooler, which may be used with or without water, for dairy productions up to 16 cans. A water submersion type cooler takes care of cooling up to 5 cans. The smaller type may be connected to a farm lighting system. Both are rugged and durable — built to stand rough handling in actual farm use.

Dairy Farm Tested

Nizer-Kelvinator Electric Milk Coolers have been thoroughly tested in actual dairy farm use. They are proved good. Backed by the reputations of the two foremost pioneers in the electric refrigeration industry.

Your Milk Dealer Handles Them

Ask your milk dealer about them, or you can obtain them from most Kelvinator Dealers. If you prefer, write direct to any Nizer branch. A fully descriptive folder will be sent you.

EDITORIAL COMMENT

THE cry of "hard times" goes up continually. Many farmers are uttering it and laying the blame on everybody and everything but themselves. A great source of hard times is the fearful leaks on the farm. One can see everywhere wasted land, wasted fodder, wasted time in attendance upon wasted cows, the practice of wasteful methods, and worse than all, wasted manure. Lots of preaching and praying are needed on this subject of waste.

THE American Dairy Science Association which held its summer session at the Michigan State College, recommended changing the name "cow testing association" to dairy herd improvement association. We look with favor upon this proposed change as it is more dignified and more clearly defines the work of the cow testing associations. It also eliminates confusion with tuberculin testing which is not uncommon. The cow testing association is making such a substantial contribution to dairy progress that anything that will add dignity and develop it should be supported.

WOULD REPEAL OLEO LAW

A. M. Loomis, secretary of the National Dairy Union, says that the National Association of Retail Grocers has apparently been enlisted to assist in the repeal of national laws which compel oleo manufacturers and dealers to sell their product on its own merits. This association passed the following resolution:

> *"Resolved,* that the National Association of Retail Grocers is opposed to the oleomargarine taxes that are imposed upon retail dealers for the privilege of selling that article of food; and that we do hereby petition Congress to repeal such tax law as soon as possible.
>
> "Elimination of special product taxes. The taxation of special products, such as oleomargarine, soft drinks, and tobacco products, is unjustifiable discrimination and should be prevented. The more so if it is a cloak for suppression as in the case of oleomargarine."

It seems strange the National Association of Retail Grocers did not pass a resolution asking for the repeal of laws which govern the manufacture and sale of renovated and adulterated butter. These butters are taxed and for the same purpose that oleomargarine is taxed.

It is well for the dairy industry to be alert to its interests, for unless it is, laws governing the manufacture and sale of oleomargarine may be repealed. It is not necessarily justice that the National Association of Retail Grocers seek.

CO-OPERATION AND FARM ORGANIZATION

The National Grange is an organization that renders sound service to its members. It stands for high ideals in farm life and demands justice for agriculture. To accomplish these ends it holds to principles and practices which are sound. It does not engage in the discussion of issues incapable of being of genuine service to the development of farm life and a sound agriculture. Its present master, L. J. Tabor, devotes himself industriously and intelligently to the work of the National Grange and we take pleasure in quoting his views concerning the value of co-operation and farm organization:

"All admit there is a farm problem that needs correction. A great majority of thinkers will agree that the co-operative movement has helped in the past, is of value at present, and can be made of greater value in the future.

"When we pass the time when more than fifty per cent, or a substantial majority, of our farmers hold membership in *bona fide* farm organizations, with intelligent and capable leadership, we shall witness the passing of the farm problem because the men who fill the nation's bread basket can, by organization, education, and co-operation solve their own difficulties and will have sufficient influence in public affairs to secure any needed remedial legislation or governmental assistance required for the advancement of their own calling."

TARIFF PROTECTS DAIRYING

In an address before the Illinois Agricultural Association, Senator Kenneth McKellar of Tennessee said:

"Agriculture is the only great American industry which is not benefited and protected by federal legislation. All our laws unite in bringing about an adequate return on capital. Immigration and tariff laws help labor and industry. The Esch-Cummins bill provides for the railroads. But the farmer must buy in a protected and stabilized market and sell in an open market with the law of supply and demand in full force."

It occurs to us that some of these statements by Senator McKellar need modification if a true understanding of federal legislation is desired. He says: "Immigration and tariff laws help labor and industry." It should be understood that dairying, which represents one-fourth of the agricultural income of the nation, is well protected by the tariff. There is a tariff of 12 cents a pound on butter or $240 per ton. The tariff on cheese ranges from 5c to 7.5c per pound, or from $100 to $150 per ton. The dairy farmer, the past few years, has benefited to the full extent of the tariff on his products, and similar facts can be demonstrated as to other agricultural products.

It is misrepresentation of facts for Senator McKellar to say: "Agriculture is the only great American industry which is not benefited and protected by federal legislation."

MARKETING BUTTER

When the Land O' Lakes Creameries, Inc., started six years ago, only 32 per cent of their butter could be marketed under a brand. In 1926 over 70 per cent of their butter sold as Land O' Lakes. This organization has been influential in improving the quality of butter but it is difficult to say just how much more the farmers have received for it. In being able to sell their butter under a brand, opportunity has been given to advertise it which has assisted in enlarging its market. Through organization they have directed butter to markets that would pay a higher price and have prevented an oversupply in any one of the primary markets. They have improved the method of distributing and selling butter which has undoubtedly raised the price of all butter. They have had sufficient volume so that the butter they stored during the peak of production had a most wholesome influence upon stabilizing the price. All these things have been extremely valuable to the dairy industry and have without doubt influenced the price of butter upward and have made it possible for all creameries to receive a better price.

Large and efficiently operated creameries outside this organization have profited and have been able to secure better returns for their patrons because of the work of the Land O' Lakes Creameries, Inc. Because these creameries have profited it should not for one moment be considered that they are more efficient or that the Land O' Lakes Creameries, Inc., is not rendering a most useful service. It is incorrect reasoning to hold that there is greater opportunity for a creamery to remain out of an organization than it is to join it. We do not expect all co-operative creameries to join the Land O' Lakes Creameries, Inc., but we do believe it is better for co-operative creameries to join this organization than for Wisconsin or Iowa to form similar organizations and in this way create unnecessary competition. It is of tremendous advantage to the butter industry to have a large volume of butter marketed co-operatively. Grading butter, selling it under a brand, preventing gluts in any one market, the improvement of quality, the storage of surplus during the peak of production, and many other things which can be done collectively are most valuable and helpful in securing good prices for butter. To measure the value of an institution wholly by price is to overlook the fu mentals in co-operative marketing.

We look forward to the time when a suffi number of co-operative creameries have j the Land O' Lakes Creameries, Inc., so that wh shipload of butter comes in from foreign na the entire lot can be purchased. Invariably the ter market declines from 3 to 5 cents a pound a report is circulated that a shipload of butt on its way to this country. It may not enough butter to last New York City 24 hours depressing the price of butter for three or days or more often costs the dairy industry sands of dollars and the consumer receives no fit by lower prices.

Co-operative marketing conducted on the p basis will give the dairy industry an opport to stabilize prices and to market its produc best advantage.

COLLEGIATE EDUCATIO

Fathers and mothers who may perhaps be s what concerned in regard to sending their and girls to college and scarcely feel they ca ford the drain upon the family pocketbook, well reflect upon what Dr. Faunce, preside Brown University, said in a commence address:

"Our common belief that college training is ed to every boy and every girl for college is o the truly great tragedies of American life.

"Colleges do not create capacity for unders ing; they demand it. They are not designed fo purely practical-minded, nor for the youth wh sires merely to do rather than to think and o prehend.

"It is no disgrace to be of the non-college t that is, not of the type for which college i signed. Not every man is suited to be a lawy a doctor, or a machinist, or a miner. Then should we believe that every boy born unde sun, with enough money to pay his tuition, is u ed to be a college student?

"A father told me, 'My boy must be quee doesn't like college.' In this standardized age, we need are queer men. Give us more of te Men who dare to be different, who dare to r tion, who dare to get from the beaten patha blaze new trails of their own."

We believe too many boys and girls are i sent to college. This does not mean we are off too much education or that too many student preparing themselves for the many duties of We are in need of all the trained minds and h that can be secured, but being sent to college not necessarily mean that the boy or girl is usefully trained. It is a waste of time for boys and girls to be sent to college for they a not the types of minds which can be improv the courses of study now offered by colleges. Mo over, a large number are injured rather h helped by trying to give them a training for w they are not fitted.

If boys and girls were required to earn a siderable portion of their college expenses would be a smaller number attending college those not adapted to receiving the present c education would be eliminated. We are in y pathy with making it easy for all boys and i to obtain the kind of education that is to t taste and that will make them more useful zens. It is our belief that, in most instances, graduation from high school it is well to re these young people, if they desire more educ to bear some of their expenses of college. It great hardship for a student to work his w through college. When he does, his time there is not wasted and the institution that d cates him has made a good investment.

Parents who may be somewhat disturbed be they do not feel financially able to send their h dren to college or because they do not care t tend, need not worry about the situation. If children are college timber they will find a w attend and if they are not, there are many opportunities open to them.

Value of Oat Hay

What is the value of oat hay for dairy cows? Is superior to timothy? At what stage must it be t to obtain best results?
Baring, Wash. R. C. B.

According to average analyses, 100 pounds of t hay will contain the following digestible nutri-ts: 4.5 pounds of protein, 38.1 pounds of carbo-drates, and 1.7 pounds of fat; or a total of 46.4 unds digestible nutrients. This hay will be su-rior to timothy for feeding dairy cows because contains over one-third more protein. This will d particularly true where protein feeds are high price and difficult to secure. Ordinarily carbo-drate feeds, such as corn and barley, are rela-ely cheaper in price than protein feeds, such as ten and oil meal, which are necessary to supple-nt rations of corn silage and timothy hay.

Clover and alfalfa hay are superior to oat hay, mixed timothy and clover is practically the ne in feeding value as oat hay.

To obtain the best quality of hay, the oats uld be cut when in the flower or when the grain in the early milk stage. If left until a later ge, the stems and leaves become somewhat re indigestible and are less palatable. Also the tein content is somewhat less where the grain llowed to practically reach maturity. The addi-n of powdered sulphur at the rate of three to pounds per load will overcome the danger of e working in oat hay or in oat sheaves. At st a number of our readers have recently so ad-ed us.

Testing for Abortion

fter making a blood test in the herd and find-a few cows positive, we sold to the butcher all poorer cows; the rest we kept, knowing that rtion could be controlled and perhaps wore out. we took all the precautions prescribed by our t efficient veterinarian who is held in high re-e by all the good breeders of dairy cattle in country. One phase of the routine was a semi-ual blood test.

lthough we took all the precautions and per-ned them faithfully and thoroughly, the abor-continued to spread. The point I wish to bring is this: no cow was allowed in the stable at ing time or after, until she had ceased to dis-rge and had been cleaned up properly. While solation they were kept in box stalls in the e barn. These stalls were thoroughly disinfect-nd offered complete isolation. Under the cir-stances things ought to have gone right, but weeks to two months after taking blood test a case would break out.

was puzzling for some time, nevertheless I abled on the following solution, or rather sup-tion. The blood tests were made in the stan-ns at which time positive cows that were clean not likely to be spreaders stood in their usual es. In taking the blood samples, more or less d found its way in the feed troughs and each of blood carried innumerable abortion ba-Since the germ must be taken in with food rink to cause the infection, what better as-nce for spreading the disease could one want to put the blood of a positive cow in the feed gh for the negative cows to eat?

e result was that from six weeks to two hs after the test, new cases developed. The test developed three new cases, all of which l next to positive cows and on the side in which tion the feed troughs were swept out.

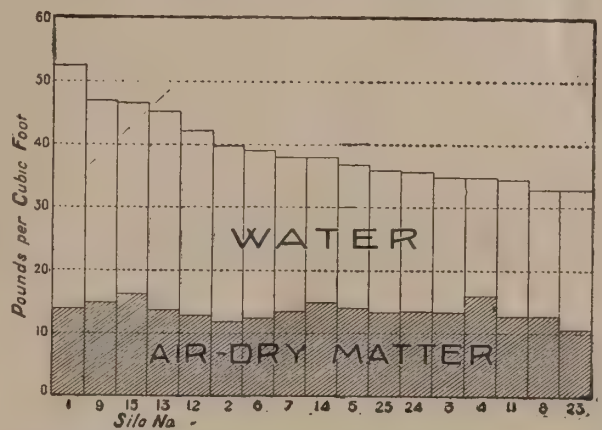
course you are going to tell me that we ld have disinfected the feed troughs or man-or have tested the cows somewhere else. We y enough to do that now and the reason I am ing this is so the rest who are doing this same g in testing will do otherwise.

hat I would like to know is why veterinarians have done so much conflabing about the care treatment of abortion cows haven't recognized mportance of caring for the blood from cows taking blood samples.

ewark, Del. L. M. L.

. George H. Hart of the University of Cali-a has given us the following reply to this nunication:

he owner was apparently trying to clean up tion by isolating on the same premises the ing animals that were too good to sell to the ner. In general, this has not proved to be suc-ul. We have been trying it out here on the ersity Farm herd and although we are able to y out the procedure better than could be done e average farm we, nevertheless, had two re-s the other day after 15 months of testing.



There the reactors are kept on separate prem-or are disposed of immediately, very good re-are following the use of the agglutination It must be recognized, however, that for sev-tests following the first one a few reactors will be found and in general it is necessary to have five or six tests taken one to two months apart as long as reactors are found before they will all be removed. It is not surprising, therefore, in this case that from six weeks to two months after the first case new cases were found.

"This man has made the peculiar observation that the positive cows developed on the side in which direction the feed troughs were swept out and he draws the conclusion that the blood was the carrier of the infection. The surest way to produce abortion in a pregnant cow is to inject her intravenously with abortion bacilli. In general, however, abortion bacilli do not circulate in the blood. They undoubtedly gain access to the blood stream but are soon filtered out and remain concentrated in the lymph glands, udder, or placenta tissue.

"It is possible that occasionally blood from the jugular vein might contain abortion organisms and, in general, we would advise cleaning up the mangers with disinfectant after blood samples are drawn even though this merely consists in wiping up the drops of blood with a sponge wrung out of disinfectant solution. We do not believe, however, that this is a source of infection to be reckoned with."

Estimating Weight of Silage from Tables

In the July 10 issue of Hoard's Dairyman, Mr. Greene gives the results of weighing the contents of ten silos and compares the figures with the estimates as made from tables designed for estimating the capacity of silos. The general result was that the silage weighed about 25 per cent less than the amount as estimated from tables which have been used more or less for this purpose. The editor has asked me, as the senior author of the publication in which the tables are found, for my comments on the subject.

GRAPHICAL REPRESENTATION OF THE RELATION OF THE WEIGHT OF SILAGE PER CUBIC FOOT TO THE WEIGHT OF AIR-DRY MATTER CONTAINED

First of all the authors are the last to claim any great accuracy where the table in question is applied to a particular silo. In the original publication occurs the following statement: "Under any conditions estimating the weight of silage from the volume is so uncertain that when silage is sold it is best when possible to depend upon weighing it as removed from the silo rather than upon any estimation made according to volume." Although the authors in taking the weights of the contents of 32 silos, extending over five years, found no such variations in weight as reported by Mr. Greene in the 10 silos, the contents of which he weighed, we understood fully the impossibility of preparing any figures that can be relied upon in more than a general way. The present writer receives many inquiries regarding estimations of silage weight from the volume. The answer always advises weighing the silage if possible, using the tables only in case one is willing to run the risk of some chance of error.

What is Behind the Tables

We owe a large part of our knowledge regarding silos and silage to Professor King whose remarkable work at the Wisconsin Experiment Station began about 1890. Professor King reported silage to have an average weight of 42 pounds per cubic foot. Tables were published in 1891 and 1893 for use in estimating the capacity of silos. At that time corn was put into the silo in a greener condition than now and as a result his figures were later found considerably higher than the actual, especially when applied to the total volume of the silo as was often done by silo manufacturers some years back. For instance, a silo 16x36 was rated by some at 154 tons. As a matter of fact, a 36-foot silo generally contains not more than 28 feet of settled silage and usually not over 110 tons of silage.

Noting the tendency of the King figures to overrate the capacity of silos, the authors in 1914 began taking records of the weights of silage. A plan was devised for taking the weights foot by foot from the top to the bottom of the silo. Such data was taken on 25 silos, many of them throughout the depth, others only at intervals. In addition, data were taken from five filled with sorghum and three with kafir corn. Five seasons were included in getting the figures used. The material is published in full in Bulletin 164, Missouri Experiment Station, and Bulletin 222, Kansas Experiment Station. One of these publications should be consulted by anyone interested in the many details of the investigations. The table in question is designed to apply only to silage thoroughly settled and does not include loose material on top of the silage,—only the actual silage after the spoiled on the surface is removed.

Variations in the Weight Found

In the 25 silos studied the variations in weight per cubic foot were from 32.7 pounds in a silo containing 15 feet of silage to 52.2 in a certain depth silo filled with rather green corn. The average weight per cubic foot was 39. Fifteen of the 25 were within a range of five per cent either way from the average. It was found, as might be expected, that the moisture content and the proportion of grain were the chief factors determining the weight although the diameter of the silo has some effect. In a smaller size the greater wall surface in proportion to the contents probably tends to lower the weight as a result of more friction from the wall during settling.

Mr. Greene's Results

The figures given for the ten silos show a range in weight of silage from 20.9 pounds per cubic foot to 43.8—over 100 per cent. The weights per cubic foot for the same silos as estimated from the tables show in one case 6.2 pounds less than that calculated from the actual weight and on the other extreme 20 pounds more, or actually double the weighed amount. These results do not give much encouragement to the use of tables for estimating silage. The writer would like to know just how these measurements were actually made—in relation to the time of filling, if the loose and more or less rotten layer on top was first removed, and if the inside diameter of the silo was actually measured. Some silos on the market fall short of the specifications regarding diameter.

It is interesting to note that in eight cases out of ten the table as used gave figures too high. We have also received statements from others that the figures underestimated rather than overestimated the amount of silage.

Some additional investigations might be of value as suggested by the editor, but if Mr. Greene's figures are accurate and some silage weighs more than twice as much per cubic foot as others, it would appear a hopeless job. It seems to the writer the important thing to do is for papers publishing the table to make clear the fact that the only reliable way to know how much silage is in a silo is to weigh it and that as stated by the authors in the original bulletin the tables are to be used primarily to estimate the capacity of silos when selecting one for use. In case silage is sold on the weight basis the only accurate way is to actually weigh it. If the tables are used to estimate the amount, it should be understood the parties concerned are willing to run the risk of considerable error.

Feeding Value of Silage Varies Less Than the Weight

After all, the errors made in estimating the weight of silage by the use of tables are not so serious as at first appears, for the reason that the feeding value depends upon the dry matter of the silage. The dry matter is subject to much less variation than is the total weight. The chart shows the relative amount of water and dry matter in the silage from each of the 25 silos used by the authors. Note the dry matter was almost constant. In silo 1 weighing 52.2 pounds per cubic foot there were 13.9 pounds dry matter per cubic foot, while silo 8 which averages 32.8 pounds per cubic foot of silage had 12.7 pounds dry matter per cubic foot. In other words, the feeding value of silage bears a much closer relation to volume than to weight. In fact, the chart suggests that no serious injustice would have resulted had the silage in all the 25 silos been considered of the same value per cubic foot regardless of weight.

Subscription Rates

Subscription in United States and Mexico three years for $1.00; single year, thirty-five cents. Canada, three years, $2.50; one year, $1.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $1.00 a year; not in Postal Union $1.50 a year. These rates include postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers who farm with businesslike methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received thirteen days previous to the date of publication. Advertising to be classified or changes in advertising must reach us three weeks previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

MILTON WHITNEY A. G. McCALL

Dr. A. G. McCall of the University of Maryland has been selected to head the Bureau of Soils in the U. S. Department of Agriculture, and takes the place of Professor Milton Whitney who has headed this work since its organization, but is now obliged, on account of ill health, to relinquish exacting administrative duties. Professor Whitney will devote himself to writing up results of important investigations on which he has been engaged for many years. Dr. McCall was a member of the U. S. Department of Agriculture from 1901 to 1904, then joined the staff of Ohio State University and served as head of the agronomy department until 1916 when he became head of the Department of Soils and Geology in the University of Maryland. Soil survey work in that state was started by Professor Whitney and completed under Dr. McCall.

Does It Pay to Feed, Weed, and Breed?

HOARD'S DAIRYMAN:—We think it does, and possibly the history of our herd may go to prove our ideas along that line to be substantially correct.

After over 40 years in business life, at over 60 years of age, the writer found himself out of business and with limited cash resources. Having always been prejudiced in favor of the farming game, he bought a hilly and sightly farm in the woods, at least three times as large as he would have bought in such a locality had he known what he was up against. The farm was minus buildings of any value and but little of it was under cultivation but it had some peat meadows yielding some fairly good slough hay. On sizing up the proposition he would have been glad to get out from under, but found it absolutely impossible to sell so decided to develop it and hired several acres cut off so as to have stump pasture. Then he took the winter short course at the state agricultural school and following that spent seven months on a cow testing job to get a line on dairying.

Realizing that he could not do the work necessary to develop such a proposition himself, he formed a fifty-fifty lease with tenants on the place who were used to woods farming and knew how to do the work necessary for development. The place now has about 50 acres under plow, 80 acres of stump pasture, 30 acres of peat meadow and pasture, and the balance woodland, a modern barn with steel stanchions, water cups, and a silo and usual outbuildings.

Five years ago last fall we bought 12 cows, 5 of the red variety already on the place and 7 grades of Holstein, Guernsey, and Jersey breeds. Later we bought at farmers' auctions. The first winter we had only the slough hay and some mill feed for them and insufficient summer pasture. We delivered about 1,200 lbs. of butterfat at the creamery during the first year, while last year with 18 cows we delivered around 4,700 lbs. We bought a young pure-bred Holstein bull when we bought our cows and now our cows are all Holstein grades but one. We joined a cow testing association three years ago and from our records have been able to weed and feed intelligently, using alfalfa and slough hay, corn silage, oats, barley, and linseed meal in moderate amounts. What our best cows would produce if pushed and pampered, we have no idea. Last year we had an average herd of 18.4 cows, six of them first calf heifers, one that milked only four months due to injury, one that did not breed and became a stripper, and one young heifer milked only eight months. In spite of handicaps named, which covered about half of the herd, the herd average per cow was as follows:

7,573 lbs. of milk
292 lbs. butterfat
$55.37 cost of feed
$142.79 value of product
$87.42 profit above feed cost
$2.58 return for $1.00 feed
19c feed cost per pound of butterfat
73c feed cost per 100 lbs. milk

Leaving out the six heifers and two cripples, eleven cows with second calves and over as to age averaged 323 lbs. fat and returned $103 above cost of feed.

This year we have 19 cows, of which number 13 were bred and raised on our farm. Seventeen freshened between October and April, and our March cream sales brought in over $300. We have only 3 of the original 12 in our present herd and 3 that we bought at auction in latter years of our partnership.

Our farming operations are of the cow, sow, and hen order. We feed the grain and roughage produced, except some gopher oats that are sold for seed. Our receipts last year for farm products were $3,216.25; operating expenses $784.95, $393 of which was for feed.

The proposition has furnished the writer five years of pleasant occupation even if not on the order of Wall Street profits.

Minnesota. O.

Good Dairy Butter

HOARD'S DAIRYMAN:—There is no question but that the best of butter can be made on the farm if proper methods of manufacture are employed. The dairyman has the distinct advantage of obtaining the milk in its best condition, and that is as it comes from the cow. The milk is practically sterile as it leaves the udder and if it is drawn in a clean manner into utensils that have been thoroughly washed and scalded after each usage, very little increase in numbers of bacteria will result. If the milk is then removed immediately from the stable before absorbing the barn odors and run through a separator that has been properly cleaned, the very best of cream will be obtained.

The practice of merely rinsing the separator at night and waiting u the morning's milking is separa before properly washing the mach should be condemned. The bacte increase rapidly in the milk and sli left in the bowl over night, and first cream that comes through in morning will be teeming with th organisms and thus the whole lot cream will be contaminated. If one has doubts about the poor qu ty of the cream that comes from unclean separator, let him take a w of the first cream as it comes f the spout and he will be convince

As soon as the milk is skimm the cream should be cooled to 50 grees F. or below, and not allo to rise above this temperature u ready to be used. Each new lot cream should be cooled before add it to the previous lots, so as not raise the temperature of the mixtu Cold water should be the cool agent, and not the cellar. Water cool milk or cream twenty-one ti as fast as air of the same tempe ture. In addition the cellar will quently impart objectionable od to the cream. It is not advisable hold the cream longer than th days before churning it, otherwise old cream flavor will develop.

The best method of ripening cream is by the use of a "start which is a pure culture of lactic bacteria. By its use the riper process can be controlled very re ly. However, for the small dair might not be practical to underta the making of a starter, in wh case the cream must be soured urally. Good results will be obtai in this way provided the cream i good quality and if it is held at proper ripening temperature of f 65 degrees to 75 degrees F. At temperature the lactic acid organi grow best and hold the undesir ones in check. The cream should held constantly at the ripening t perature until it is mildly sour, t cooled to the churning temperat and held at least for two hours be churning in order that the slo cooling fat globules will attain same temperature as the serum.

For hand churns the best churn temperature will be about 60 deg F. This may have to be varied so what, as it should be such that butter will come in 35 to 45 minu The butter will then be in a firm dition and it can readily be separa from the buttermilk. As much of buttermilk as possible should drained off and then the bu washed in two washings of wate remove all traces of buttermilk. butter is then removed from churn for salting and working. F one-half to three-fourths ounce salt per pound of butter is sufficie Too often dairy butter is critic for its high salt content, which not be the case if the above rat salting is followed. The worki should be sufficient to distribute salt and moisture evenly, so that butter will not be gritty or mott but will have a waxy body an bright appearance.

If these suggestions are follo the butter should be of high qu and score up with the best.

Vermont. J. A. NEWLANDE

Hay Standards

The U. S. Department of Agri ture has just issued a "Handboo Official Hay Standards," which tains a description of the fed standards for various kinds of and information as to how inspect and grading is done. A copy of handbook may be secured by writ the Hay, Feed, and Seed Divisi Bureau of Agricultural Econom U. S. Department of Agricultu Washington, D. C.

Washington Guernsey Field Day

HOARD'S DAIRYMAN:—This summer ie Snohomish County Guernsey lub acted as host to the Washington uernsey Cattle Club at the Valley em Farms, Washington. A com- ittee stopped each car as it arrived id tagged the occupants with a cket bearing the words, "Let's Get cquainted and Have a Bully Good me. I am ————. Who are u?" A picture of a "Bull Ram- nt" and with tail "Y'd" forming e "Bully." A checkup revealed 500 ests tagged, many coming from stant parts of the state, and in- ding one car from Montana and e from North Dakota.

The program started with a judg- demonstration by Professor E. V. lington of Washington State Col- ge. The second part of the pro- am was a demonstration of the lue of cow test association work County Agent Arnold Z. Smith. ree cows had been selected from Valley Gem herd, and guests were en a blank form and asked to ess their production. Their actual oduction was: No. 1, 390 lbs. fat; . 2, 620 lbs.; No. 3, 601 lbs. The sest guesser was Norman Lenfest o put their production at 430 lbs. lbs., and 520 lbs., his errors total- 151 lbs. fat. The second best sser was M. Stackland with an or total of 180 lbs. Prizes were 3-, and 1-year subscriptions to ard's Dairyman. The interest- thing about Hill's guess is that er he had estimated the produc- of the three cows he changed numbers on his score card to 3, and 1 without changing the ounts of fat. It all goes to show t even an expert cannot guess any- re near the probable production a cow. It requires the scales and Babcock test.

fter lunch twenty choice animals n the Valley Gem herd were tied a rack in full view of the crowd from there were led one at a into the "sale ring" where Geo. Gue, the veteran auctioneer, auc- ed them off in a mock sale to the est bidders. The sale was con- ed in regular "national" style. h bidder had been provided with dder's card on which he was re- ed to put down his final bid (or ation) on each animal brought Later these bids were compared the appraised value of each ani- —the appraisal having been made iously by a group of experienced ders and stockmen. There were who tied for first place as hav- made the least error from the aised valuations.

ne object of the mock auction was to educate breeders in the true value of good Guernsey cattle. It is true that many people bid wildly, since no money was involved, yet many others showed a keen knowledge of Guernseys and a real ability to buy right.

Washington. J. E. WRAGE.

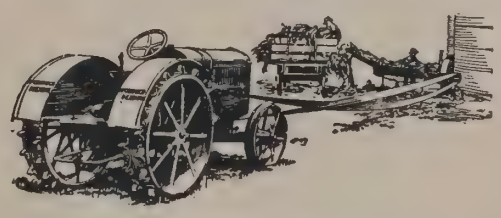
BREEDING UP

Four generations at Valley Gem Farms where the Washington Guernsey Field Day as held. The great grandam at left has 496 lbs. fat in Class A, grandam with 412 lbs. t in Class CC, dam with over 500 lbs. fat in Class CCC, and the young daughter.

Great Servants of Agriculture

These 4-Cylinder Tractors

McCormick-Deering 15-30 10-20 Farmall



McCormick-Deering 15-30. *Three-plow power and capacity. Showing also the McCormick-Deering Corn Picker which goes into the standing corn and does the work of six hand huskers*

THE years of experience of the Harvester Company in the building of power farming equipment has produced the finely developed McCormick-Deering Tractors shown in these three views. One is a 3-plow tractor *with power to spare.* The others are 2-plow tractors, *also with a liberal surplus of power.*

Where any member of this trio of tractors is on the job, power farming is at its best, easiest and most profitable level. So popular have the 15-30 and 10-20 been for several years that you can now find them plugging away any day in any farming community in the land. The FARMALL is younger, but already old in service on thousands of corn and cotton farms. It meets the demand for a *true general-purpose tractor* that will replace animal power *for plowing, disking, planting, cultivating, mowing, raking, and all other farm power work.*

Put a 15-30, a 10-20 or a *Farmall* at work—or use the special features of the new *Farmall* in combination with the 15-30 or 10-20 tractor—and settle your farm power problem for years to come. Hundreds of farms are being handled much more efficiently by the use of *two* tractors. Write for a catalog, and see the tractors themselves at the McCormick-Deering dealer's.

Above: **McCormick-Deering 10-20.** *Liberal Power for Belt, Drawbar and Power Take-Off*

At right: **McCormick-Deering Farmall** *It plows, plants, cultivates, mows and rakes—it "does it all."*

INTERNATIONAL HARVESTER COMPANY OF AMERICA (*Incorporated*)

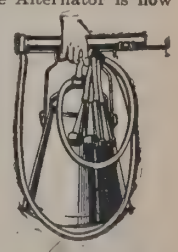
Plan to Stop Butter Thieves

HOARD'S DAIRYMAN:—Your article on the editorial page in regard to the butter thieves stealing butter from our creamery was very good. You were right when you stated that through organization and burglar alarms it can be minimized.

Wish to state that at the annual meeting of the Wisconsin Creameries' Association held at Chippewa Falls I brought up this matter of organization against butter thieves. The plan I had in mind was to get the association to put into action a state organization, getting as many creameries and cheese factories to join that they could charge a fee of about $10. Then have bulletins printed showing the members and the reward offered for each man arrested and convicted of stealing butter or cheese; the bulletin to be posted at the factory and bulletins sent to detective agencies.



Much time is spent in planning how more money may be obtained for their product, but not much time is spent guarding what they already have. R. W. HEDEMAN, Sec.-Treas.

Proved, now IMPROVED!

With the new Drive, the Standard Hinman Milker is now *better than ever!*

Every advantage of the proved Hinman Method of milking becomes all the more desirable. One small, compact drive, which we call the Alternator, now makes installation Simpicity itself—in any barn, and for any size herd.

Tried, tested, proved, like everything that bears the Hinman name, the Alternator is now at work, pleasing both new and old Hinman Owners.

Write for descriptive folder. Get the latest information on the "Milker most dairymen use." Ask for catalog, too. Get *all* the facts about the Hinman. Address

HINMAN MILKING MACHINE CO.

Cream Thief Caught

HOARD'S DAIRYMAN:—There are more faulty separators than is often supposed. As tester for the Chippewa Association of Michigan I have found a number of separators losing heavily.

One member stopped a loss of $96 per year by replacing an old separator with a new one; another saved $59 per year by replacing old separator. Another member spent 15c for repairs and stopped a loss of $60 per year. Another member repaired his old separator and saved an annual loss of $116.50.

The four separators had an average loss of $82.88, and it would take the profit from a cow producing about 350 lbs. fat to replace this loss. Why not stop this loss and keep one cow less? ROLLIN C. LONEGROVE, Tester.

Unique Hay Wagon

HOARD'S DAIRYMAN:—Where only a boy or girl for driving team and a man for loading hay from a hay loader are available, the following may be of interest:

A farmer at Poynette, Wisconsin, has devised on a regular flat hay rack another one only half the length. This has four small wheels underneath which run on a track of strap iron on the full length of the main rack. The bottom of the movable rack is only about 8 inches above the main one.

To load hay the loader is attached to wagon and this movable rack with a front ladder attached just like the main one is run to the back end of the rack or wagon, this end or half of the wagon is loaded first as high as possible, one man being on it to do this. He does not have to drag the hay from one end of the wagon to the other, and it is the walking up and down on a load of hay that is harder than the building.

When this back end is loaded it is a simple matter to pull it to the front end of wagon. For this purpose a ratchet wheel and shaft with cable was taken off of an old manure spreader that had to be wound back after every unloading, and was attached on front of the main fra rack. The handle for winding is right hand side for general conve ence. When hauled ahead, the ba end is again ready for loading and lot of energy is saved. The load c be unloaded in the regular way.

This is a good plan in this secti where farmers are prejudiced agai slings, for the regular harpoon sho work well on this kind of a load.

W. ERIC CONSTABLE, Tester

Making Comparisons

HOARD'S DAIRYMAN:—There at least two outstanding points wh are going to help make my new y more interesting and it can and v help many others.

The first item is to list the cows each herd in the Herd Book in or of merit according to the best of owner's judgment. This turns very disastrous to him sometir when he discovers number one ou to be down the row several notch and again it makes him feel g when he guessed right and apparen hit the nail square on the head.

The second item of importance i comparison of monthly records of year previous. This tells many ta One herd in the Leelanau Associat of Michigan that averaged 402 pou of fat for the year, started last y with an average of 36 pounds for first month. For the correspond month of this year it averaged pounds, or an increase of 4 pour Maybe your member doesn't notice Call his attention to the fact for s an item cannot help but create in est. Every association has such amples and nine out of ten (if more) are left up to the tester to f Let's do it.

W. G. KIRKPATRICK, Teste

Better Profits

HOARD'S DAIRYMAN:—What be accomplished through testing revealed in comparisons of the ords of the Lancaster—Seward A cation of Nebraska in 1925 and 1 These figures are based on practic the same herds both years. In 1 milk was worth an average of $2.(cwt. on the farm and $2.07 in 1 Feed prices averaged 1% highe 1926.

In 1925 there were 411 cows had an average feed cost of $83, a return of $76 over cost of feed. 1926 there were 426 cows that hac average feed cost of $75, and a ret of $96 over cost of feed. The pr was $20 greater per cow due t lowered feed cost of $7 and to lar production. For the entire asso tion this was an increased profit over eight thousand dollars.

Herd No. 1 in 1925 had an aver

IOWA TESTERS MEET

Iowa cow testers met in group conferences during the month of April. Conferences were held at Algona, Mason City, Waterloo, West Union, Cedar Rapids, Elkader, and Des Moines. The conferences opened at 1:00 p. m. and closed at 11:00 a. m. the following day.

Methods of giving greater service to members, publicity, a pure-bred sire project, the planning of cow testing association picnics, tours, meetings, and other topics were discussed by the testers.

This is the third series of conferences held for testers in Iowa. Two series of conferences are planned for each year, one series to be held in the spring, and one series to be held in the fall.—EARL N. SHULTZ.

roduction of 338 pounds fat, with a rofit over feed of $92. In 1926 this erd had an average production of 451 ounds fat and, although the feed ost increased $14, the profit over eed was $133. For the herd of 25 ows this meant an increased profit of ver one thousand dollars.

Herd No. 2 had an average production of 249 pounds fat in 1925, with profit over feed of $79. In 1926 this erd had an average of 311 pounds t and a profit over feed of $109, spite an increase of $24 in cost of ed. For the entire herd of 20 this eant an increased profit of over 00. GEORGE PFEIFFER, Tester.

ummer Trouble in Testing

The Wisconsin Monthly Cow Testg News Letter offers the following ggestions concerning summer testg:

1. Be certain to have the acid and lk at 60 to 65° before mixing.
2. Hard water causes foam on the per meniscus of the fat column.
3. A dark-colored fat column conning dark particles near the lower niscus may be caused by one or re of the following:

A. The acid was too strong.
B. Too much acid was used.
C. The acid was too warm when ied to the milk.
D. The milk was too warm when acid was added.
E. The acid was dropped directly o the milk.
F. The mixing was interrupted be- e the solution was complete.
G. The acid and the milk stood too g before being mixed.
L. A light colored fat column conning white curdy material or sedint near the lower meniscus may be sed by one or more of the follow-:

1. The acid was too weak.
3. Too little acid was used.
5. The acid was too cold when add- to the milk.
6. The milk was too cold when the l was added.
7. The mixing was not continued g enough to dissolve all the serum ds.

. How to dilute strong acid: Go loors with about ¼ (one-fourth of cold water and add to this ugh cold acid to fill the cup. Do the night before using, and add cup of diluted acid to the gallon of acid. Be sure the acid is cold re using.

Increases Average Production

he Cedarburg—Grafton Associa- of Wisconsin increased its aver- production in four years from 290 38 pounds fat per cow. This in- se in production is ascribed by tester, Gust Wild, to better feed- weeding, and breeding. There a total of 148 cows sold as un- table, or 11 per cent of those in association. There were 103 -bred bulls and 82 cows sold, 20 bulls and 31 cows purchased nembers. Fourteen members are g bulls sired by Sir Bess, a son of five of these being out of cows C. T. A. records of over 500 ds fat.

rom observations taken from time to time on my rounds," says Mr. Wild, "I am personally satisfied that there is not a herd in the association that will not produce an average of over 300 lbs. of butterfat if properly taken care of. There is no herd in the association that does not produce good in the winter months. The trouble comes in the summer when the pasture is short and the heat and flies come. Under these conditions the cows go down in milk production. In fact, I have seen herds drop over 4000 lbs. in milk in one month, which could have been largely avoided with a little extra feed. We know that this is the busy time of the farmers, yet it will pay them for the extra work and feed necessary to feed the herd to prevent most of this slump in milk production in the summer."

Monthly State Summary Table

Saves Sixty Dollars

One separator left 1.1 per cent fat in the skimmilk last month and this member had a Jersey herd with over 11,000 lbs. milk for the month. This loss of 121 lbs. of butterfat at 50c per pound is worth $60.50. This man came into the association last month just to fill out the association and I think that we saved him enough in one month to join the association for almost two years. I have never seen a separator like this before.—W. C. HENDERSON, Tester, Menomonie C. T. A., Wisconsin.

NASH

Leads the World in Motor Car Value

3 New Series · New Lower Prices

21 Models—All Sizes

$865 f. o. b. factory upwards

Come drive

the smoothest, quietest cars you ever rode in --

An even more sensational 7-Bearing motor

The Nash Motors Company extends to everybody interested in unusual motor car performance a special invitation to *DRIVE* one of the New Nash models.

You will get a thrill out of the *SPEED* and *POWER* and *SMOOTHNESS* of this newly refined Nash 7-bearing motor that cannot be imagined but must be experienced.

In every phase of performance it is a sensational motor.

The clutch, flywheel and crankshaft are balanced as a single unit to banish vibration.

You could pay the highest price asked for any car and not get a motor with the perfection of smoothness and quietness in combination with such rare roadability as Nash now offers you in every new Nash model at new *LOWER* prices.

And all 21 of the new Nash models are now cradled on new springs built of a secret new steel alloy.

This new material gives Nash springs a smoothness and ease of action found in no other car, *regardless of price.*

These new Nash springs are individually designed and balanced scientifically to the weight and size of each Nash model—*actually* 9 *different rear spring types in all.*

You simply must see them—and *DRIVE* one—to realize the extraordinary performance, beauty, quality and value that Nash is giving you at these new *LOWER* prices.

10 Day Test

More MONEY for YOUR MILK

Write today for descriptive literature and particulars of how Dr. Clark's PURITY Milk Strainers help you get Grade "A" test and more money for your milk.

It is the only Strainer made that's guaranteed to strain 100% clean. Our 10 Day Trial Test enables you to prove it at our risk—your money back if it fails to remove ALL the dirt. Thousands in use — two sizes 10 qt. and 18 qt. Sold by dealers everywhere. (6)

PURITY STAMPING COMPANY
Dept. Q5 Battle Creek, Michigan

DR. CLARK'S Purity MILK STRAINER

When buying mention Hoard's Dairyman to your merchant or dealer—it helps us!

There's no economy in "cheap" tires

FIGURE it for yourself—in a tire that costs $13.95 you get a good deal more for your money than you do when you buy one that costs $8.95 and gives only half as much mileage.

As for expecting to get the same mileage from the $8.95 tire that you would from the better one, it is the sad experience of most of us that in this world you seldom get any more than you pay for.

Whether you buy Kelly-Springfield tires or not, buy *good* tires—it pays. And if you want to be *sure* of getting good tires, buy Kellys.

They don't cost any more than a lot of other tires.

"Kelly dealers everywhere—
there must be one in your town"

New U. S. Champion Cow

DAISY AAGGIE ORMSBY 3D

THE largest butterfat record ever made in one year by a cow in this country has just been completed by Daisy Aaggie Ormsby 3d, a 7-year-old Holstein owned by Lakefield Farms of Michigan. In 365 days she produced 33,140 lbs. milk containing 1,286.23 lbs. butterfat (1,607.78 lbs. butter), 68 lbs. more fat than was produced by May Walker Ollie Homestead and 63.08 lbs. less than was produced by the Canadian cow, De Kol Plus Segis Dixie.

This one record is not the only good one made by the new champion daughter of S. P. O. M. 37th bred by John Erickson. As a 2-year-old she produced 870 lbs. fat in a year; she had 996.11 lbs. fat as a 3-year-old and 1,038.08 lbs. fat at 6 years.

Pasture Problems are Important

HOARD'S DAIRYMAN:—As one rides over the corn belt, with high-priced farm land on each side of the road, it is apparent that there is one problem which needs a good deal of attention, that being the pasture problem. There seems to be a general idea on the part of many farmers that although good care must be taken of the cultivated land, cropping systems carried out which will keep up the fertility, and fertilizers must sometimes be applied, yet the pastures can take care of themselves.

In a ride of about 150 miles across a portion of Iowa one fall, the writer made a survey of the pastures as seen from the highway. In practically every instance it was apparent that these pastures had been left to shift for themselves. They were very weedy. Little effort had been made to make use of such a pasture crop as sweet clover, and in general the pasture conditions were not in keeping with the high price of the land. Along in the late summer, most of these pastures in the average season would have been worthless from a feed standpoint. It is small wonder that the milk flow of the dairy herd drops or that a beef cattle herd fails to do very well when compelled to make use of such pastures.

Up-to-date farmers in many sections are gradually taking more interest in pastures. The use of barnyard manure for top-dressing is becoming more frequent. The breaking up of the old pastures and substitution of sudan grass and sweet clover, or both, for the native grasses is being carried out by others. Disking of pastures and reseeding is practiced to some extent. The principle of rotation of the pasture land is becoming better understood. Some farmers divide their pasture land into two or three areas, grazing on these various areas in turn. This gives a chance for one pasture to recuperate while the other is being grazed.

We are becoming very efficient in the use of cultivated land. There increasing evidence that we will m and more consider the pasture pr lem.

Nebraska. H. H. BIGGA

Origin of Animal Husband

"When the Lord created the u verse He made cattle before made man," says Sam H. Gree secretary of California Dairy Co cil, and refers to the Bible for authority.

"The first chapter of Genesis tests the fact that the cow grazed the Garden of Eden and rumina under the apple tree," contire Greene. "It was in the Garden Eden that there was established inter-dependence between man cattle that has increased through ages.

"When Adam and Eve were dri out of Paradise, the cow also barred from the garden and soon came a wild creature roaming alo in search of pasture. Six generat later Jabal, a descendant of C captured a few of these Nomadic tle and animal husbandry had its ginning so far as Bible history g Noah took cattle into the ark th him and, following the flood, ani keeping made great strides. Ala ham owned vast herds and the ar buttermaking dates back to his or beyond.

"The Bible tells us that Abra gave butter to his angel visitors, that milk and butter were the dinary foods of infants during cient times as they are today. Pr tive methods of churning were use Biblical times; the milk was tied in a goatskin bag, suspended f three poles driven into the grou and swung to and fro until the and butterfat separated. Ano early method was to pour the into earthen vessels and beat it th the hands, and later a wooden sc was used to stir the liquid.

"The people of India especially erated the cow and her product, paid her high tribute in their sa

writings. Butter was used as a sacrifice upon the fire altar, in addition to being eaten as a food. Buddha in describing the customs of an ancient Hindu race said: 'They do not kill cows; like unto a mother, a father, a brother, and other relatives the cows are our best friends, in which medicine is produced. They give food, they give strength, they likewise give happiness.'"

Morrison Leaves Wisconsin

F. B. Morrison, co-author of Henry and Morrison's "Feeds and Feeding," and assistant director of the Wisconsin Experiment Station, has been appointed director of the New York Experiment Stations with headquarters at Geneva. Professor Morrison takes his new post October first.

Born and reared on a Wisconsin farm, graduated from the University

F. B. MORRISON

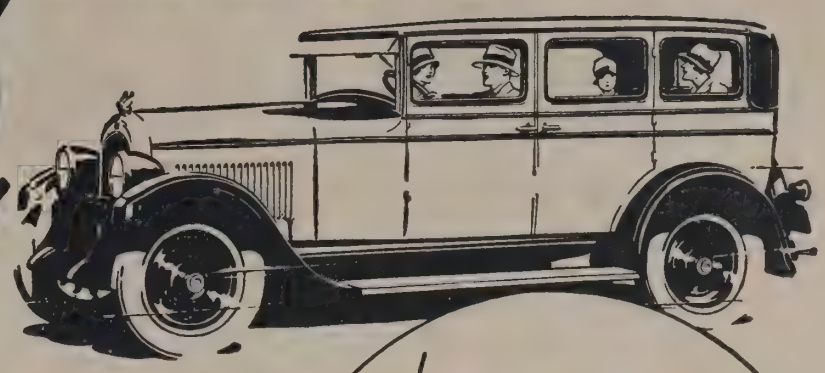
Wisconsin with high scholastic honors in 1911, Frank Barron Morrison has been a member of the agricultural college staff at Madison for sixteen years. In 1915 he became assistant director of the Experiment Station, and during the absence of Dean L. L. Russell has twice served as the acting dean of the College of Agriculture and director of the Experiment Station.

Short Course in Cow Testing

The Wisconsin College of Agriculture will offer a five weeks' course in preparation for cow testing beginning November 14 and ending December 18. The demand for men for cow testing associations is greater than the supply, and this course is given to meet the emergency. All high school graduates are eligible, and others with equivalent training or exceptional dairy experience may take the course. Others are urged to take the work given in the Short Course covering a period of longer preparation for this important work.

Classes will be held from 8:00 to 4:30 each day and will consist of feeding and management of dairy cattle, milk testing, dairy feeds and feeding, animal diseases, dairy records, and physical education. The cost will be $9.34 for the five weeks' term.

The course requires a man who is good at writing and in arithmetic and to better his dairy experience the more profitable cow tester he may become. Cow testing offers a splendid opportunity for service to a community and gives the tester many opportunities for studying the farming method of persons in the cow testing associations. Young men may well consider this position as it pays a good salary for properly trained men.



Persons planning to enter the course should write J. A. James, Assistant Dean of the College of Agriculture at Madison, Wisconsin.

Many States Enter

Entries in the dairy cattle judging contest and demonstration teams contest for 4-H Club members at the National Dairy Exposition closed August 1st, with a larger number of states represented than ever before. The following 25 states have entered teams in the cattle club judging contest: Arkansas, Florida, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Nebraska, New York, Ohio, Oklahoma, Pennsylvania, South Dakota, Tennessee, Vermont, Wisconsin, and West Virginia.

The cattle club judging contest will be held on Monday, October 17. The demonstration teams will be on the program daily, from October 17 to 19 inclusive.

NEW CHRYSLER "52"

Still Higher Quality— Yet Lower Prices

You need only to glance at Chrysler's latest product—the new "52"—*and at its astonishingly low prices*—to realize that again Chrysler Standardized Quality has yielded more to the buyer than money has ever been able to buy before.

Examine and note the full size and roominess of its staunch, handsome body of wood and steel. Enjoy its ample seating capacity for adult passengers. Delight your eye with its grace and trimness of appearance, its luxury of appointment.

Here are flowing lines, beautiful hardware, luxurious mohair upholstery and every refinement of detail—combined in a car you will be proud to own.

We are eager that you ride in it. We want you to see how easily and smoothly it gives you 52 unvarying miles and more per hour. Enjoy the snap of its pick-up, 5 to 25 miles per hour in 8 seconds. See how smoothly it out-performs all others with which you may contrast it.

After such a thorough test we are sure you will agree that, at such low prices, these Chrysler "52" advantages are obviously outstanding over all competition.

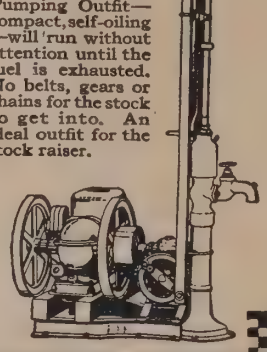
The Enclosed Engine that Oils Itself

Insurance that Protects Your Engine Investment

The insurance that goes with the John Deere Engine is built into it—no written policy could offer more complete protection.

The working parts are all enclosed in a dust-proof case and operate in a bath of oil—real protection against wear, loss of power and high upkeep costs.



There are no sight-feed oilers or grease cups on it—runs without one minute's attention from the time you start it until the fuel is exhausted—protection against carelessness and loss of time.

There are no gears exposed or shafts extended on which clothing might catch—protection against accidents.

Don't forget, John Deere quality construction—the use of good material by good workmen results in years of satisfactory and profitable service.

You can get John Deere Type E Engines in 1-1/2-, 3- and 6-H. P. sizes, either mounted on skids or wheels.

Give your John Deere dealer the opportunity to demonstrate this easy-starting, smooth-running farm engine. You will find it a real labor saver and money maker on your farm.

This is the John Deere Direct Drive Pumping Outfit—compact, self-oiling—will run without attention until the fuel is exhausted. No belts, gears or chains for the stock to get into. An ideal outfit for the stock raiser.

FREE ENGINE BOOKLET FOR THE ASKING

This booklet illustrates and describes both the John Deere Engine and the John Deere Pumping Outfit. Write to John Deere, Moline, Illinois, and ask for Booklet WT-714.

Seasonable Live Stock Notes

SEPTEMBER spells silo filling on thousands of dairy farms. Wheat, oats, and barley are in the bin; new straw is ready for bedding. Manure is being hauled to the stubble field or meadow where it will be turned down and later contribute to the making of a new crop. Fall litters of pigs are already at their breakfast table. Early arrivals in the calf pen are trying to find something to suck in the milk feeding bucket. The early hatched pullet is speculating on how and where to lay an egg.

It Takes Skill to Feed Calves

Nothing in the husbandry of dairy cattle requires more skill, if successful, than the first month's feeding of dairy calves. A successful Indiana Jersey breeder uses the following method: Clean quarters are given each cow at calving time. The newborn calf is allowed to suck its dam for 4½ days, after which it is fed whole milk for three weeks. At this time skimmilk is gradually substituted for whole milk and is continued until the calf is six months old. When calves are a month old, shelled corn and oats and mixed or clover hay are placed before them. Feeding buckets are scalded once each day.

Fall Pigs are Here

If we were to name the time when feeding the brood sow is of greatest importance, we would say the first two weeks after farrowing. It is so easy then to upset good prospects by doing the wrong thing. Of course, fall pigs should be born in clean places just the same as is required for spring pigs. The first day after farrowing give the sow plenty of water—nothing more. The second day give her a double handful of meal to a feed and feed it as a slop. The third day give two double handfuls to the feed; the fourth day three double handfuls; and each of the three succeeding days give her four double handfuls of meal to a feed. A good meal mixture may be made of equal parts by weight of bran, shorts, and ground oats. After the first week the sow may be brought up to full feed gradually and corn may be added to the ration.

Looking Forward to Winter Eggs

Most folks, no doubt, would like to receive the higher prices paid for eggs during November and December, but frequently they have few eggs to sell at that time. Early winter eggs mean planning ahead and having things right and ready at the right time. Of course, early hatched and well grown pullets are essential. Those who have planned this w ahead will now want to look ov their housing and feeding equipme Those who have winter eggs to sell high prices house their flocks ea and get them accustomed to their l ing quarters. One cannot house t flock early unless the house and fe ing equipment are ready. The b features of last season's housing, any, should be remedied now.

Milk Fever

A lot of calves coming in the fall the year bring with them the pos bility of milk fever, particula among the well fed, heavy produce of mature age. While it is essent to have cows in good condition time of freshening, it is equally e sential to be ready to handle a ca of milk fever. Prevention is s er than cure. As a part of preventi we mention light feeding for the fi week or two after calving. Let t cow take a little meat off her back. won't hurt her any. Come up on t feed later after she has her milk ma ing organs adjusted. Every dai man who has high producing co should have an air treatment out and know how to use it or else should know that he can always g a good veterinarian within an hour so after he knows something is wro

Less Harm in Empty Stall Than Boarder Cow

It has been a fairly tough season many places to get crops through harvest and ready for winter feedi Now that the harvest is nearing co pletion, is there anything wrong wi looking over the herd to find c whether some cows ought to be tired? It is bad enough to have fight unfavorable weather conditio in the growing of feed, but why fe any of this feed to scrub cows? every herd are to be found co whose production is not enough to e title them a place at the manger. empty stall may make more mon than some cows in your herd w make if kept through the winter. A time is a good time to retire a boar cow but 'tis better to give them t gate in September than feed them winter.

Public sentiment is everythin with public sentiment nothing c fail, without it nothing can succe Consequently he who molds pub sentiment goes deeper than he w enacts statutes or pronounces de sions. He makes statutes and de sions possible or impossible to be e ecuted.—LINCOLN.

RED LADY

This pure-bred Jersey has just completed a R. M. record of 19,608 lbs. milk, 1,028.51 lbs. butterfat in 365 days, the highest record made in the southern states. On a previous test she produced 17,195 lbs. milk, 860.24 lbs. fat. Red Lady was bred and is owned by R. L. Shuford of North Carolina.—The American Jersey Cattle Club.

Genuine Cork Linoleum Rugs in NEW–DIFFERENT–PRETTIER *Patterns*

Now you may have a smooth-surface rug with a lovely wax finish!

HOW often have you wished for a rug like this: pretty enough for the most tastefully furnished room, yet inexpensive . . . easy to keep clean, yet without that "hardness" sometimes associated with smooth-surface rugs.

Now you may have just such a rug. The new Armstrong's Jaspé Rugs are made of the same genuine linoleum with the lustrous wax finish that has made Armstrong's Jaspé Linoleum Floors so popular. They have the same wonderful wearing qualities, too, for the beautiful Jaspé graining runs right through to the burlap back—it can't "wear off." A light damp-mopping cleans the surface, an occasional waxing or polishing with a soft cloth or pad restores its wonderful lustre.

In rich blues, greens, grays, rose, tan, and taupe, with handsomely decorated borders, these new Armstrong Rugs offer unusual opportunities for home beautifying at little cost. Place one of them in any room in the house, and you have the beginning of a charming color scheme. For bedrooms, dining-room, living-room, playroom or sewing room, there is nothing more suitable or practicable as a floor covering.

Properly waxed and cared for, Armstrong's Jaspé Rugs always look fresh and inviting. Because they are made of genuine cork linoleum, they are sturdy, yet soft and pliable and quiet to the tread. You may roll them and move them from room to room as often as you please . . . yet these rugs do lie flat on the floor.

In the large illustration:
Jaspé Pattern No. 716
Above: *Linoleum Rug No. 907*
At the Right: *Inlaid Rug No. 1040*

When you buy a smooth-surface rug, bear in mind that these new Jaspé rugs are made only in genuine Armstrong's Linoleum, identified by the Circle A trade-mark stamped on the burlap back. Ask the salesman in the local store to show you the new Armstrong Rugs of Jaspé linoleum. If he hasn't the new patterns in stock he can get them for you.

"Rugs of Practical Beauty"

This handsome booklet illustrates the new patterns beautifully in color. It will be sent to you free if you address your request to Armstrong Cork Company, Linoleum Division, 1019 Jackson Street, Lancaster, Pennsylvania.

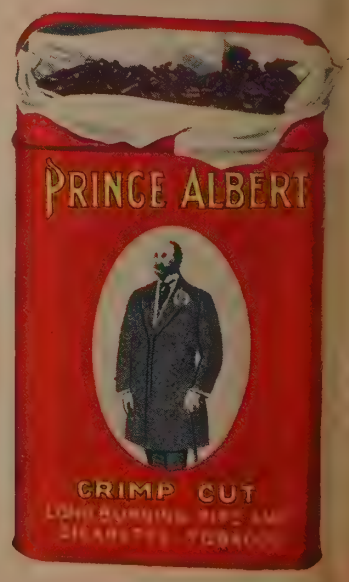
My crowd all smoke P. A.



THAT doesn't mean I smoke it because the rest of the fellows do. I've got ideas of my own. If you pinned me down to reasons, I'd say I smoke Prince Albert *because I like it!* That's reason enough for me. But if you want details, I'll give them to you.

First of all, P. A. is delightfully fragrant. When you open the tidy red tin and that aroma bursts upon the air, you can hardly wait to taste such tobacco in your pipe. The smoke itself makes good on the advance notices broadcast by the fragrance.

Cool as an alarm-clock doing its stuff. Sweet as the recollection that you have the day off. Mild as the congratulations of the defeated candidate. So mild, in fact, that it never bites the tongue or parches the throat. Yet with plenty of rich, satisfying tobacco-body.

I don't know what brand you're smoking now, but I *do* know what you'll be smoking "from now on" when you try this cool, long-burning tobacco I've been telling you about. If you want to get the most out of your pipe, pack it with P. A. That's *my* advice.

P. A. is sold everywhere in tidy red tins, pound and half-pound tin humidors, and pound crystal-glass humidors with sponge-moistener top. And always with every bit of bite and parch removed by the Prince Albert process.

PRINCE ALBERT

—no other tobacco is like it!

Harvesting Corn for Cow Feed

ARLY frosts and immature corn are anticipated. We cannot control killing frosts nor speed up maturity of corn but we are itly interested in quality and ntity of cow feed. Since corn, as n and roughage, constitutes so h of the rations of farm animals important that we consider the ways of handling the crop so its greatest usefulness may be for feeding live stock.

is helpful, perhaps, to review some of the behavior of the corn t during the later part of its vth in order to understand when arvest the crop and what kind of we will have should frosts come arly.

enry & Morrison report some obations made by Ladd of the New Station and Jones of the Indi- Station as to the composition of corn plant through its various es toward maturity. Calculations made on the acre basis of corn ng 10,000 stalks per acre. There 3,556 hills of corn in an acre checked in rows 42 inches apart. corn, therefore, averaged not three stalks per hill.

ie first observation was made on 24th when the corn was about feet high and before any tassels appeared. At this stage there 5,138 lbs. of green corn per acre h contained 731 lbs. of dry mat- On a percentage basis the corn 86 per cent water at this stage rowth.

September 10 when the ears in the milk stage the total green ht was 26,710 lbs. containing lbs. of dry matter. Thus from 24 to September 10, a period of ays, the green weight was five greater and the dry matter at more than eight times greater on July 24.

October 1 when the corn was dered to be right for silage, the weight was 25,275 lbs. and this ined 8,929 lbs. of dry matter. this we learn that the green it has gone down and the dry r weight up as compared to the vations made when the ears in the milk stage. It is impor- to note that the dry matter in- ed 2,755 lbs. from September 10 tober 1, a period of 21 days.

October 8 the green weight had down to 22,253 lbs. but the dry r had further increased to 9,412 At this stage 42 per cent of the plant was dry matter.

e data given show further that was a gradual increase in nus up to October 8 when the corn considered to be beyond damage ost.

the silage stage, October 1, of otal dry matter in the one-acre 4,625 lbs. were found in the ears ,304 lbs. in the stalk or stover. ek later 55 per cent of the total natter was in the ears.

summarize on the dry matter we might say that when corn is bout four feet high without tas- t contains only about eight per as much dry matter as when it fectly matured. When the first s appear the crop contains about r cent, when the silks are dry- bout 48 per cent, when in the stage about 65 per cent, when irs are well glazed about 86 per nd when the corn is fully ready lage about 94 per cent as much natter as when matured.

hould be kept in mind that these s are based on what might be ered a normal stand of corn. A r stand, while it might yield as dry matter, would likely have a r proportion of it in the stalks ver.

Armsby of the Pennsylvania Station summarized some work at four northern stations from which it was found that corn yielding 4,415 lbs. of ears per acre (63 bushels) also yielded 3,838 lbs. of stover. It was found that the stover contained 37 per cent of the total digestible nutrients.

There are unavoidable losses in the corn crop whether put in the silo or shocked as fodder. Experimental trials indicate that where corn is put in well-made shocks and left for a few months, the loss of dry matter will be about 20 per cent. The loss of dry matter when corn is put in the silo is estimated to be about 15 per cent though there may be considerable variation due to stage of maturity and to conditions of the silo itself which may influence the keeping of silage.

An acre of corn fed as silage has a higher feeding value than a similar acre harvested and fed as fodder when no effort is made to convert the fodder into a more palatable form by cutting or grinding. The difference comes mainly because more of the crop is eaten when fed as silage and there is less loss in dry matter because there is no weathering. If we compare silage with fodder on the dry matter basis and consider only what is consumed they are of nearly equal feeding value.

Let us now consider ways of getting the most feed per acre from whatever kind of crop seasonal and soil conditions give us.

The silo comes first as a preserver of the corn crop. More of the crop is saved from the field and less is wasted in feeding than in any other practical method known.

Next to this we would put well shocked fodder corn which, when cut or ground by a modern roughage grinder, makes a very satisfactory feed and there is little of it wasted. Poorly shocked corn left in the field several months will, of course, lose considerable of its value.

Feeding corn fodder in the rough is a wasteful method of trying to get a lot of feed value from an acre of corn. So much of it is refused by cows whose rations ought to be made palatable.

Shredded corn stover is a poor roughage for dairy cows in milk. It is unpalatable and comparatively low in nutrients; it requires legume hay and considerable of the higher priced protein supplements to balance the ration. A limited amount of shredded corn stover could be used if properly supplemented. It would be much better to cut finely or grind the fodder (ears and stalks) than to shred the crop.

The present stage of maturity of corn on many farms indicates the yield of dry matter will be below normal. This is not so much to lament if one has plenty of legume hay. The judicious combining of legume hay and other roughage, principally corn this winter, is one way of getting through the winter on a short corn crop of inferior quality.

Argentine Dairy Industry

During 1926 Argentine produced 76,000,000 lbs. of creamery butter, an increase of 3,000,000 lbs. over the previous year. Of this production, 64,000,000 pounds were exported, or better than 80 per cent. Factory cheese production in 1926 amounted to 33,000,000 pounds, a decrease of nearly a million pounds from the previous year. Less than a million pounds of this was exported.

The girls nowadays may catch the boys with face powder but it takes baking powder to hold them.

Fall is the best time to repair old fences -and build new ones

THE only reason that you have figured to do all your fence work in the Spring is because, in the old wood post days, it was easier then to dig post holes. But with the RED TOP Steel Fence Post any time at any season of the year is fence-building time. Now you can do your fence work in the Fall and take this job out of your busy Spring season. Regardless of the hardness of the soil, one man with a RED TOP One-Man-Driver can easily drive 200 to 300 posts a day—and align them perfectly.

Drive in a RED TOP Post alongside each broken or rotten wood post, attach the same fencing to it with the RED TOP handy fastener. The work is done quickly, the useful life of the fence is lengthened and in a few years you will have entirely rebuilt your fence line with no more annual work to do on that fence.

Red Top GUARANTEED **Steel Fence Posts**

And your fences will pay for themselves. Any 40 acres that isn't fenced hog tight, can be fenced hog tight and the grain the harvesters overlooked the hogs will salvage. That will pay for the fence in two years. And every year thereafter this same 40 acres will bring in an extra $80.00 or more.

If you do it now you make this saving this year. If you wait until Spring you lose the saving until next Fall.

Take this idea to your* RED TOP *dealer

RED TOP Steel Fence Posts Are Guaranteed

He will give you more detailed information. The fact that he handles RED TOP Steel Fence Posts indicates that he is not only an authority on fencing materials but also on how the proper and timely use of fencing will help you turn waste into profits.

Two Types: Double and Single Units

$4500 Extra PROFIT!

IN November, 1925, a certified dairy in Wisconsin installed 6 double-unit Universal Milkers. The equipment eliminated three men from the payroll who, with board, were costing $90.00 a month, representing a total saving of $3,240 per year! Over a period of two years the equipment will have paid for itself and netted the dairyman an extra profit of $4,500.

Write for free catalog which tells all about this profit-making equipment.

The Radio in the Country Home

ETHEL MORRISON—MARSDEN, WISCONSIN

THE radio has crept into the heart of the country home and once there it has established itself so very securely that unquestionably it is there to stay. The radio has brought much with it; it not only provides music and entertainment for the farmer and his wife but it supplies a vast amount of very useful information as well. It is like a magic book, each page of which brings forth some new, delightful surprise. The radio ministers to the needs of the whole family from grandmother down to the tiniest tot. It is hard to tell whom it affects the most, whether it is father or mother, the young people, or the children.

Let us consider for a moment just how it affects the farmer and the father of the family. Daily it brings him the weather report. Many times this knowledge for one day is worth far more than the original cost of the radio. In our section of the country, where that most valuable crop, tobacco, is raised, this knowledge at planting time and again at harvest is invaluable. Very often we have frost before the tobacco is all in; and with a warning many acres may be cut, piled, and covered with hay, to save. Everyone knows the part the knowledge of the day's markets plays in a farmer's life,—the poultry, beef, veal, butter, and egg markets all affect him vitally. At the present time nearly every broadcasting station devotes a certain amount of time each day to programs of interest to the farmer. Some have lectures upon poultry, the proper feed, how to increase egg production, incubation, and poultry diseases. Other stations have lectures on cows and hogs and some talk on co-operative marketing. These talks are practical and valuable—they are a new source of information and come into a farmer's own home at convenient hours. There are even setting up exercises early in the morning though most farmers still prefer to do their daily dozen to the tune the milk plays in the milk pail.

Mother, too, finds the radio a great help and a source of inspiration. With an extension cord she can have the loud speaker beside her in the kitchen as she bakes, scrubs, washes dishes, or irons. She hears many new ideas, some on efficient housekeeping, others on cooking, etc. She learns new ways to camouflage old food and make it appetizing. She obtains many new and tested recipes. She learns many items of interest to herself as the family dressmaker. She hears which colors are best for spring, just what the new styles are, how to make the children's clothes over from her own. She also has the opportunity to hear other things of interest to her as a homemaker—lectures on interior decorating, color schemes, refinishing of old furniture. Some stations have women's clubs and these broadcast interesting programs. She learns what other women throughout the world are accomplishing and does not have to leave her home to join in. These programs give her something new to think of, something to brighten her days, give her a new outlook upon life. She can accomplish her work easier and more efficiently as a result, for even the most disagreeable task may be accompanied by gay music. Thus the radio is assisting in removing the drudgery from the work of the farmer's wife.

The problem of keeping the young people on the farms is half solved with the installation of a radio. All young folk want a good time, and you can make it possible for them to have it in their own homes instead of in the dance halls of the nearby towns. The radio will furnish plenty of excellent music; let them invite their friends in, roll up the rugs, and dance in your home. They enjoy the radio in many other respects; the ukelele and harmonica music always appeal to them. They like to hear glee clubs sing and enjoy hearing other young people perform over the air.

It brings another opportunity to the country boy or girl who cannot get away to attend university or college. Several stations have recently installed "universities of the air." They bring courses and lectures upon various subjects—foreign languages, such as, French, Spanish, and Latin; courses in English, in music, in agriculture, and in many other subjects. Many a young person has yearned for just such an opportunity as this presents.

Even the children come in for their share of the pleasure of the radio. There is the story hour for the little tots and how they do enjoy these stories told each night. We farm mothers seem to have so little time to devote to telling stories. Most stations have clubs for their little listeners, and every child longs to belon a club of some sort. What a t they get when they hear their name read over the air. These c have programs that are construc and interesting as well. There organizations for the older childre well, from ten to fifteen years of The children of the farms so sel see the comic sections of the Sun papers but they may hear them over the radio and thus enjoy t in this manner. The children e music for special occasions such the patriotic music for Washingt birthday. There are even lullabie hush the little baby to sleep.

Everyone in the whole famil provided with something of en ment by means of the radio. It ca not only to the tastes of the indiv al but to the family as a wh There are talks on health, dis prevention, and warnings of epic

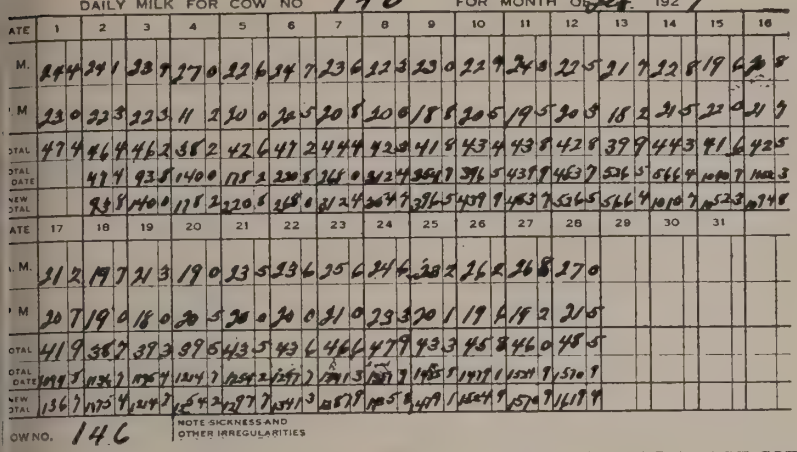
laking the Cow Earn Her Way

CURTIS F. MOSS, NEW YORK

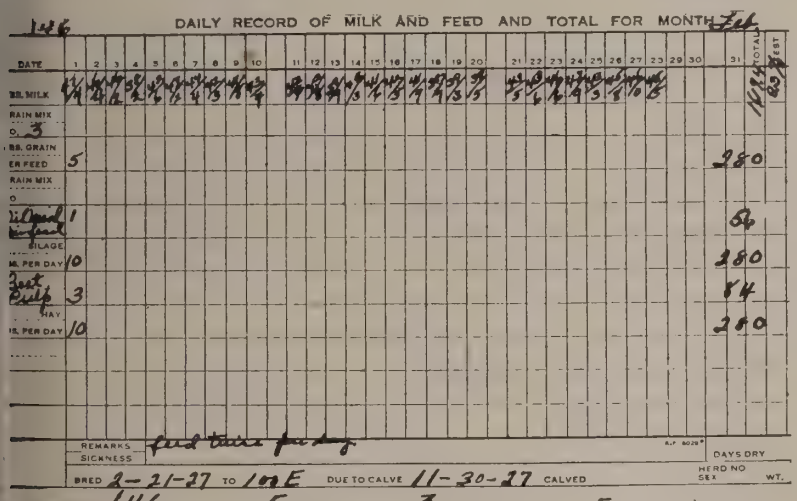
[ANY attempts are being made to operate records which will establish the basis for a de- n regarding the actual produc- y of a cow in comparison to her of maintenance. In other words, question is: Are cows paying way? It is probably one of the common in the dairyman's l. Under the direction of C. B. ler, assistant dairy husbandman; Fred Gauntt, dairy herdsman, Dairy Husbandry Department of New Jersey State Agricultural ege at New Brunswick, N. J., is ating extremely interesting and ful barn records. These records e originated at Penn State Col- by P. D. Jones.

ard A, here portrayed, is a daily rd of the number of pounds of given by each cow. It is divided two milkings. Space for three four milkings is oftentimes pro- d by drawing horizontal lines ugh the A. M. and P. M. sections.



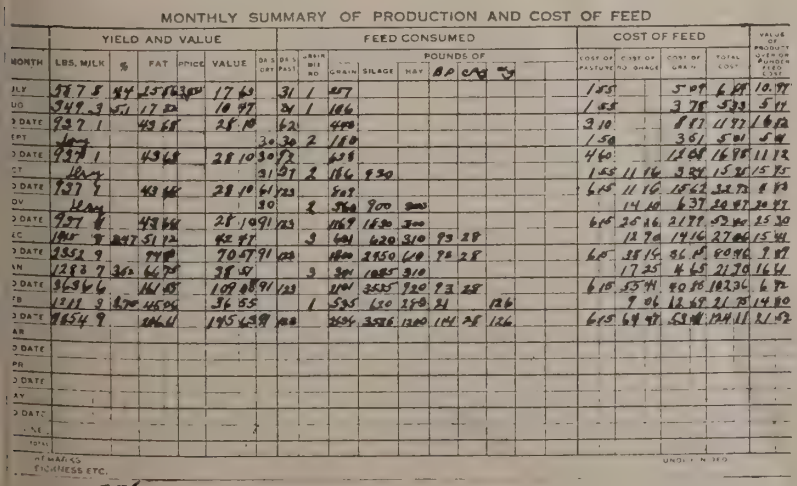
Records are kept in the barn where milkers post them after each milking. Totals are recorded each day, also totals to date. These two features are very important because in the majority of systems it is necessary to do a great deal of addition to find out "to-date" quantities.

Card B, the daily record of milk and feed and total for month, is kept in the barn office and taken out at feeding time. It is hooked on the feed wagon so that it is there in front of the feeder as he performs his duty and eliminates any chance of estimating or guessing. The lower portion of this record shows the amount and kind of feed to be given. On it is also written information under the headings "grain mix," "No.," "Lbs. grain per feed."



The amount of milk given daily is placed under the "Lbs. milk" caption. If there is any startling change in quantity figures, it may be immediately compared with the quantities of grain fed and a change affected if it seems feasible. Unless the feed is changed, the one posting under the date of the first suffices for the month. If there are changes, they are posted on the dates they occur and necessitate changes in the lower portion of the cards. The spaces for "Bred" and "Due to calve" are important as the amount of feed or milk will change when a cow nears the maternity period.

These first two records described are but incidental in importance to the third form, "C," which is the record of monthly summary of production and cost of feed. This is the determining factor in establishing whether or not the cow is "paying her way." Never before has the dairy husbandman been able on one record to bring together all facts necessary to establish a basis for decision. The card is very simple, showing the pounds of milk per month and its value, the amount of feed consumed and its cost, and the net gain or loss each month. This record is also accumulated because a one month's showing is no criterion for cows on account of their giving varying quantities, according to the time they calve. This record is, of course, permanently kept in the dairy herdsman's office and posted from cards A and B.



This complete and helpful system may be utilized by every herdsman. From the operation of a similar idea will come a complete knowledge of all existing conditions and a better control of standardized management.

CARD A—DAILY RECORD OF THE NUMBER POUNDS MILK GIVEN BY EACH COW

CARD B—DAILY RECORD OF MILK AND FEED AND TOTAL FOR MONTH

CARD C—RECORD OF MONTHLY SUMMARY OF PRODUCTION AND COST OF FEED

None!

No Long Tubes No Claws

The Surge Milker

You will NEVER know how *easy* a milker can be to wash UNTIL you have washed The Surge Milker. No Long Tubes! No Claws!

Ever try to wash a mess of long tubes and twisted claws? Try it once . . . . then try The Surge and *see how much easier it is! Another thing!* Long tubes and claws with their cracks, crevices, twists and turns are bacteria breeding grounds. The Surge has NO long tubes! NO claws! That's WHY Surge Owners find it so *easy* to produce clean low bacteria count milk and get premium prices.

6 Milkings FREE!

Right in Your Own Barn—With No Obligation to Buy

Don't buy ANY milker UNTIL you have tried The Surge Milker with its wonderful NEW method that milks cows like no other machine has ever milked cows before. Our liberal "6 Milkings Free" Offer lets you see for yourself just what The Surge will do for you—and there is no obligation to buy unless you want to. Once you see it milk your cows—even "that cow" you think can't be milked by machine—once you see how easy it is to operate and how much EASIER it is to clean—*you won't be satisfied until you own one!*

Easy Terms You can buy a Surge Milker on very easy terms. We'll figure to use any equipment you may have already in your barn. You'll be surprised how little it'll amount to. Mail coupon now. It doesn't obligate you.

Mail coupon now for special price, Free Demonstration and Easy Terms Offer. Learn what this wonder milker will do for YOU!

Mail Coupon for Free Book

We have just issued a NEW Surge Catalog that tells you MORE about milking and milking machines than anything you've ever read. It's a very valuable book for any farmer milking cows to have. This coupon will bring it to you—FREE.

Clothes Hints for Fall

We ran away the other day, my husband and I. We hired a neighbor boy to do the chores for a couple of days and we parked the children with my sister, though I am quite sure she failed to appreciate the honor we did her. Then we took our little Ford and started toward Chicago. It was almost noon when we left home and as we intended to take the longest route in we hastened on our journey. We took the route that led us through Sheridan Road and the Lakeshore Drive and it was a drive long to be remembered. As Chicago is at present living by daylight saving time we, of course, lost an hour going in, and arrived in the city just in time to catch all of the traffic of closing hours. For a man who drives year in and out along country byways, my husband got the biggest kick in driving through that traffic of any one I know.

We stayed with some cousins on the south side and the next morning we went down town and the loop. My husband, manlike, chose to spend his day seeing Babe Ruth play ball, but my cousin and I decided upon the theater and shopping. No one knows what a keen delight I take in the crowds of that city as they hurry and rush about. But really, nowadays it is a comparatively simple thing to get about in the city to what it was a few years ago, because of the way in which traffic is guided.

First, to avoid the afternoon crowds, we went to the theater and we chose the "Chicago," one of the finest in this country. The picture was good and the vaudeville was splendid. How different the vaudeville acts are today, that are given in these good theaters, from what they were a few years ago. The numbers that one hears in these theaters nowadays are similar to what we get at home on very fine chautauqua programs. But it was not in either of these things that my interest was centered. It was in the beauty and grandeur of the theater itself, and though I have seen it many times before I never tire of looking at it anew, and in its lighting system and organ that I revelled. I wish I might find words to describe the beauty of that building, with its spacious marble lobby, with its numerous oil paintings each one of which is lighted individually, its balconies, crystal chandeliers that glisten like diamonds, its beautiful chairs and settees of gold and tapestry, or the beauties of the dome of the theater with all its various hues. Then there is the stage itself set between two mammoth columns of marble and curtained in the most beautiful of velvets. But words fail me and I could never do justice to it. I am always interested in the effects produced by the lighting system as it varies the lights and tones of blue, violet, rose, green, orange, etc., upon the persons performing and the curtains. And the organ itself, or perhaps I should say the organs for this theater contains two, always holds me as nothing else can. Its voice, as it peals forth its mighty notes, carries one far, far away from his problems of the farm, with our worry over crops, stock, interest, and taxes. It takes one off to fields of peace and he drifts away in forests of beauty.

We left the theater and proceeded to one of the city's smartest grills for our luncheon. Next came the part I had waited for and dreamed of for many months, that of wandering through the large department stores, of viewing the beautiful things in each department and getting ideas for winter. For away back in the middle of summer one finds the winter styles being shown. I shall not try to tell you a quarter of what I saw but I am sure you will be interested in what those big stores were forecasting for winter.

The dresses shown were practically all of velvet in all of its richness and elegance. Navy and midnight blue, and black were the predominating colors shown and will evidently take the preference this year. Nearly everything was trimmed with a bit of tan, flesh colored, or biege colored georgette. Something rather different! Quite a few heavy crepes, such as roshanara, are being used also. All of the dresses are longer, three inches at least. I saw quite a few jacket effects being worn. One cute little dress had a plain skirt of black plaited serge and a black velvet jacket was used with it. Another dress that impressed me was a blouse of gold metallic cloth and a skirt of brown velvet. This was one of the richest things that I saw. It was perfectly plain, with no trimming. Many have just a touch of the flesh colored georgette at the neck or in vest effect. Many velvet hats were shown in blues, black, and brown. Hose for fall seem to be less in shades of tan and flesh as before and more in grays, many and many shades of grays, and in gunmetals. The smartest hosiery have black heels. Some hose are a beautiful shade of rose biege. Scarfs for winter will be brighter and gaudier than ever. Last winter they were bright but this year's will make those look very sober. The beads for winter are to be of crystal. I saw string after string of large crystal beads, most of them quite long strings in both round and square beads shown with the dresses of velvet.

Lastly I want to tell you of one window display that I saw, not that it showed the styles but because it tried so hard to reproduce a bit of the country. The background was made up entirely of paper flowers that would grow in an old fashioned country garden, hollyhocks, asters, nasturtiums, daisies, phlox, climbing roses, geraniums in pots, petunias, marigolds, sweet peas in profusion, and even little fir trees of paper. I suppose this is the nearest many city folk ever get to seeing flowers such as those that grow right in most of our own gardens.

We both returned to the farm ready to tackle the work with a new vigor and much the richer and happier by a change in the regular routine of farm work. Personally I believe it pays any one in big returns to take a few days off occasionally and to take a little vacation. It keeps us from stagnation. And as most of the city people have from two weeks' to a month's vacation a year, a farmer surely should have a few days.—ETHEL MORRISON MARSDEN.

Importance of a Farm Office

"Our home is a hotel, an office, a pedigree record library, and a seed corn depository," so writes a farmer's wife in one of the recent magazines. How many of us find our living rooms cluttered with pedigrees, old magazines that are treasured because of some helpful paragraphs on agriculture or live stock, sales catalogs, and all the other empedimenta dear to the heart of a man interested in keeping up-to-the-minute in his farm work, but distracting to the housewife who strives to keep everything in its place. I am going to tell how I have solved the problem during the past winter and how successful it is working out.

We are living in a more-than-100-year-old Pennsylvania Dutch farm

replied simply that "it was the
re that did it." As long as they
remember, the first sight that
greeted their eyes on waking had
a picture hung at the foot of
bed showing a beautiful ship
r full sail fighting its way
gh a stormy sea. It uncon-
sly came to represent romance,
nture—and when they were old enough to decide, their only desire was to go to sea.

I have never known a case where a single picture affected a life as vitally as this but I do know that being exposed to beauty, even the beauty of only a picture has a softening, enriching influence that is never lost. Particularly is this true in the early formative years, and that is why good pictures are so desirable an addition to schoolrooms. We who are not artists are apt to think that one picture of a tree is as good as another. We say, "Maybe this picture is not a work of art but it is good enough for me." Perhaps it is, but it is not good enough for your children unless it is the best.

"The best" in art sounds pretty expensive but there is a new organization for the promotion of art in the home which stands ready not only to instruct us in what is good but to help us get it, and get it with little expense. This organization is the American Art Bureau, 166 West Jackson Boulevard, Chicago, Ill.

The bureau has three small booklets, "The Pictures in Your Home," "Pictures for Schools," and "Outline of Art," which sell for 25c each. The last-named booklet is largely devoted to appreciation of art but describes also the service which the bureau offers free of charge to study groups. The service consists of:

1. Assistance in planning art programs for study groups for the year.
2. A loan exhibit of 42 beautiful color reproductions mounted on 24 cardboards. This collection is sent out at no expense to the study group except the cost of transportation. The trunk containing this exhibit weighs 130 lbs. so your local express office can give you the cost of sending it between your town and Chicago.
3. A loan collection of lantern slides showing the proper use of pictures in home decoration.
4. A typewritten lecture, written by an authority, accompanies each loan exhibit and may be read by a member of the group.

The booklet on "Pictures in the Home" deals with the selection of appropriate pictures for various rooms, how to frame them, and how to hang them. It is, I think, the least valuable of the three books as it contains only material that most of us have heard many times.

I like the other two books because they contain, in addition to a small study of art appreciation, valuable lists of the masterpieces of the best artists and while the bureau does not sell pictures, they will furnish addresses where any reproduction you want may be obtained, with its price and size.

I don't believe any of us need to be convinced of the value of having good pictures in our schools and homes. It is largely a question of whether or not we can squeeze another activity into our already crowded days. If you think you can, I don't believe you could do better than to get your club or school in touch with the American Art Bureau at the address I have given.—LUCY THOMPSON.

Cheese Pie

2 eggs
⅔ cup sugar
1 teaspoon salt
4 tablespoonfuls melted butter
¾ cup cottage cheese
⅛ teaspoon cinnamon
1 cup milk
¼ cup currants
Juice of ½ lemon

Put into a pie tin with an undercrust only. The currants may be put into the pie tin to insure even distribution. They should be pressed down under the surface. Bake in a moderate oven.—Household Nutrition.

Hoard's Dairyman Fashion Department

NOTICE—Our patterns also sell for ten cents each. They are accurate and satisfactory.

Why take *half* the Profit on YOUR WOOL?

When you sell your wool to a dealer, it is all ready for the factory. Why not send it there direct and get *all* the profit?

The Chatham EXTRA PROFIT PLAN pays you double for your wool. You just ship the wool to us — the country's largest exclusive makers of wool blankets—and we make it up into the best blankets and auto robes produced in our factory. The charge is nominal—or, if you prefer, we will take full payment in wool.

Mail Coupon for Booklet explaining EXTRA PROFIT PLAN.

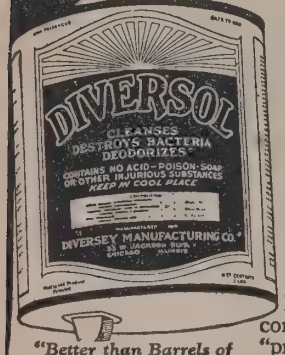
FREE 25 Gals. Enough Diversol To Make of Sterilizing Solution

Destroys The Bacteria That Cause Milk Trouble



Mail Today Diversey Mfg. Co. Dept. 28-56
53 W. Jackson Blvd., Chicago

See What Diversol Will Do for YOU

If mailed today—this coupon entitles you to enough Diversol—FREE—(Sent Free and Postpaid)—to make 25 gallons of Sterilizing Solution.

Name.....

Address.....

"Better than Barrels of Hot Water"

Avoid Hot Weather Milk Troubles

DIVERSOL

destroys the bacteria that cause:

Sour Milk "Ropy Milk" | "off flavors" foul odors

NOW! You Can Be Sure of Premium Priced Milk

Diversol now makes it *easy* for you to keep bacteria under control and *economically* produce clean, low bacteria count "premium-priced" milk. 85% of bacterial contamination comes from milk utensils and equipment. Diversol now makes it EASY for you to keep them fresh and clean and free of the bacteria that spoil your product.

MORE—*than a washing compound.* —*than a sterilizer.* It's both!

Diversol does *more* than any washing compound or sterilizer—it destroys bacteria as it cleans, and removes foul odors—instantly with ONE operation. You don't need steam. One warm or cold water rinse with Diversol—and you're through! You make your own solution—easily and quickly with cold water. *Very economical!* One pound makes 100 gallons of sterilizing solution. Keeps forever. Never deteriorates. Non-poisonous. Never injures hands.

Mail Coupon for FREE Supply

Every man producing or handling milk, cream, butter, cheese or ice cream should investigate this great NEW dairy discovery. The coupon above entitles you to enough Diversol—FREE—to make 25 gallons of sterilizing solution. Send for this liberal FREE supply—mail coupon now—SEE what Diversol will do for YOU.

FREE How to turn losses Cows Calves Poultry Pigs into Profits

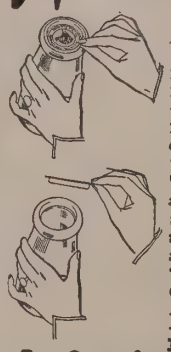
Every owner of Live Stock should get this FREE Book

Tells how to prevent and control diseases of cows, calves, pigs, poultry and other farm animals that cause yearly losses of over $200,000,000.

Tells how to PREVENT or Treat
Retained Afterbirth
Calf Scours

Also a full discussion of **Abortion.** Other chapters of the book cover Poultry Diseases and Little Pig Diseases.

A complete plan for sorting and disinfecting sows without catching or handling.



Write for Book Today

Gives full directions for preventing and controlling these diseases with B-K. Used on hundreds of thousands of farms. Cleansing and healing to tissue—non-poisonous yet a powerful killer of germs. Cost averages about a cent a gallon as diluted to use.

Costs little B-K Backed by Science and is reliable

DAIRY MARKET NEWS

Feed Market Situation

(By Grain, Hay, and Feed Market News Service, U. S. Bureau of Agricultural Economics.)

Feed prices made a further advance during the middle of August with several feeds showing a gain of $2—$3 a ton at the principal markets. Production of most feeds continued of only moderate volume and while demand was not materially increased the offerings have been readily absorbed even at the higher levels, even though farm pastures have continued substantially above average in nearly all states. High prices for corn have widened the outlet for feeds although this may be offset to some degree by the prospect for a bumper supply of hay at relatively low prices.

Wheat feeds have shared in the general advance although dealers at some points have been cautious, awaiting the outturn of the spring wheat crop. Considerably less wheat feeds have gone into storage this summer than ordinarily, according to trade reports.

Offerings of wheat feeds continued to be readily absorbed with the heavier feeds in urgent demand at a number of markets. Buffalo mills continue 2—3 weeks behind on shipping orders; offerings in central western markets have been hardly equal to current takings.

Linseed meal has shown a fractional advance again, due more to light production than to active inquiries. Demand was fair at Buffalo from both domestic and export buyers. Mills at this point were anxious for business but seemed able to move their output at prevailing prices. Quotations were also advanced at Chicago where production was light and demand was slightly more active. Production of this feed increased at Minneapolis but prices advanced, partly because of the steady gain in wheat feed prices which caused buyers to increase their purchases of linseed meal.

Cottonseed meal prices were irregular, being affected materially by cotton crop developments. Prospects are for a much smaller crop than that of 1926 which would mean that considerably less cottonseed cake and meal would be available during the coming season than last year when around 2,800,000 tons of cottonseed cake and meal were produced. Stocks of cottonseed cake and meal in crushers' hands at the first of August totaled nearly 65,000 tons. This is less than half of the 143,000 tons held at the same time last year but is larger than at this time for any year except 1922. Prices are materially higher than a year ago and demand is only moderately active at the advance.

Gluten feed prices show an irregular advance. Mill offers are only nominal and are for later shipment, generally not before October and current quotations are dominated by resellers' offerings. Resellers at Buffalo were asking about $2 a ton premium over the mill price quoted for later shipment and the offerings at Philadelphia were almost entirely from resellers.

Tankage continued to move readily at previous quotations of about $70 a ton in carlots at the principal distributing points.

Alfalfa meal held practically steady in spite of the strength in other feeds. Best grades were in light supply at Chicago but No. 2 and No. 3 alfalfa meal were available in fair volume. Light receipts of alfalfa hay caused some firmness at Omaha where choice and No. 1 meal showed a gain of around 50c. Demand continued inactive at Kansas City where reports indicated a fair inquiry for top grades. Dealers were complaining that heavy rains through Kansas and Colorado made it nearly impossible to get hay suitable for green meal.

Quoted August 24

Standard spring wheat bran: $31 Buffalo, $35.75 Philadelphia, $31 Chicago, $28 Minneapolis. Hard winter wheat bran: $33.50 Buffalo, $36 Philadelphia, $34 Cincinnati, $31.50 Chicago, $27.50 Omaha, $27.50 Kansas City. Soft winter wheat bran: $34.50 Buffalo, $36 Philadelphia, $34 Cincinnati, $30.50 St. Louis, $28 Kansas City.

Standard wheat middlings: $39 Buffalo, $43 Philadelphia, $38.50 Chicago, $35.75 Minneapolis. Soft wheat middlings: $45 Buffalo, $47.50 Philadelphia, $45.50 Cincinnati, $41 St. Louis, $39 Kansas City. Gray shorts: $45 Buffalo, $41.50 St. Louis, $40 Omaha, $39 Kansas City.

Cottonseed meal (43%): $44 Buffalo, Philadelphia, $42 Minneapolis, $42.60 Or $41.30 Kansas City, $35 Fort Worth.

Linseed meal (34%): $47.50 Buffalo, $ Cincinnati, $47.50 Chicago, $46.50 Minnea $51.10 Omaha.

Gluten feed: $38 Buffalo. White ho feed: $43.50 Buffalo, $44.70 Philadel $42.50 Cincinnati, $38 St. Louis, $41.50 C go, $39 Omaha. Alfalfa meal No. 1: $33 adelphia, $28.50 Cincinnati, $25.90 St. I $26.50 Chicago, $22.50 Omaha.

tter and Cheese in August

tter averaged 41.6 cents in New York for ust, which is practically equal to the July ge and August of last year but is nearly cents under 1925. Advancing prices ght out some storage butter and some mistic operators predicted that the ad- would check consumption or permit a free use of storage butter. Receipts for urrent year are some two hundred thou- tubs in excess of the same period for year and storage holdings are nearly a on pounds larger.

eese prices still retain an advantage over r, prices advancing a cent and a half g August. The average wholesale price he Wisconsin primary markets averaged 23.9 cents, which is three cents above August, 1926, and a cent above 1925. Unfavorable weather and feed conditions in the major producing sections have curtailed receipts at the warehouses and storage at the four principal markets is over a third less than a year ago.

Connecticut August Milk

The Connecticut Milk Producers' Association announces the following prices for Grade B milk delivered during August at market milk centers:

All milk sold in fluid form, 9.5 cents per quart for 4 per cent milk, and 4 cents per point allowed for other tests; all milk made into cream that is sold in fluid form, 22.5 cents per pound fat above the average monthly price of 92-score butter on the Boston market; all milk made into butter at a price per pound fat equal to the month's average on 92-score butter in Boston.

Twin City July Milk

The Twin City Milk Producers' Association of Minnesota paid $2.31 a hundred for 3.5% milk delivered in St. Paul during July. The association handled 26,721,543 lbs. milk, of which 54% was surplus.

Cream patrons were paid 48 cents a pound for butterfat in first grade cream during July. This is 6.3 cents above the average price of 92-score butter on the New York market.

Iowa June Butter

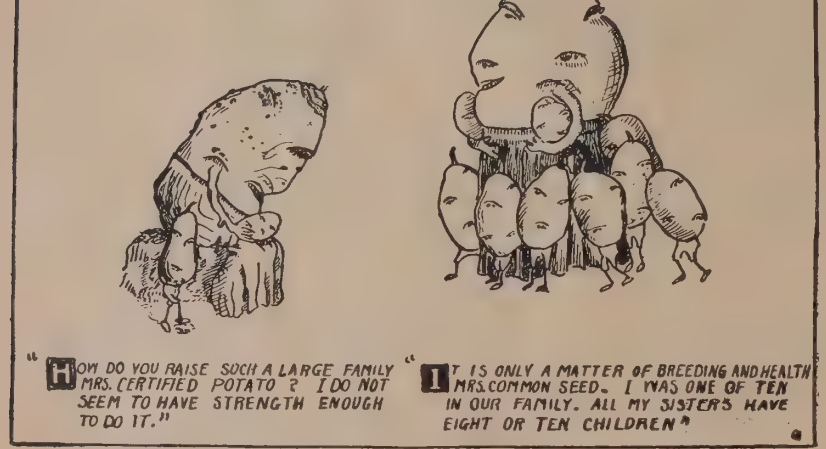
The Iowa Creamery Secretaries' and Managers' Association reports that for the local creameries reporting, patrons received 47.36 cents a pound for fat in June as compared with 45.93 cents in June a year ago. The price paid per pound of fat ranged from 43 cents to 51 cents, with the average fat handled per creamery being 46,193 pounds.

Sheffield July Price

The cash price for July, 1927, paid Sheffield producers for 3 per cent, Grade B milk in the 201—210-mile zone is $2.30½ per hundred pounds, with the usual freight and butterfat differentials. This is equivalent to $2.50½ for 3.5 per cent milk and is an increase of 9 cents over July, 1926.—C. W. HALLIDAY, Secretary.

League July Milk

The New York Dairymen's League paid in July a net pool price of $2.24 per 100 pounds 3.5% milk in the 200—210-mile zone. This is 11 cents above June.



HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Potato Study For Juniors

POTATOES have a place on nearly every farm. Many dairy farmers grow them as a cash crop. When not grown as a cash crop, at least enough potatoes are grown to supply the table.

Seed Selection—If you are going to plant seed next year that you have grown yourself, it should be selected before harvest time this year. In the field the vines should be inspected for disease and good growth. The more vigorous hills may be marked and dug separately. Potatoes from hills that produce the largest number of marketable potatoes are best for seed. Examine them for type, freedom from scab and other disease, and purity of breeding.

SELECT YOUR SEED FROM HIGH YIELDING, HEALTHY HILLS

Storage—Where should potatoes be stored? Three conditions are essential. They should be stored in a place where the temperature can be kept as low as possible without freezing, preferably between 32 and 40 degrees, in a well ventilated place where the air is as dry as possible; they should be kept where it is dark.

Crop Rotation—The crop which is harvested takes plant food from the soil. It has been estimated that a 600-bushel potato crop removes 160 lbs. each of nitrogen and potash, 60 lbs. of phosphoric acid. If we are to maintain the productivity of the land, we must maintain its fertility. This can be accomplished by applying fertilizers and using a good crop rotation. A 3-year rotation is used on many Wisconsin farms.

Land growing potatoes this year is seeded to small grain and a legume for next year. The third year it is hay land and can be manured and plowed under at the end of the season, when it is ready for potatoes or a crop of corn. Such a crop rotation keeps the land in good physical condition, maintaining the supply of organic matter which is just as necessary as proper maintenance of the plant food supply.

At the Minnesota Experiment Station, in growing potatoes over a ten-year period the growing cost where no manure was applied was 69c a bushel for marketable potatoes; where five tons of manure were applied the cost was cut down to 30½c per bushel. This application of manure every third year increased the yield 18.9 bus. for each ton applied.

History—The potato probably originated in the mountainous valleys of South America in Chile and Peru. The conditions there are similar to those in the mountainous valleys of Colorado and Idaho. In its native home, the potato grows at altitudes of 4,000 and 6,000 feet.

A monk, Hieronymus Cardan, is said to have carried potatoes to Spain from Quito, Peru, in the 16th century. From Spain the potato was carried to Italy and Belgium. Spanish explorers took the potato with them to Florida. From Florida the potato went to Virginia and other colonies and from there to the continent of Europe.

About 1585—86 potatoes were grown on the estate of Sir Walter Raleigh, located near Cork, Ireland. These probably came from what is now North Carolina. Switzerland, France, and Germany soon took up the potato.

Three Frenchmen are associated with the early history of this plant. The botanist, Olivier de Serres, wrote a chapter on the potato in a book which was published in 1600. M. Frazier named the potato, calling it *pomme de terre* in a book which he wrote about his travels to Chile.

M. Parmentier popularized the potato as an article of diet. For a long time after its introduction, people were skeptical of its use as a food. He secured the help of Louis XVI and had a plot planted to potatoes on the plain of Les Sablons. He had this plot guarded by soldiers so as to arouse the curiosity of the natives. When the crop was harvested, he served a dinner to leading scientists and influential men at which every dish was either made from potatoes or accompanied by potatoes.

Uses—In 100 lbs. of average potatoes there are approximately 75 lbs. of water, 19 lbs. of starch, 3 lbs. of sugar, and 1 lb. of fat and salt, and 2 lbs. of nitrogenous matter. Its high carbohydrate content—starch and sugar—make it a valuable food for man, which is its chief use. Potatoes are also fed to animals, cull potatoes being fed to pigs, and they are sometimes fed as a succulent to dairy cows. Large quantities of starch are manufactured from potatoes. They are also a source of glucose, which is a sugar for confectioneries. Industrial alcohol is manufactured from potatoes and in this form potatoes play an important part in the manufacture of varnishes, lacquers, the preparation of medicines, dyes, coal tar by-products, vinegar, imitation silk, smokeless powder, and fuel.

"Starch is the principal industrial product of potatoes in this country," says L. B. Flohr, marketing specialist of the U. S. Department of Agriculture, "but is made in relatively small quantities except when a larger than usual crop is produced, then, if the price is low enough, the starch manufacturers utilize a considerable part of the surplus. After making allowances for seed, say 10 bushels an acre planted, most of the crop is usually required for food."

Production—In 1926 the production of potatoes in the United States was 356,360,000 bushels. The five leading states and their production in bushels were: Maine, 36,830,000; Michigan, 29,880,000; Minnesota, 29,800,000; New York, 29,016,000; Wisconsin, 27,140,000.

Selecting Potatoes to Show

Often the one who grows the best potatoes does not win prizes because he fails to select an exhibit correctly.

A good exhibit must have potatoes of uniform size, shape, and color. Select those whose shapes conform to the type of that variety. Select those that are smooth, shallow eyed, free from disease and injury.

Select medium sized potatoes that are only a little larger than the average. Potatoes of the Early Ohio, Triumph, Early Rose, Burbank, and Irish Cobbler varieties should weigh from six to eight ounces each. In the eight to ten ounce class are the Rural New Yorker, Green Mountain, and Peerless varieties.

Do not wash the potatoes you are putting on exhibit but have them free from dirt; if necessary, use a soft brush carefully. Keep them dry. Most exhibits call for one peck.—Wisconsin Boys' and Girls' Clubs.

Clubbers at Camp Shaw

More than 400 club members from the Upper Peninsula of Michigan enjoyed a big week at Camp Shaw August 8—12 on the experiment station farm at Chatham.

The camp was in charge of Merton L. Wright and Miss Emma du Bord, assistant state club leaders. A. G. Kettunen, state club leader, and Miss Sylva Wixson, assistant state club leader, helped conduct the camp. "The Camp Shaw News," published daily on the grounds, was edited by George Harma. Gustave Thorpe was director of athletics for the boys and Edna Bowling of the Farmers' Wife had charge of recreation for the girls. Bernard "Chink" Eger has been the camp engineer since Camp Shaw was born. Several other leaders contributed to the success of the camp.

Instruction and recreation made a balanced program for the boys and girls. Classes were conducted by specialists in live stock, poultry, crops, home economics, and o subjects of interest to club mem The boys had some valuable fore lessons when they visited the fed forestry experiment station a miles from camp.

Evening features included the candle lighting service conducte G. L. Noble, secretary of the nati committee on boys' and girls' work, a wienie roast, and stunt ni

A tug of war across the Slap river provided much merriment last afternoon in camp. The were divided into Indian tribes the week and the competitio sports was very keen between t Each afternoon a red hot ball g took place in the senior and ju divisions. The climax was the game between an All-Star club m ber team and a Leaders' team, by the All-Stars 4 to 1.

There were two big musical f ures during the week. A 4-H band from Gogebic County under leadership of C. C. Mains gave se al programs and added consider pep to the camp. The R. E. community singing and individua strumental contests attracted gu and single entries from all of counties represented. Seventy dollars in cash prizes made the c petition keen.

Demonstration teams comp during the week for trips to Michigan State Fair. A pure-l Holstein heifer calf was offered one of the state institutions as prize for the dairy cattle judging test.

Eight years ago 67 club mem attended Camp Shaw for the time. The meals were served by i ferent families and organization the Upper Peninsula Experiment t tion. Today a fine big dining used as a farm machine shed the of the year, comfortably seats 400 clubbers at meal time. And fine meals as the camp cooks serve!

Carl Sturdivant, Craig County, a high individual in the junior d cattle judging contest. Carl was a ther honored by being elected p dent of the Oklahoma State Fed tion of 4-H Clubs. Other offi elected were: Helen Brown, v president; Elizabeth Wilson, s leader; and Paul Couch, yell lea Oklahoma. C. E. TROU

The total membership of 4-H c in the United States is as large as entire population of the state o Rhode Island.

Our Review Column

[A regular feature of the junior department, reviewing the contents of Hoard's Dairyman of the previous issue. Let's talk it over.]

For further discussion of the following see the August 25th issue.

What is New England's handicap? They are spending nearly $50,000,000 annually for the grain necessary to balance their dairy rations. This means an average annual outlay of $50 for every cow in the section. Their great problem is to grow more protein on the farm. (See page 791.)

How can they ease up their cow feed bill? By growing better roughage. By liming and sowing alfalfa in regions where lime is not used alsike and mammoth clover can be substituted to advantage.

What did Professor Haecker say about the physical tone of the dairy cow? Cows vary from year to year in physical tone. Some time in their life they will consume more feed and do more work than they have done at any other time. The usefulness of a cow can not be measured by any one year's performance. (See page 814.)

How was the Minnesota Station herd handled under Professor Haecker? Strict routine was observed. Feeding and milking were done at exactly the same time every day. The cows were milked quickly and in regular order. All animals were treated with kindness. (See page 792.)

Is there an opportunity in veterinary medicine? Yes. The demand for trained veterinarians is greater than the supply. (See page 793.)

Do trees protect buildings from lightning? No, they are not good conductors and add a danger when closer to the building than their height. Such trees should be protected with lightning rods. (See page 794.)

What is the record of the Farmers' Union Creamery? Located at Spencer, Nebraska, this co-operative creamery was organized in 1918 when 29 stockholders furnished the funds to get a little 600-pounds-a-week plant started. Today the organization boasts of 1,000 stockholders, 6,000 patrons, and an annual output of more than 2,000,000 pounds of butter.

How can rats be destroyed on the farm? Calcium cyanide dust may be used to advantage in open burrows in fields, along ditch banks, under sidewalks, around buildings, under pavements, in corncribs. The dust is used most effectively by means of a portable dusting pump with a flexible hose attached. (See page 801.)

What causes hog cholera? It is caused by a tiny organism commonly called virus, so small that it has never been identified by the best microscopes and it passes through the pores of the finest filters. (See page 815.)

How can hog cholera be prevented? By treating with serum and virus before the disease has invaded the herd. It may be done most economically immediately after the pigs are weaned.

FRIENDS—

You can make new ones by joining the

HOARD'S DAIRYMAN JUNIORS

THERE'S nothing quite like a good friendship—something "solid" about it, something satisfying. Silver and gold you may have little, but if you have friends, you are rich indeed.

Join the JUNIORS and start writing to boys and girls in other states, and other countries NOW. Exchange experiences and make your life fuller and richer.

How to Join—The requirements for membership are: (1) Some member of the family must be a regular subscriber to Hoard's Dairyman; (2) the age limit is 20 years. If you can meet these requirements fill in the application and send it in.

There's no time like the present to get that watch fob, creed, and pin, the emblems of a Hoard's Dairyman Junior, which we send you without cost as soon as you are completely enrolled. Sign up NOW and make new FRIENDS.

HOARD'S DAIRYMAN
Junior Editor
Fort Atkinson, Wisconsin, U. S. A.

Dear Sir:—

I hereby apply for membership in the Hoard's Dairyman Juniors' Club. I agree to read the Junior Department of Hoard's Dairyman regularly and do all I can to make the Juniors' Club a success. Will you please send me the watch fob [ ] or necklace [ ] (mark x) after your choice), the pin, and the Hoard's Dairyman Junior's Creed.

If so, what kind?.....

Junior Letters

Keeping Cows in Canada

Hoard's Dairyman Juniors:—We have 19 cows and a pure-bred bull. Five of our cows are registered Holsteins and the rest are grades. My father went out to 16 fairs last summer and won 2 silver cups, 140 first prizes, 34 seconds, 12 thirds, 12 diplomas, and 10 championships. It was one of my calves that won a silver cup.

I am in a competition in the Department of Agriculture in Winnipeg for boys and girls under 20. I have 6 cows entered as a herd. It started on January 1st and ended December 31st, 1926. Four of my cows had over 500 lbs. of fat. My address is Keyes, Manitoba, Canada.

Norah Hamilton.

Farming a Peat Marsh

Hoard's Dairyman Juniors:—I am going to tell you about our peat marsh. I think it is very interesting. We only broke it up last year but we had a good crop and as the rains were so bad last fall we had difficulty to gather all the vegetables. We had several hundred bushels each of onions, carrots, and rutabagas. We have about 25 acres in all and some was planted to grass, about 10 acres to potatoes, and about an acre to cabbage; also some cucumbers, peas, beets, peppers, some sweet corn and tomatoes near the edge where it is more sandy. We used a commercial fertilizer for all vegetables but some take different kinds and the small, garden vegetables take more than grass or potatoes. The fertilizer cost about $50 an acre. We planted some timothy and clover and we could not cut it last fall as it was standing in water.

My address is Anoka, Minn.

Donald Hastings.

Six Years in Club Work

Hoard's Dairyman Juniors:—I came to Wisconsin from New York in 1920. At that time the boys and girls were organizing a 4-H club. I joined it and took gardening as my project. In the fall I completed my record book and found that I made a fair profit. I joined the club the next year and took up gardening again and made a still larger profit and this encouraged me to a great extent. So I thought of taking up pig club work. With the help of our county club leader, who was Mr. Merton Wright, I purchased a pure-bred Poland-China gilt of Veva M. Divan. I took good care of the pig and as always kept up my record book. In the fall I received a letter from our state club leader informing me that I had won a free trip to Chicago to the National Club Congress and International Live Stock Show.

This show got me interested in live stock raising, so the next year I again took up pig club work. This year I was elected as the president of the club and got a broader view in civics as electing officers of our clubs, organizing clubs, how to help the community with 4-H club work, and how to make my work play. I completed the record book and sold all the Poland-Chinas and bought a pure-bred Yorkshire boar and got a high grade Yorkshire gilt. For this gilt I paid two young gilts from her litter. I had the same success as I did before. This year I took up calf, garden, and potato projects. Every year I completed my record books and did my best. Now this is my sixth year in club work.

In 1925 and 1926 I wrote in two essay contests and received first place both years and the prizes were free trips to the state fair for three days. I'm 15 years old. All the juniors who wish to write to me may address me at R. 3, Mosinee, Wis. Good luck to all.

Stanley S. Chmiel.

As sure as shootin'

THERE'S nothing like a hot, fat spark to start an engine. Eveready Columbia Dry Batteries provide sure-fire ignition at the lowest cranking speed. One turnover and the engine starts with a bang.

It costs less to buy, less to repair, less to own a farm engine equipped with dry battery ignition and Eveready Columbia Dry Batteries. These reliable batteries last, are inexpensive and easy to replace.

If you want ignition that won't fail in any weather, install Eveready Columbia Hot Shots in their steel water-proof cases. They will start a wet engine and keep it running.

Put Eveready Columbias on your engines now and they will be ready for dependable service whenever you need them.

Reeds Canary Grass

HOARD'S DAIRYMAN:—Reeds canary grass is attracting considerable attention in the Pacific Northwest. This grass is found in limited areas as far east as the Mississippi river. The largest area is found in Coos County, Oregon, according to the best information the writer can obtain. The origin of the grass in there is somewhat difficult to determine. Various stories are told. It seems most probable, however, that the early start in canary grass resulted from a small shipment of seed from the department of agriculture or from the Oregon Agricultural College. However this may be, the grass spread rapidly and is now one of the most valuable pasture crops to be found there.

Canary grass, as it is commonly termed, grows under exceedingly moist conditions. In fact, in Coos County the larger acreages are covered entirely with water during the winter months, due to the overflow and backing up of the water of the Coquille river. It is not unusual to observe a herd of cows in the early spring standing knee-deep in water, greedily pasturing on the tops of shoots of canary grass that stand a foot or more above the water. Although highly prized as a pasture in the Coos County dairy districts, for many years there was no appreciable spread of the grass until recent years. About four years ago plantings were made in the lake region of Northern Idaho and these have proven successful. In 1923 plantings were made in other counties along the Oregon coast, particularly in Lincoln and Tillamook. Plantings have also been made in Pacific County, Washington. Under the relatively drier conditions of the Willamette Valley good stands of canary grass have been obtained on the lower lands, particularly those subject to some winter overflow.

A new field of usefulness has now been opened up in Oregon east of the Cascade mountains. In Klamath and Lake Counties there are vast areas of marsh lands, almost always moist and completely overflowed at certain periods. In 1923 test plantings of canary grass were made in Klamath County along with some eight or ten grasses and mixtures. Under the conditions obtaining in the Wocus marsh district, where the test was located, the canary grass was the outstanding pasture crop in the trial. The acreage was considerably increased in 1924 with apparent success. Small experimental plantings have been made under much sim conditions in Lake County.

Although a wheat land crop, R canary grass is not a swamp gr It is a very palatable pasture many of the best dairy herds of County are on canary grass pas throughout the spring. It yields heavily, but this hay is not of the quality, being somewhat coarse.

he Wisconsin Dairymen's Association

HE premier position of Wisconsin as a dairy state is in no small measure due to the vision few men who met at Watertown ebruary, 1872, and organized the consin Dairymen's Association. that time farming was at a low Soil fertility had been exhaust- Men were moving into the more le prairies of the West, and the nt dairy industry of the state was ganized and without adequate kets. From that small meeting from that small beginning, and st at once, improvement set in the advancement was made. recital of the accomplishments of Wisconsin Dairymen's Associa- has been compelled to call upon its members to contribute $1.00 a year to the state wide work of organization and supervision of cow testing associations, this in addition to the expense these members are under to finance the major part of the work of the local association, amounting as it does to about a thousand dollars a year per association. The response of these members has been generous and has enabled us to do a work for the state of Wisconsin and the several cow testing associations that would otherwise have been impossible.

Our members may well take pride as contributing materially to this constructive work of a state association

CATION OF WISCONSIN'S COW TESTING ASSOCIATIONS ACTIVE APRIL 1, 1927

is interesting reading. Briefly ed: It was responsible for securtrade outlets in the early days promoting better products and er production methods. Largely ugh its initiative, the farm instis of the state were inaugurated, irst dairy school was established, Dairy and Food Commission ted, and the dairy legislation of state perfected. It organized the cow testing association in Wisin in 1906 and has ever since responsible for the expansion supervision of this work. Its ion throughout the years has to urge the dairymen to keep er cows, to give them better care, roduce a better product, to protheir market from fraudulent petition, to improve their marketmethods and their trade outlets—o the end of producing better ts, a sounder industry, and the ling of better homes and a better e life.

its work the Wisconsin Dairys Association has had the hearty peration of the United States au of Dairy Industry, the State ge of Agriculture, the county ts, and its farmer members geny. It has been the good fortune isconsin to have had men and intions interested in the dairy iny who have been able to work ther unselfishly for the advancee of her biggest and basic indus-

at this work might advance, the onsin Dairymen's Association that has over a half century of history replete with constructive work for the dairy industry of the state.

On January 1, 1927, there were 837 cow testing associations in the United States, with 21,128 members having 362,014 cows on test. On the same date Wisconsin leads all states with 159 associations and 4,194 members having 64,897 cows on test, or nineteen per cent of all. Michigan comes next with 102 associations and 2,449 members having 26,511 cows on test.

Since the organization of the first C. T. A. by the Wisconsin Dairymen's Association in 1906, the test of merit and profitableness has been put on nearly 700,000 cows. During this same period the average production of all cows in Wisconsin has been increased 26% and still the average Wisconsin C. T. A. cow has a production 50% greater than the average of all cows in the state.—From Annual Report of Secretary Burchard.

Milwaukee Dairy Consumption

In a rather pretentious booklet entitled "Consumer Analysis of the Greater Milwaukee Market" the Milwaukee Journal (Wisconsin) presents a survey it has made of the kind and quality of foods consumed by the people of that city. There are several things in this survey that were of interest to us, particularly the statements concerning dairy products.

There were 28 different retail milk plants listed, but one dealer is credited with 54 per cent of the total milk. The most startling statement, however, is that there has been an apparent decline in milk consumption in Milwaukee of 300,000 quarts monthly as compared with 1925. This represents a decrease from 42 quarts per family in 1925 to 40 quarts per family in 1926.

In its report as to butter it advises us that 77 per cent of the families use print butter while 40 per cent use either tub butter or a combination of print and tub butter.

The increased use of process cheese is one of the outstanding factors of the report. During 1926 better than 50 per cent of Milwaukee families used this type of cheese.

Milwaukee apparently likes ice cream as each family is credited with an annual consumption of 92 pints of brick ice cream and 85 pints of bulk ice cream. The total consumption of brick and bulk ice cream is given as 9,000,000 quarts. One dealer is credited with 90 per cent of the total sales of the brick ice cream and 87 per cent of the bulk ice cream.

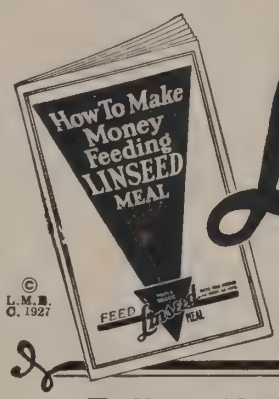
How Much Profit *per Cow?*

With any grade of stock, the answer depends on the way you feed . .

Thousands of dairymen in the cow testing associations have learned this about profits: It isn't the number of cows in your herd — it's the profit per head that counts!

Feed records on these thousands of herds prove that better feeding is the key to profitable dairying — that the only way to beat market conditions is by cheaper production through tested, successful rations. Nine times out of ten, these rations include Linseed Meal.

The up-to-date booklet on stock feeding — "How to Make Money Feeding Linseed Meal" — includes complete facts on the rations which have enabled these farmers to build up their profits *per cow.* It's a gold mine of information on successful herd management under the conditions you face today. Sent free. Mail the coupon now.



This booklet has brought dairymen thousands of dollars in increased profits.

Sent Free!

To breeders: Your market can grow only as dairymen learn to handle better-bred stock profitably. Get behind this movement for better feeding!

Plan *now* your MILK PROFITS for Winter

Look over your prospects for improving milk profits this winter. You know, by now, what roughage you will have—see, below, how there is a Quaker Dairy Ration to meet any situation, each of these feeds being exactly the protein concentrate that fits its indicated purpose. See the Quaker Dealer—arrange now for your winter supply so that you can avoid losses due to changing feeds.

Select the feed that fits your farm, your herd

Quaker Boss 24% Dairy Ration is the ideal grain ration for cows receiving timothy hay, grass hays, straws, corn stover or other poor grades of hay.

Quaker Big Q 20% Dairy Ration exactly meets the need of those herds receiving poor alfalfa hay, fair clover hay, or real choice mixed clover and grass hay.

Quaker 16% Dairy Ration has no superior when cows are receiving choice clover hay, good alfalfa hay, or an excellent grade of fine mixed grass-and-clover hay; it is a good ration for dry stock and for young growing stock.

Quaker Sugared Schumacher Feed has a real place when the herd is receiving liberal quantities of choice alfalfa hay. It combines beautifully with any Quaker high protein feed. It is an ideal ration for all stock—dry stock, young growing animals, horses, sheep, swine, steers.

All Quaker Dairy Feeds contain molasses in dried form and are rich in the minerals cows must have to make milk.

Send for the FREE book—"The Dairy Herd"—It tells you just how to meet the feed requirements of your farm, your herd.

Opinions, Brickbats, and Bouque

These columns are open to the readers of Hoard's Dairyman for the expression their opinion on any subject, whether radical or conservative, destructiv wise or foolish. It may be cows or crops, religion or politics, or what at the time mo interests you. It may be critical or commendatory, but it should be your opinion. It your own editorial page but your editorial must not exceed 250 words. Hoard's Dairyma assumes no responsibility for opinions expressed.

The Mississippi Flood

HOARD'S DAIRYMAN:—While most of you folks in the North realize in a general way that the Mississippi River Valley has had a flood, yet I am quite sure few of you can conceive the vast extent of the damage.

At this writing (June 4) some 8,000 square miles of rich, fertile soil in Louisiana is still inundated, and will continue to be for some weeks yet. Fortunately we, living on the east side of the river, have escaped damage, but the great "sugar bowl" of Louisiana is under water and crops wiped out.

The government has been lax in its handling of the Mississippi River problem but the disaster of 1927 will surely bring matters to a focus and steps taken that will make a recurrence impossible.

The local state government has not the resources to handle the situation. The lower river is the bottle neck through which the waters from more than a score of states must pass on its outlet to the Gulf and the problem surely is national.

The flood menace has been one of the most serious factors retarding the development of the lower Mississippi River Valley with its wonderful soil and favorable climate and long growing seasons, and the unprecedented flood of this year may prove a blessing in disguise by eliminating a great menace and establishing a confidence heretofore not existing.

Corn in this section is good and starting to tassle; second cutting of alfalfa is already in and it is necessary to clip pastures with mowing machine in order to keep down the rank growth of pasture grasses, most of which is allowed to remain where cut for lack of labor and barn room for making and storing the hay.

We have had white clover in abundance continuously since last fall but it will soon go to seed and give away to Bermuda and other summer grasses to come again in the fall. Potato crop was harvested several weeks ago with good yield and profitable prices. Winter and spring movement of vegetables was heavy.

The great need of this section is more dairying. Probably in no other section of the United States can dairying be conducted more profitably than in Southern Louisiana, once the industry is put on a proper basis. We need more creameries, milk condensing plants, etc., to take the product of the small dairyman. At present the principal market is fluid milk for the cities with that market flooder periodically, resulting in low prices and unsatisfactory marketing conditions generally. Also this country needs more small farmers; too many large plantations with lazy, goodnatured, harmless negro labor, and attendant economic evils and inefficiencies.

But the future looks bright, indeed. Agriculture is gradually finding itself and working out its own salvation; good highways are connecting us with the rest of the world; tick eradication is making it possible and profitable to bring in and raise improved live stock and one of these days Southern Louisiana will be famous as a "Garden Spot" spelled with gigantic letters.

We have been milking around 85 cows (three-fourths of them have raised heifers) this spring and have averaged about 280 gallons per day production, with a total feed cost cluding home grown feeds at ma value) of about 7 cents per ga

Louisiana. C. W. DAV

Cartoons

HOARD'S DAIRYMAN:—In loo over the June 25 issue of your j nal, we find an article on page pertaining to co-operative marke This is a splendid article, but is s what spoiled by the cartoon ac panying the article.

It has been the custom for a many years to picture a farmer high boots and long whiskers. W lieve that down around Boston New York there may be some f ers look like this, but there are of them in the Central West.

The writer has been selling g to farmers for the last twenty y and has reasons to believe that tures of this kind are very muc sented by real farmers. We fi believe that as soon as such pict are left out of especially farm pers, there will be more of them by the farmers in the Central V Many farm papers and daily n papers throughout the country, sides yours, are still using such toons, but we are giving you our of how the farmers feel abou This is given hoping that it wil taken as constructive criticism.

Texas. W. F. BARTRU

Talk Milk

HOARD'S DAIRYMAN: — Lindb flew from New York to Paris in hours. We all remarked about ho was able to accomplish such a str ous feat alone by himself two and one night. The drone of a tor continuously gets so it so like music and is enough to put ordinary man to sleep. But di sleep? No! Did he use stimul to keep awake? No! He had s chicken sandwiches and a the bottle of milk. When he lande Le Bourget he landed amidst st lants—wine, brandy, champagne, we'll leave the rest up for the n papers (they had a complete l But did he want their drinks? stead he asked for a glass of Now, folks, here is where the n papers get in wrong, they never st whether they had it on hand.

This is one of the greatest op tunities the dairymen of the w ever had. Boost milk and its p ucts. When people talk saloon liquor, talk milk and Lindbergh. has given us food for thought. let's keep it moving.

W. G. KIRKPATRICK, Teste Michigan.

Why More Land

HOARD'S DAIRYMAN:—Your edi al, "Why More Land," in the 25th issue offers the best solu for the farmer's troubles I have seen. May your leadership enc age others to take a similar s along this line.

In these days of overproductio agricultural products it is beyon to see how any agricultural ag can have the audacity to encou further production by putting use more and more waste or s waste land upon which no man make a decent living. The real for the future of agriculture lie the elimination of all land which no profit can be realized.

Wisconsin. JOHN MICHEL

Life and Work of T. L. Haecker

(Continued from page 828)

iment and from these tables were structed.

'rofessor Haecker described this k in these words: "During the e when the feeding experiments in c production in review were in gress, it occurred to the writer t in order to determine the actual nutrients required to produce a n animal product, the composi- of the product should be known well as the composition, and the ilable nutrients in food which is e fed for its production, so that nutrients in the ration might be vided in the proportions needed by animal. Before a builder bids on ntract, he determines the quanti- eeded of each of the materials are to appear in the structure. hout such specifications he would know how much of each of the erent materials would have to be vided.

Fat Content and Nutrients

We learned, through the agency he Babcock milk test, the amount utterfat contained in milk of va- s grades and the chemist could de- nine by gravimetric analysis the ious components in milk, but ap- ently it had never occurred to him ivide milk into specific grades and rmine the average composition of , at least no such table was wn to the writer. This seemed es- ally strange, since for nearly half entury protein requirements in ling for milk production have been chief problem.

This matter was presented in Jan- y, 1903, to Professor Harry Sny- Chief of the Division of Agricul- l Chemistry and Soils, and ugh his kind offices arrangements e made for the analyses of com- te samples of milk from the dif- nt cows used in the feeding ex- ment. This work was continued to close of the year 1907.

t has been shown that there was emarkable uniformity in the net iment required for the produc- of a unit of milk solids when nu- nts consumed and milk solids pro- d were reduced to carbohydrate valent. The milk solids are com- d of butterfat and solids not fat. organic solids other than fat are r and protein.

n Bulletin 79 of this station, pub- d in January, 1903, it was clearly n that cows need net nutriment heir rations proportionate to the ity of the milk as measured by fat content. It also appeared that richer the milk in fat, the more protein was consumed per unit of produced. Whether this was ly incidental because more nutri- t was required as milk increased at percentage, or whether more ein was required because there more protein in the richer milk, not appear because the relation of ein to fat in the various grades of was not known.

justing Ration to Milk Protein

ls the protein content of the food aintenance was adjusted to the 's of the animal for the mainte- e of the body, so must the protein he production part of the ration djusted to the protein content of milk.

n order to make such adjustment ible, it was necessary to find the ein content of milk of the various es, as measured by the fat con- by making a gravimetric anal- of a large number of samples of and grouping them in specific es. It was also necessary to de- termine the average composition of the samples of the various groups instead of finding the average composition of all samples of milk analyzed as had been the custom.

"The milk was divided into 10 grades. That testing under 2.75 per cent fat was put into the 2.5 grade, from 2.75 to 3.25 into the 3 per cent grade, from 3.25 to 3.75 into the 3.5 grade, from 3.75 to 4.25 into 4 per cent grade, and so on to the 7 per cent grade. By this method a sample did not vary more than a quarter of one per cent from the average of its class."

Sudden Changes in Feed

From practical experience you have probably learned that it is not a good plan to make any sudden changes in the winter ration of your dairy cows. Here are Professor Haecker's early observations on this problem: "Our records show that radical changes in feed during the winter are objectionable, as changes generally cause shrinkage in milk. A more uniform flow is maintained by feeding the same ration all winter, if possible. If it becomes necessary to make a change, it should be very gradual, so the system can adjust itself to the variation in bulk and the muscular action required by the stomach to digest that particular ration."

[EDITOR'S NOTE:—This concludes the Life and Work of T. L. Haecker.]

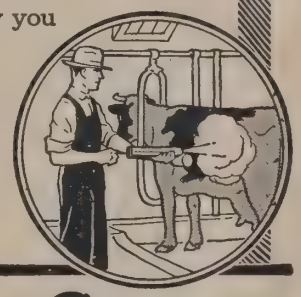
Uncle Ab says imitation is good if we imitate the right things.

ESTABLISHED REX 1896

This animal spray has new and different qualities

Rex STOCKAID is the newest scientific development in the famous line of Rex insecticides and agricultural sprays.

Due to its outstanding qualities, Rex STOCKAID is already in popular demand among cattle owners.



Rex STOCKAID is a double purpose spray. When sprayed, Rex STOCKAID kills every fly, mosquito and flea it touches and protects animals from 6 to 12 hours after spraying. Rex STOCKAID is stainless to the hide or hair, has a pleasant odor, will not burn, blister, irritate or harm the hide. Does not gum the sprayer or hair—leaves coat fine, nice and glossy.

Rex STOCKAID will not taint milk.

Like all Rex products, STOCKAID is fully guaranteed. Money back if it fails to kill and repel those biting, buzzing, irritating insects which reduce milk production and retard normal animal growth.

Rex STOCKAID is produced by the makers of FLY-TOX, RAT-TOX, NuREXO, AFI-TOX and other Rex insecticides and fungicides.

Your retailer can supply you with Rex STOCKAID.

er from churches many hundreds miles away. Thus they can join h the congregations of some of the gest and most up-to-date churches this land of ours. They can listen some of the greatest ministers in s country. The messages sent in s way reach many thousands who uld never otherwise be reached. ıly the radio is a wonderful bless- to the country home and those hin it.

EDITOR'S NOTE: Mrs. Ethel Morri—Marsden was born in Chicago, now lives upon a farm in Dane nty, Wisconsin. She is a fine il- tration of a city bred girl making od" on the farm. In transmitting s article to us she wrote: "The in- ation to write this seized me while as in the midst of frying a batch loughnuts and, needless to say, my t doughnuts were far superior to last in that batch, for I sat beside range writing and frying alter- ely."]

sponsibilities of Directors

A director of a co-operative associon normally occupies a position responsibility and liability. This es from the fact that the corpor- powers of an association are in directors, that is the directors of association collectively and pri- ily possess all the powers that the ociation has under the law. It is e that these powers are executed he officers, agents, and employees he association, but the "constitu- " for their acts is the board of ctors. They determine, either ressly or by implication, directly indirectly, the acts, plans, and hods to be performed or followed he officers, agents, and employees he association.

is the function and the duty of ctors of an association to direct supervise in a fundamental way activities of the association. Neg- nce on the part of a director in discharge of his duties with re- t to the management and conduct he association may render him e on account thereof. The di- ors of an association are not in- rs of its success, but they must cise fidelity and reasonable care onducting the business.

ne of the first propositions con- ting directors is the matter of ensation for themselves. Unless statute under which an associa- is formed, its articles of incor- tion, or by-laws authorize di- rs to fix their salaries or deter- their compensation, they do not such authority. It is possessed ne members of the association. th the directors and the officers corporation are presumed to act out compensation in performing luties of their offices, unless pro- n for compensating them has made. But if any of them are ing regularly for the association respect to matters not involving duties as directors or officers, it be assumed that reasonable com- ation will be made by the asso- n for such services.

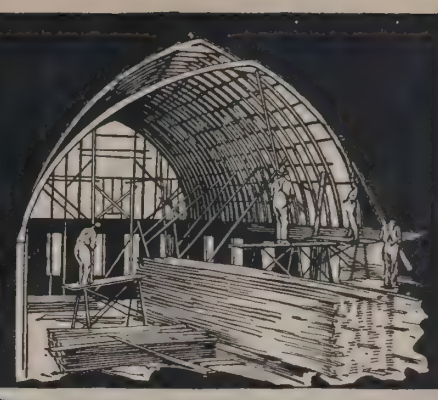
order to bind an association, the l of directors must act at a ar or a special meeting called he purpose. In other words, the is established that in matters af- ng the property or policies, or ving the exercise of discretion, irectors can bind the association when acting in a properly con- l meeting of the board. A ma- of them acting as individual tors, or in a "board meeting" l for any reason, can not bind ssociation. Action by directors at an illegal board meeting may be adopted and ratified at a later legal meeting of the board, but directors who were not notified of a board meeting can not later, as individuals, waive the failure to give notice or concur in the action taken at the illegal meeting so as to bind the association. If a director has notice and fails to attend a board meeting, his absence does not affect action taken, provided that a qualified quorum was present.

A quorum of the board of directors of an association at common law and in the absence of a statutory charter, or by-law provision changing the rule, is a majority of the directors of the association who are not personally interested in the subject before the board. If a majority of qualified directors, or the number, if any, specified in the statute, the charter, or the by-laws, do not attend a duly called board meeting, any business transacted by the minority at such meeting is void. Directors can not vote by proxy, but if a qualified quorum is present at a properly convened board meeting, a majority thereof at common law may exercise any powers vested in the board of directors. All of the directors constituting a quorum must be qualified to act. If one of the directors whose presence is necessary to constitute a quorum or whose vote is necessary to constitute a majority of a quorum is disqualified by reason of his personal interest, any act done by the body is at least voidable. Therefore, if a resolution is adopted on a vote of interested directors, the resolution is voidable at the option of the association if timely action is taken with respect thereto.

In some jurisdictions, if a member of a board of directors votes upon a proposition which is adopted in which he has a personal interest, the action of the board may be set aside by the association, although the resolution apparently would have been adopted without the vote of the interested director.

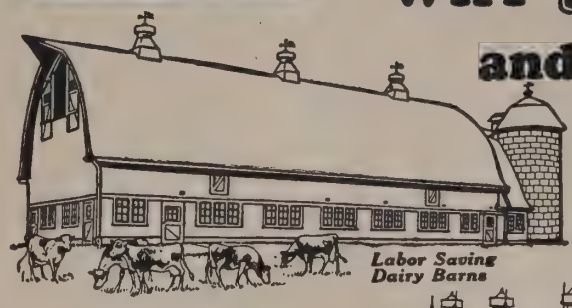
If a director acts in a matter in which he has a personal interest, the court will not pause to inquire whether the director acted fairly or unfairly; being interested in the subject matter, the courts hold that he may not as a director deal with himself and thus be subjected to the temptation to advance his own interest. Directors and officers of any corporation, co-operative or otherwise, may be compelled to account for any gifts, gratuities, or bonuses received by them from persons with whom the association is or may be having business relations. The object of this rule like the others akin thereto, is to enable corporations to have the "judicial judgment" of their directors free from any suggestion of bias other than the welfare of the organization.

In many, if not all, of the states, the state constitution or state statutes impose liabilities upon directors. For instance, in some states, if the directors of an association fail to file a report required by a statute, they are personally liable to creditors. Directors of co-operative associations should ascertain the duties and liabilities imposed upon them and should govern their actions accordingly. In this connection it is not sufficient ordinarily simply to examine the co-operative statute of the state, but the constitution and general statutes of the state should be carefully examined.



Aside from the liability imposed by statutes as indicated above, directors may render themselves liable through inattention to, or neglect of, the business of the association.—L. S. Hulbert in Agricultural Co-operation.

California Guernsey Record



Clarabelle of the Rancho, a Guernsey cow owned by Brant Rancho of California, recently completed a Class AAA record of 12,458.6 lbs. milk, 568.1 lbs. fat, the fourth highest record in that class. She also holds fourth place in Class EE with 723.3 lbs. butterfat.—The American Guernsey Cattle Club.

TELLS WHY Jamesway COSTS LESS and Saves Costly Mistakes

Labor Saving Dairy Barns

If you are thinking of building, remodeling or ventilating a cow or horse barn, hog or poultry house, or if you are considering the purchase of labor and time-saving equipment for such buildings, by all means, fill out coupon in this advertisement and let us send you free our valuable Jamesway book.

This book will show you how you can save money and have your buildings planned and equipped so that they are most convenient and practical. If you will avail yourself of Jamesway service, you'll have the same gratifying experience as H. L. Hartly, Manager of Island Farms, Duluth, Minn. Here's what he writes:

"We very much appreciate the splendid architectural service you have rendered us. The ability you showed to adapt plans to meet results desired were a revelation to me. Your suggestions saved me considerable in material and time."

Our many years' experience in planning and designing farm buildings enables us to save you money on materials and construction—show you how every door, window and general arrangement should be to make buildings convenient.

This book also tells you all about Jamesway Equipment—Stalls, Stanchions, Drinking Cups, Litter Carriers, etc., for the cow barn. Troughs, Waterers, etc., for hog houses. Feeders, Nests, Incubators, Brooders for the poultry house—a complete line of every kind of labor-saving, money-making equipment for any farm building. Jamesway Equipment is better and costs less in the long run.

Mail coupon today. Tell us just what you are interested in—whether building, remodeling, ventilating or equipping cow barn, horse barn, hog or poultry house, and we will send you the book that tells you just what you want to know.

India's Peaceful Revolution

(Continued from page 829)

The usual shortening used in India is clarified butter—that is, butter boiled until all the water has evaporated—a most wasteful process. But here at the show there were nice clean churns turning out nice clean butter of a very different color from that of the Indian milkman who usually pats out his butter in a nice ball, and if a few leaves and twigs and a great deal of dirt is included, what matter?

There are several months even in a normal year when the Indian farmer has nothing to do, and when rains fail and he cannot even sow his crops he can only sit idlè and twirl his thumbs and ruminate on his bad luck. Economists are trying to interest the farmer in subsidiary industries and occupations, and that is one reason why Mahatma Gandhi is insisting on spinning and weaving. So there were demonstrations in beekeeping, poultry raising, and various cottage industries. Cheap looms, so simple that the village carpenter can repair them and make spare parts, were shown in operation, turning out cotton cloth which was quite good enough for ordinary villagers' wear.

When the blight comes on the crops, or the rinderpest on the cattle, or smallpox in the family, the Indian is wont to go to the family priest and try to find out what has displeased the gods. Mayhap he will have to sacrifice a goat before the curse is removed. But here at the show there was a court showing the treatr of crop pests, the cure for cattle eases, and the prevention of sr pox by previous vaccination. the white man must be in le with the gods, for he can confer t boons without ostensibly invokin vine aid by means of sacrifice o cantation or charm!

And there was much to see was not strictly utilitarian. In amusement court were varied sl —a baby elephant playing tricks putting a garland on the neck white lady; Indian wrestlers; a n cal ride by the governor's hands ly mounted bodyguard; a Boy S display. And for the kiddies t were 4 cent rides on camel bac elephant back. Then there were tures and moving pictures on va subjects for the more seriously-n ed visitors, and tea booths for ferent castes and sticky sweet- stalls.

Yes, it was a huge success. passes on the railway and into show were granted to thousand agriculturists, and the railway panies played up generously a concession rates both for passen and for the transport of live s and apparatus. The result was innumerable villagers took for first time in their lives the revolu ary step of venturing away their homes into a great big co ing city, amid strange and dange folk and strange and dange things. It was amusing to w them—groups arriving by every t and from every direction. An cer would meet them at the st and pilot them in single file—a man with his little trunk and bed dle under his arm or on his head the school or hall or barracks w had been turned into immense mitories for the occasion.

And as the closing day of the came round, tired but happy gr could be seen trudging back tow the station, simply full to the j of saturation with the wonders had tried to absorb, and each guarding carefully any treasure had acquired. Each specially in guest carried home a memento o show in the shape of a fruit p Some had indulged in articles strictly calculated to improve agriculture or raise their econ standards, such as brilliantly co tin trunks—pink or red or yello purple—picked out in gilt lines. one man carried on his turbaned the sounding box of a gramop and in his hand the pale green f horn that belonged to the outfit.

Just try to imagine the knowl that has thus permeated into re and stagnant village communities jolted people out of the letharg the centuries. Round the village that serves as club house in the evenings gather groups of men sm their home-made cigarettes and c ing their betel-nut, and expati volubly—and no doubt with mar embellishment—on the magic o Bombay Presidency Agricul Show.

Dairy Production in Cand

The production of creamery b in Canada in 1926 amounted to 7 156,375 pounds, an increase of n nine million pounds over the pre year. The average price per p for butter at the creamery was 1. cents, compared with an avera 37.17 cents in 1925.

The production of factory chee 1926 amounted to 170,633,781 po a decrease of 6½ million pounds c the previous year. The average r per pound at the factory dr from 20.65 cents in 1925 to 3. cents in 1926.

On the heights of contentment . . .

MODERN smokers have in Camel such tobaccos and blending as were never offered in cigarettes before, regardless of price. Camels may be had everywhere—because they please the taste of smokers everywhere. Money cannot buy choicer tobaccos than you get in this famous cigarette, and the blend is so mellow and smooth that there is never a tired taste, no matter how many you may choose to light.

The producers of Camel, the country's largest tobacco organization, concentrate all their purchasing and manufacturing resources in this one brand of cigarettes. Into it goes their undivided pride and skill to produce such a smoke as the world has never known before.

The result of Camel's quality is its leadership among cigarettes. Modern smokers, won by its choice tobaccos, by its ever-dependable taste and fragrance, have awarded it first place. You're invited to modern smoking enjoyment.

"Have a Camel!"

iat a Quart of Milk Costs

(Continued from page 827)

and wash their udders and s before every milking. There a lot of little tricks to game that have to be learned re the kind of milk that peo- want can be produced. For in- e, we always feed the silage af- ve do the milking because it will the milk taste funny if we feed fore. We use a lot of straw and ings for bedding to help keep the clean. We keep the bacteria t down much lower by keeping the first milk that comes from cow. We feed that to the cat." never knew there was so much to milking cows."

)h, yes, and a lot more, too. It me .44c a quart just to buy , and I am much lower than the age of .70c on that item. We to have high producing cows will pay their way. Some cows eep only a year or so before they ad, and some we keep for eight n years."

With all that equipment in the house, I shouldn't think the la- costs would be very much."

My milk house costs are 1.32c a t and the college chap itemized this way:

ng milk	.35	cents
ng and capping	.17	"
ng and icing	.05	"
ng truck	.05	"
ing utensils	.22	"
ing bottles	.35	"
labor	.05	"
bor	.08	"
al	1.32	"

The milk is cooled to below fifty ees, which stops most of the bac- l action. It is poured through n filters to take out all the dirt might happen to get in. All the sils that touch the milk are ed with brushes and steamed out aired in the sun to keep them t.

Then it costs 1.85c a quart to de- the milk to you. We do it with rd truck because we are quite a nce from town and our route is concentrated in as small a terri- as a city route is.

We haven't considered the operat- costs of all the buildings and pment yet. Here is the list which can see for yourself:"

	.12	cents
house	.03	"
	.03	"
use	.01	"
system	.14	"
s	.02	"
washer	.09	"
ator	.07	"
ier	.06	"
r	.01	"
ier	.02	"
al	.60	"

e also showed him this list of lental expenses:

	.35	cents
ng	.12	"
ance	.04	"
	.13	"
s	.15	"
	.14	"
al	.93	"

f you have kept track of all of e items, I think you will find they total to 13.13 cents a quart, as ws:

st	1.67	cents
	4.72	"
labor	1.60	"
g cows	.44	"
house	1.32	"
ry	1.85	"
ting	.60	"
ntal	.93	"
	13.13	"

That leaves only .87c profit," said ner. "Mr. Jones in town claimed ad to have seven cents a quart. at all the money you make?"

No. Because of my small herd, osts are extra high, but the cows largely pure-breds, so I realize a quart profit from my calves. And my manure is worth 66c a day in fertilizing value if I haul it out every day. That equals .60c a quart. These two items total 2.29c a quart, and make 'my net cost 10.84c a quart."

"That gives you a profit of 3.16c a quart," observed Mather.

"And makes a profit of $3.476 a day, or $1,268.64 a year, counting 365 days in the year. You see we deliver every day, as babies have to have their food. Sometimes we have to take a shovel along on the route in the winter to dig through the snow."

"Well, you are not making as much as I thought you were," admitted Mather.

"I am not doing as well as some farmers," Baker replied, "because I have been in the business only a few years, and haven't built up my route yet. Of course, it doesn't cost so much to live out here. I have a garden, and my home isn't as expensive."

"How is it that these other farmers charge less for their milk?" asked Mather.

"They don't take the care of their milk that we do, and can't get the price. Our milk will keep sweet several days, while some of the others have a hard time keeping theirs sweet for a day. Ours has the flavor that people like when they drink milk. Wouldn't you drink more milk if you could get this kind all the time?"

"I'll say I would."

"The other fellows could get a better price if they did what I do. There is no secret about our milk. But in towns of this size where several farmers have milk routes, the majority do not care enough about their milk to make it a quality product. I always figure that I deserve a little more profit for thinking about my work more, and producing a better product. In town the president of the bank gets more than the clerk for the same number of hours' work, because he thinks about his job."

"Well, what did you find out?" his mother asked Mather that evening at supper.

"I found out there is more to farming than I had supposed," Mather replied.

Seed Corn Situation

HOARD'S DAIRYMAN:—Never before in the history of our state has the condition looked so serious at the middle of August for seed corn production. The drought in some sections of the state, combined with the cool weather, seems to keep the corn almost at a standstill. It usually requires forty days from the time the corn silks before it is sufficiently hard to make good seed. Many fields of corn in the state at the present time have not reached the silking stage, so consequently unless we have practically the whole month of September and possibly a few days in October, we are going to face a seed corn shortage.

The members of the Wisconsin Experiment Association have done everything in their power to hasten the ripening of the corn crop by early planting, together with the use of fertilizers. They stand ready with the proper dry houses to cure the seed after it has been harvested so again they may save the day for Wisconsin in putting up sufficient corn to supply the farmers' needs.

It behooves every farmer, especially those who are growing standard varieties of corn, to select as much seed corn as possible. Often we have favorable spots in a field that will mature more rapidly than in other spots and every ear of ripened corn should be saved for seed. The Wisconsin Experiment Association will list all pure-bred seed that is put up by any farmers, providing they are willing to submit their corn for inspection. When these lists are sent far and near throughout the world, there will be little difficulty in disposing of their seed. We are urging the selection of seed corn at this time because we feel certain that there will be less seed corn grown in the state this year than any time during the past quarter of a century.

We hope that farmers will take this under consideration and select every ear of corn that properly matures and see that it is put in a dry place and cured for seed.

Wisconsin. R. A. MOORE.

Don't gamble with Your meat

TO some farmers meat curing is more or less of a gamble. Will it taste well? Will it keep? Will it be coated with salt? These are a few of the questions they ask.

There is no reason for this uncertainty — none whatever. Be sure the salt is right — and the cure will take care of itself.

Diamond Crystal Salt is the answer to all questions at curing time. It is pure and mild; that insures sweet, full-flavored meat. It penetrates the meat to the bone; that insures against spoilage. It dissolves quickly and works into the meat readily; that is an assurance against a salty coating. Use Diamond Crystal—you will see how well it works.

There is a Diamond Crystal Salt for every farm use—for curing meats, for livestock, for canning, for table and for cooking, for butter and cheese-making. Ask for Diamond Crystal at the store where you trade.

"The Salt that's all Salt."

Swine

Sources of Infection

Tuberculosis in Swine

Little attention was given to eradicating tuberculosis from hogs in this country until the losses from retained and condemned carcasses in packing plants became such as to necessitate an attempt to reduce the number of diseased animals. The extent to which the disease has progressed is shown by the inspection data on 4,000,906 hogs from the Middle West slaughtered in 1925. Of this number, 704,758 or 17.6 per cent were found to be tubercular.

In connection with the nation wide drive to eliminate tuberculosis from cattle it is important that swine producers become thoroughly familiar with the different ways whereby hogs become infected if the disease is to be effectively controlled.

That pigs are easily susceptible to contracting tuberculosis from being fed milk from diseased cows is shown by some data presented in Farmers' Bulletin No. 791, U. S. Dept. of Agriculture, by Mohler and Washburn. Hogs fed tuberculous milk for only 3 days and examined 107 days later showed that 83.3 per cent had become infected. When hogs were fed contaminated milk for 30 days and examined 50 days later, 100 per cent had developed generalized tuberculosis. Milk from diseased cows is therefore a source of great danger when fed to hogs. To avoid infection from this source all milk, skimmilk, buttermilk, and such like should be thoroughly pasteurized before it is fed unless it is positively known to have come from clean cows.

In a series of investigations by the Bureau of Animal Industry it was found that the feces of tuberculous cattle are often loaded with tuberculous germs. Hogs known to be free from tuberculosis were placed in isolated pens where a few shovelfuls of such feces were thrown daily while the hogs were fed other feed which was free from the disease germs. The result was the infection of 25 per cent of the first lot of hogs and 100 per cent of the second lot thus exposed. The tuberculous condition of the cattle voiding the feces was shown only by the tuberculin test, as they were apparently healthy, having no visible indications of the disease. Of a shipment of 34 hogs marketed 23 were found to be infected. On investigation it was found that the owner had a herd of dairy cows the manure from which was thrown into the hog yard. The hogs were given no milk nor were they permitted to mingle with the cattle. The tuberculin test was applied to the cows and 19 out of 27 reacted. On slaughter it was found that some of the cows were in advanced stages of the disease.

There are only two possible ways of preventing infection of swine from this source. Either the disease must be eliminated from the cattle, and this is the best way in the long run, or the manure from diseased herds must be kept away from hogs. This latter is an impractical thing to do on many farms.

In our June 25 issue we presented some data of investigations made to determine the extent of infected hogs with particular reference to the source,—tuberculous chickens. It has been shown that many of the retained carcasses in packing plants were infected by the avian tubercle bacillus. While the lesions of this source of infection are generally of a mild character compared to those resulting from bovine tubercle bacilli, nevertheless the persistent number of hogs showing infection has given no little concern among those charged with the eradication program including the interests of packers. A thorough clean-up among poultry flocks is necessary if hogs are to be made free from the disease.

One other source of infection on individual farms should be mentioned. The carcasses of dead animals are sometimes fed raw to hogs. Some farmers even remove dead animals from other farms and feed them to hogs. This is a bad practice so far as disease control is concerned.

A bad practice also prevails at some local slaughtering plants and rendering works. Frequently at such plants blood, intestines, viscera, and other inedible parts are fed to hogs. Where government inspection is in force this practice is not allowed.

A few farmers are under the impression that tankage is a source of infection to hogs. This can hardly be so in view of the facts governing the manufacture of this product.

A small amount of infection results from feeding uncooked garbage. The sources of the disease germs are mainly from tuberculous dairy products, sputum from tuberculous people, and the offal of tuberculous poultry.

So far as swine are concerned the first big job is to clean up our herds of cattle. This must be followed very closely, however, if not simultaneously with a thorough clean-up among poultry flocks. The sooner we realize this the more perfect will be the control of the disease among hogs.

Loading Hogs

Beating market hogs with heavy clubs is sometimes resorted to at loading time by those who have not tried a better way. The result is frequently reduced value in the carcasses of abused hogs when slaughtered. An obstinate hog will do a good job of getting by a cane, club, or the driver's legs but will stop short when confronted with a hurdle of light construction. Try a light hurdle in handling hogs.

"What makes the world go round and round, pop?"

"Oscar, how many times must I tell you to stay out of that cellar?'—Rutgers Chanticleer.

Poultry on the Dairy Farm

Dust Bath

How would sand do for hens to dust in in place of dust and ashes? Which would be best, fine or coarse sand?

Farragut, Iowa. J. E. C.

If one feels it is necessary to supply the hens with some sort of a dust bath, I imagine the concrete road idea has not been so universally accepted but that it would be possible to get out to some side road or some field and obtain enough good, dry dust in the fall of the year to be put in a box and used for that purpose. In lieu of the dust one could undoubtedly use the fine sand satisfactorily. It is rather a common belief, however, that the use of ashes should be rather discouraged, since it tends to oftentimes irritate and results in a soreness of the shanks of the bird's legs.

I rather believe, however, that this idea of the dust bath in the house is one of these prehistoric ideas that has been handed down from generation to generation and a practice that we still continue to adopt as we do happen to notice that when a hen does get out in the dirt some place she decides to wallow in it. If under the artificial conditions which we are following we do our share toward promoting proper sanitation in connection with the house and with the flock, which means particularly treating the roosts for mites and treating the birds at whatever intervals might be required for mites, they do not need any wallow of this sort. A hen can, undoubtedly, get as much pleasure out of stretching out in the sun in a good clean litter as she can in a dust box.

One will always find with proper conditions in a house that it is or should be dry and dusty, which means the litter as well as the house itself. Damp, wet, soggy litter is not necessary in a properly managed building. If one then adds to this a dust box and permits the hens to work in that and to play in it every time they are frightened, you are just going to aggravate that condition and keep the house most of the time looking like London on a foggy morning.

No well founded reason for using a dust bath has ever been advanced. One never finds them in a good commercial plant, and the ideas used in a commercial plant should be the ideas and the methods which we should attempt to develop and incorporate into the management of our own small farm flocks.

As indicated above, if you have to have something for the hens in order to make you feel better, it may be advisable to use sand, but if sand or road dust is used, I would not incorporate ashes.—J. B. HAYES.

A. A. BROWN, POULTRY SPECIALIST

Mr. Brown succeeds H. M. Lackie as poultry marketing specialist of the Wisconsin Department of Markets. Mr. Brown specialized in poultry while a student at the University of Wisconsin, taught poultry husbandry, and was a county agent for a number of years, and for the past three years has operated an accredited hatchery.

Attendance Record Broken

At the International Baby Chick Association Convention, at Grand Rapids, Mich., July 18 to 22, there were registered from 32 states and 3 foreign countries 1,223 people. It was estimated that from 300 to 400 people who were not registered but interested in poultry raising attended one or more of the sessions. The convention hall seated over 700 people and was filled all the time from the first to last session, and at the same time the exhibits and lobbies were crowded with hatcherymen.

20% more money for your butterfat *in California*

If you are selling your butterfat at average prices, the fact that California farmers are getting 20% more than you are will help you to see how easy it is for a good all 'round farmer to get along in California.

Because the California farmer can cut five or six crops of alfalfa from his land, and then leave another crop standing for green pasturage through the snowless winters—and because he can get cheap electricity everywhere for milking and sterilizing—and because his cows live longer in this gentle climate—the average production of butterfat per cow is the *highest* in the United States.

A small dairy herd will give you your quickest, surest start in California farming, with 20% higher cream checks coming in immediately. Fill out with hogs and poultry—we import dressed poultry from the middle west and raise only 25% of the pork we eat, although you can have green feed for all your stock the year round and raise two litters of pigs each year.

These illustrations are typical of farming opportunities in California's Great Valley and neighboring valleys for any capable farmer who has enough capital for a fair stake. Far north of San Francisco, where the frostless citrus belt runs, the earliest oranges ripen for Thanksgiving markets. The Great Valley's cotton yield per acre exceeds all other states with a 3 to 5 cent premium over national market levels on account of its quality. California fruits and vegetables, fresh, dried and canned, are staples throughout the world. Altogether, we raise 180 different kinds of crops commercially.

$700,000,000 worth of farm products are raised each year in the Golden State, and four-fifths of the total farming area is in the Great Valley, the lovely coastal valleys and the foothills, north, east and south of San Francisco Bay.

Soil, water and climate make these great crops possible—the same climate that you and your family will enjoy every month in the year. Come out and see a 500-mile-long sample of farm crops and farm life in California. See our vast mountains and seashore playgrounds, our roads and schools, the cities on San Francisco Bay where more than a million people live. Talk with farmers, and with the merchants and bankers in the Great Valley. Find out exactly what you can do with the capital you can bring.

Low summer round-trip fares to California —$90.30 from Chicago for example.

Californians Inc., was organized to help you in your search for a place in California, where life is better. It is composed of citizens and business institutions interested in the upbuilding of the state. It has nothing to sell you, but much valuable assistance to give. VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Summer Sore Mouth

Nearly every summer and autumn we receive complaints of a mysterious disease of the mouth, and sometimes of the feet, of grazing cattle. In some instances owners have shown great alarm as the symptoms indicating the disease in question are somewhat similar to those of contagious foot and mouth disease and we have even known of that disease being reported as present and the government officials being appealed to for aid. It is highly important, therefore, that every veterinarian and all cattlemen should know the real character of the disease and be able to differentiate it from the contagious disease. The summer disease we have referred to here is mycotic stomatitis.

That disease is not contagious and not infectious. It is caused by acrid fungi in pasture grasses. The exact fungus or mold responsible for the attacks has not, so far as we are aware, been definitely determined. The red and black molds of the clovers may be to blame, or it may be a mold peculiar to the grasses. Anyhow, the disease appears when the weather has been damp, hot, and muggy, favoring the development of fungi and no other cause has thus far been found for the malady. It occurs sporadically, meaning that animals are attacked in widely distant places and few in one herd are affected. It does not spread from animal to animal, neither does it affect farm animals other than cattle, young and old. Contagious foot and mouth disease, on the contrary, quickly becomes widespread in entire counties and states and attacks all cloven-footed animals.

Mycotic stomatitis causes formation of sores and ulcers upon the muzzle and on the lining membrane of the month. Ulcers having red, inflamed margins and depressed centers filled with yellow or greenish pus and foul smelling decomposing tissues are seen on the lips, tongue, dental pad and cheeks, or one or other of those parts. They may also occur upon the skin about the hoof-heads or that between the toes. When foot lesions occur the animal is lame and stiff and the leg is swollen sometimes as high as the fetlock joint. Vesicles filled with lymph do not characterize this disease. They are characteristic of contagious foot and mouth disease. The mycotic disease runs a course of about two weeks, rarely kills an animal, and is readily remedied by treatment. It causes loss of appetite, suppression of cud-chewing, emaciation, and shrink in milk and therefore is a serious cause of loss. Fortunately, it is not very common and as few animals at one time are affected it need not cause great alarm.

Treatment consists in keeping the cattle off the pasture in which the cases occurred and feeding affected animals soft, readily masticated and digested feed, such as mashes of bran, oil meal, and ground grains, cut grass, and, in severe cases, providing hay tea, flaxseed tea, skimmilk, and water instead of solid feed. The sores should be cleansed and well swabbed with a freshly made 2 per cent solution of mercurochrome or with tincture of iodine. Afterward swabbing with a 1 per cent solution of potassium permanganate or strong solution of borax and alum should be done once or twice daily. Sores on the feet may be similarly treated with mercurochrome or iodine and then be kept covered with oxide of zinc ointment. The veterinarian will prescribe any additional treatment necessary in cases that prove obstinate.

Mastitis

I have a cow that has udder trouble. The udder is inflamed and has a hard knot in it that I call a hard cake. This trouble started in one quarter and went all around. Now all four quarters are affected. A yellow fluid comes out instead of milk. Two years ago she was affected in one quarter but it did not affect the other three quarters.

Hazel Green, Ala. R. C. R.

There is no certain remedy for chronic or established mastitis (garget) which is germ-caused and contagious. The disease eventually ruins the affected quarters for normal milk production. The important matter, in such a case as you describe, is to isolate the cow, catch the abnormal milk in a vessel containing a disinfecting solution and then throw it out in a place from which cows are excluded. The infection may be carried from cow to cow by the milker's hands or cups of the milking machine or be contracted by the teats coming in contact with a floor or ground on which fluid from a diseased udder has been allowed to fall. Cleanse, disinfect, and whitewash the stall in which the affected cow has stood and include the floor and gutter. Have your veterinarian give the suspected cows preventive hypodermic treatment with a biologic antagonistic to the disease. Such treatment with anti-mastitis serum at the start of an attack may also prove remedial.

Goiter

Please inform me in regard to a swelling on the neck of my young heifer calf which was there at birth. It is back of the chops on the larynx, not very large, and does not seem at all painful. Can it be goiter?

Mission Hill, S. D. G. L. G.

The enlargement constitutes goiter to which the tendency is hereditary. It may be prevented by giving each pregnant cow two grains of potassium iodide once daily in water throughout pregnancy and feeding a complete ration and minerals. Treat the enlargement by clipping off the hair and applying tincture of iodine two or three times a week. Also give the calf two grains of potassium iodide daily in water.

Use the sprinkling can FREELY

Destroys disease germs—keeps down foul odors

DR. HESS Dip and Disinfectant quickly establishes health conditions and helps to prevent contagious diseases.

Dip, spray or sprinkle and give every animal a chance to be at its best and to do its best.

This standardized preparation has five times the strength of carbolic acid. Always uniform in strength. It makes the finest, milk-white emulsion of any dip you can buy at any price.

Dr. Hess Dip and Disinfectant kills hog lice, sheep ticks, scab.

Kills poultry lice and mites. Destroys disease germs and makes dairy barns sanitary and clean smelling.

Dr. Hess Dip and Disinfectant costs less than ordinary dips because it goes farther.

Excellent household disinfectant.

Pipe Smoker Finds Price Does Not Determine Tobacco Satisfaction

Starting with expensive tobaccos h finally came down to one that is now his favorite

Apparently in selecting a certain to bacco, smokers suspend the rule: 'Th more you pay, the better you'll lik it."

After all, satisfaction is a matte of taste, not of price. For that reaso the quality and flavor of Edgewort have never been changed. If you lik Edgeworth today you will like it te years from today—unless your tast changes.

Here is an interesting letter from young man who shows signs of be coming a life member of the Edge worth Club:

Chicago, Ill.
February 17, 1927

Larus & Bro. Co.
Richmond, Va.

Gentlemen:

I'm just a young man—less than thirty. About five years ago I switched from cigarettes to a pipe. Why? Because I found that a pipe required the least attention and also interrupted me in my work the least.

At first I only smoked the more expensive brands of tobacco. Then I tried the less expensive blends. I guess I tried them all. Finally I tried Edgeworth. I liked it at the start—and repeated, and repeated.

For the last four years I have smoked nothing but Edgeworth—except when I was unable to obtain it. And, whenever I couldn't get it and had to substitute, I was glad to return to Edgeworth as soon as possible. Now I smoke about two cans of Edgeworth every four days.

No other tobacco can take the place of Edgeworth in my pipe.

Sincerely,
Paul A. Johnston

To those who hav never tried Edge worth we make thi offer:

Let us send yo free samples o Edgeworth so tha you may put it t the pipe test. I you like the sam ples, you'll lik Edgewort wherever an whenever yo buy it, for it nev er changes in quality.

Write your name and address t Larus & Brother Company, 15 S. 21s Street, Richmond, Va.

We'll be grateful for the name an address of your tobacco dealer, too, i you care to add them.

Edgeworth is sold in various size to suit the needs and means of al purchasers. Both Edgeworth Plug Slice and Edgeworth Ready-Rubbe are packed in small, pocket-size pack ages, in handsome humidors holding pound, and also in several handy in between sizes.

To Retail Tobacco Merchants: I your jobber cannot supply you wit Edgeworth, Larus & Brother Com pany will gladly send you prepaid b parcel post a one- or two-dozen carto of any size of Edgeworth Plug Sli or Edgeworth Ready-Rubbed for th same price you would pay the jobber

On your radio—tune in on WRVA, Richmond Va.—the Edgeworth Station. Wave length 1180 kilocycles.

Ice Cream Production in 1926

The total production of ice cream in the United States increased slightly during the year 1926 over that of 1925. Owing to the cooler weather in 1926, the increase was only 0.6 of one per cent, or 1,936,000 gallons. In 1926 the weather for the United States as a whole was reported cooler than in 1925 for six months, warmer for four months, and about the same for two months.

The total production of ice cream for 1926, including that made in homes, drug stores, and other places, was estimated at 324,665,000 gallons which made the per capita consumption for 1926, 2.77 gallons as compared with 3.80 gallons in 1925. The per capita consumption was lower in 1926 than in 1925 because the percentage increase in population was greater than the increased production of ice cream.

The production of ice cream has been increasing in the last few years as no other product of the dairy industry. In 1910 the production was estimated at 95,450,000 gallons. By 1920 it had increased 172 per cent, totaling 260,000,000 gallons, while in 1926 it had increased over 1920 by about 25 per cent and totalled 324,365,000 gallons. The production of ice cream increased in 16 years more than 240 per cent.

Uncle Ab says that he does not live for work nor for play, but for enough of both. One way he gets both is to work at tasks he enjoys.

JERSEYS FOR SALE

YOUNG BULLS and BRED HEIFERS sired by Image's Owl, grandson of Vive La France. Herd Federal Accredited.

H. S. HAGER, PRAIRIE DU SAC, WIS.

JERSEY BULL

Dropped Feb. 18, 1927, solid color, well grown, good type. Sired by University Pogis Kenna, whose dam is a gold medal cow. Price $100. Send for pedigree. U. S. accredited herd. No abortion.

AMBERG FARM, HILLSBORO, WIS.

Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.

THE GOLDEN GLOW JERSEY FARM KENSINGTON, MD.

The Shortest Road to Profitable Dairying

Good, pure-bred Jersey bulls give their daughters desirable type and the ability to produce economically and profitably. They provide the shortest road to success in dairying.

We will be glad to assist you in locating good Jersey sires. Send for free booklets on Jerseys and profitable dairying.

HOLSTEINS

AN AREA TESTED COUNTY

The breeding of pure-bred Holsteins has been in progress for over fifty years. The breeders are now in a position to sell some of their best animals at reasonable prices. Waukesha County has more Dollars invested in better bred cattle than any other county in the world. Summer buyers are given every consideration in helping to locate and assemble their purchases, whether it be one or a carload. Can furnish you right now with

30 pure-bred heifers bred to freshen this fall.
A carload of bred, richly bred, grade heifers.
4 carloads of springing and fresh, highly bred grade cows, August and September freshening.
Also have a number of good pure-bred bulls from 3 months to 1½ years old.

Send for bull list or write your wants. Example: Bull born Nov. 15, 1925. Excellent individual, mostly white in color. Sire—King Pontiac Fayne Butter Boy, whose dam is a 30-lb. cow. Dam is Wisconsin Piebe Oak De Kol Watson, a show cow that has a record of 20 lbs. of butter in 7 days as a 3-yr.-old. Price $175.

Use A Son of Matador 6th

A Show Bull That Transmits Show Type

STUDY the photograph of Matador 6th above. Ten years ago as a calf he was good enough to be made Jr. champion at the National Dairy Show. As a 3-year-old, he was considered one of the greatest show bulls in America, and from then on for four years he was made grand-Champion at the Pacific International. In recent years he has been exhibited in all parts of America and although showing his age, he has never failed to place high in any show ring where he has appeared.

Not until his four sisters had performed so remarkably at the pail, however, was he selected by Carnation Farms as a herd sire, and now his daughters are coming on and making records of 23 pounds of butter in 7 days as 2-year-olds.

Study the photograph of his offspring recently sold to a breeder in Colorado, then write for information about one of his sons for a herd sire in your herd.

Complete Dispersal of the Famous

HOLLYHOCK HERD

GUSTAVE PABST, Owner *A Clean Herd* **F. J. SOUTHCOTT, Manager**

The Hollyhock herd is one of the great herds of all time. For big, high producing Holsteins of show type, the herd is a masterpiece of breeding art. It has been founded on ORMSBY, BESS BURKE and FOBES bloodlines and in no other herd can there be found such an abundance of SIR P. O. M. 37TH blood. In no other herd of like size can there be found as many 1000-lb. butter producers. The sale is an opportunity that no progressive dairyman should miss.

HOLLYHOCK CANARY FOBES 755188
A 31.94-lb. 5-year-old daughter of Sir Bess Ormsby Fobes (center above) and going strong on year test. Made 24 as a 2-year-old with 779 lbs. for the year. From an 845-lb. 2-yr.-old daughter of an 1118-lb. cow.

More High Yearly Record Cows and Heifers Than Have Ever Before Been Offered in a Public Sale

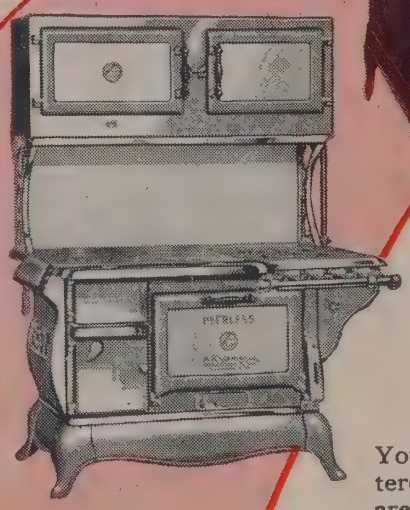
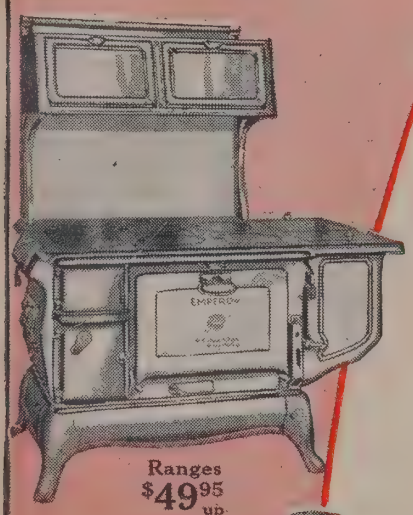
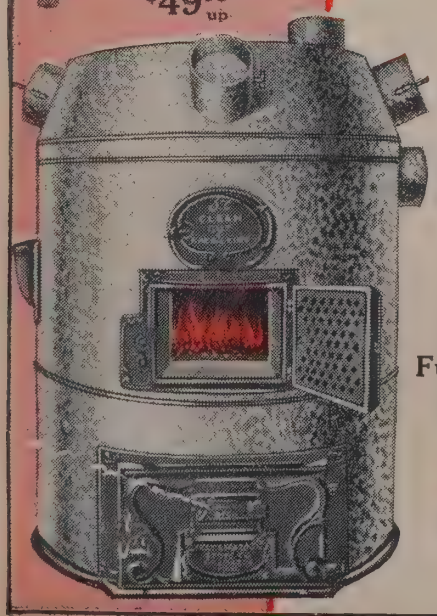
650,000 Satisfied Customers



Have Saved ⅓ to ½ by buying Direct from Kalamazoo





Reduced Factory Prices

Five Year Guarantee of Quality

650,000 customers — one out of every 35 families in the United States. They are not only Kalamazoo customers — they are *satisfied Kalamazoo customers*. That's the important thing — *satisfied customers*. And think of this: they are increasing at the tremendous rate of more than 50,000 *new* customers a year. Could anything more clearly or concisely prove Kalamazoo quality! Could anything more convincingly or conclusively prove that Kalamazoo is saving customers ⅓ to ½ by selling direct from factory to user.

Get Your Copy of this New FREE Book

Your FREE book is ready — alive with interest, full of new features. Reduced prices are in effect! A new 5-year quality guarantee is in force! See the Beautiful Porcelain Enamel Ranges in beautiful delft blue and pearl gray — the very latest and most popular of all ranges. Look for the Mahogany Porcelain Enamel Heating Stoves — the most popular of all heating stoves. Read about the new Hot Blast, improved fire box — more heat from less fuel, a clean fire without smoke or soot. See the latest improvements in warm air furnaces —pipe and pipeless.

200 Styles and Sizes

No matter what you are interested in — gas stoves, coal and wood ranges, combination gas and coal ranges, oil stoves, heating stoves or furnaces (pipe or one-register type) — you will find here exactly what you want. Mail coupon today.

Quality First — Values Unexcelled

Kalamazoo values cannot be equalled anywhere. When you buy from Kalamazoo you buy direct from manufacturer. There is nothing between you and our factory —but the railroad tracks. We are not a mail order house that collects a variety of merchandise from scores of factories to sell by mail — we are *specialized* manufacturers, making Kalamazoo stoves, ranges and furnaces complete in our own highly modernized factory and shipping direct to you, thus eliminating any other manufacturer or middleman of any kind. We build in large quantities. You get better quality at lower prices from a factory whose sole interest is making stoves, ranges and furnaces than elsewhere. This new catalog proves it. Fill out coupon for your copy.

30 Days FREE Trial

Send for this new book *now*. Learn how Kalamazoo gives you 30 days FREE trial in your own home and 360 days approval test on anything you purchase. Read how Kalamazoo is saving over $1,000,000 yearly for Kalamazoo customers.

24-Hour Service — Safe Delivery Guaranteed

Send for this book! See how close Kalamazoo is to you—24 hour shipping service saves you time. Kalamazoo goods are carefully packed to arrive safely. Safe delivery is absolutely guaranteed.

Cash or Easy Terms

This FREE book quotes you easy terms that are truly amazing — many as low as $3 down and $3 monthly. Nowhere in the world can you get such value, such service as Kalamazoo now offers. This new book shows you why this big 13-acre factory, now in its 26th year, is a national institution.

Free Furnace Plans

This new FREE book tells you how you make a double saving on Kalamazoo furnaces. First it saves you ⅓ to ½ on the price of the furnace itself. Secondly, it illustrates how you save the cost of installation by following Kalamazoo FREE plans and FREE service. Thousands of Kalamazoo owners have put up their furnaces themselves.

Beautiful Porcelain Enamel Ranges

Everywhere now porcelain enamel ranges are in demand. See these Kalamazoo ranges in delft blue and pearl gray—bright, colorful, glistening clean—as easy to clean as a china dish. *Check and Mail Coupon Today!*

The Guide To Good Tractor Lubrication

If you want full time work out of your tractor—at the least possible expense—follow this chart. It tells you exactly what grade of Polarine *your* tractor requires.

The Standard Oil Company (Indiana) has manufactured a grade of Polarine for each type of engine.

Polarine lubricates every part of the engine—cushions it with oil—protects it from friction. A tractor lubricated with Polarine will last long and wear well. Day after day always ready, never sick, never tired—a machine you can depend upon to get your work done when you want it done! Working away, week in and week out, with steady strength and powerful pull!

Polarine is the faithful "standby" of many thousands of farmers in the Middle West. They have found that it gives maximum lubrication at minimum cost.

Polarine Special Heavy is recommended for Fordsons

Follow-up Dairy Tour in San Luis Valley

The San Luis Valley Dairy Associa-on, Colorado, and its good work for e past three years is now well own. M. C. Long, in charge of the tension work of the Holstein-Frie-an Association in 1923, co-operating th State Dairy Commissioner eorge E. Morton of Colorado, Dave . Thomas, Director of Development ork of Denver Chamber of Com-erce and the Agricultural Depart-ent of the Denver & Rio Grande estern Railroad Company, with lley community leaders, brought is dairy association into being. It erates over five big counties, mak-g an area greater than at least the ree New England States of New mpshire, Connecticut, and Rhode and.

The Dairy Sires Committee ran a iry sires special over the Valley in spring of 1925, distributing eleven re-bred bulls in as many dairy com-nities within this great mountain lley. The bulls were traded even for scrub sires that were, at that ne, in service. These scrubs went greasers to the vat.

In 1926 and now in 1927, a follow--campaign or tour was made to the ms where these bulls were placed, study the herd, the farm conven-ces for dairying, and get of sire. Max Grandy, field agent who di-ted these tours, reports since the re-Bred Dairy Sires Committee ced these eleven pure-bred bulls in 25, 96 registered bulls and 2,000 ter producing cows have been ught in.

The dairy population in this Valley now 5,000 and before the associa-n reaches its fifth year, it is hoped Valley should have 10,000 cows h a performance record of 250 lbs. average for the whole Valley.

Colorado. W. H. OLIN.

Rat Killing

HOARD'S DAIRYMAN:—When I was oy somebody put me into the no-n of keeping a count of the rats I led throughout the year. The boy s in the very early teen age, but habit of killing rats has never n discontinued. That year the mber of rats killed from January 1 the last day of December was 79.

still enjoy a rat hunt. I enjoy gging" a sly and stubborn old lent just as much as a fisherman oys pulling out elusive trout or a ter enjoys the chase. Rats have a utation for being very smart, but y are never smart enough to out-a man or even a boy if the man or is warm and industrious after t rodent.

Rats are very careless about run-g over old bags or meal, so about one has to do is to set a jaw-trap ler the old bags or in the meal. In owning rats with water most work-go about it the wrong way. The n shown in the accompanying il-tration has poured plenty of wat-in the hole and has inserted a omstick so he can pull it quickly to

WHEN DROWNING RATS USE A BROOMSTICK

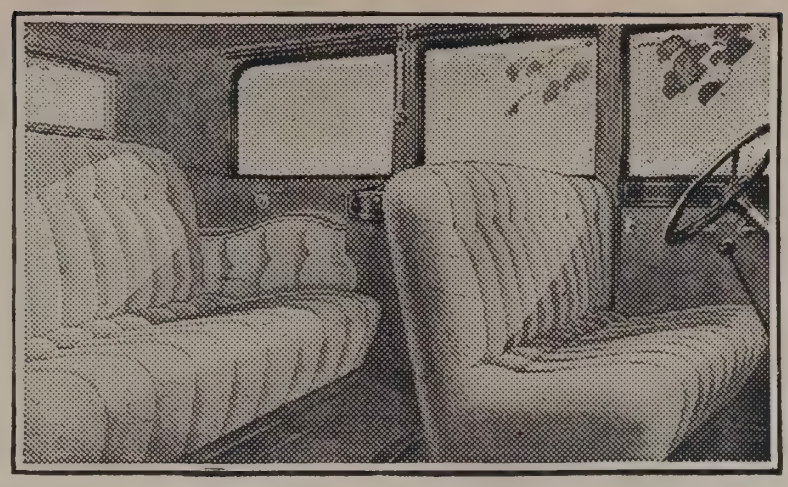
right or left as the rat crowds by. The rat never gets out for a chase, as is usually the case when rats are drowned out the wrong way.

Throw an old cloth down where the rats run, then in a few days after they have got used to running over the cloth set the trap under it and a rat is sure to be caught sooner or later. If you want to trap the rats keep them from a feed supply—don't leave out too much chicken feed or spill corn around the barn. Corn is an excellent rat bait if it can be made scarce. I prefer it to cheese, for cheese can easily make the rat wary and suspicious.

The best way to kill rats is not to talk at length with the neighbors about age-old ways of killing rats but just go out where the rats are and go to thinking and planning and you will catch rats much faster than by following old cheese-bait methods.

Ohio. G. P. WILLIAMS.

Samantha says: A boy too good to get into mischief is likely to grow up into a man good for nothing.



Disposing of Boarder Cows

In talking with a cow tester in Adams County, Indiana, last summer, the question of disposing of boarder cows came up. This tester made the remark that he found it harder to persuade owners of pure-bred boarders to dispose of them than the owners of grades that have not come up to the mark of profitable producers.

Just why anyone wants to keep a pure-bred registered cow that has been tested and found wanting we do not know. If such a cow can't pay her board out of the milk check it must be her owner expects to sell her recorded offspring at a price sufficient to make up the deficit.

Selling the milk from such a cow is fair enough to the man who buys it because he gets what he pays for. It is an honest transaction.

After a man knows a certain pure-bred recorded cow in his herd is a boarder and then continues to pass off her recorded offspring to unsuspecting buyers he betrays a confidence that the public has a right to expect in registered cattle.

The One-Room Home Of Every Closed Car Owner

A closed car is virtually a one-room home—a home in which the average motorist spends more waking hours than in any room in his house. When the body is by Fisher, your one-room house on wheels is sure to possess not only many outstanding advantages in comfort, in convenience, and in beauty, but also an extreme degree of durability which assures that the interior of your Fisher Body, including the upholstery, will retain its charm of appearance during the long life of the car. When you select a new car be sure that it brings you the important superiorities which Fisher Bodies provide.

Interior Features of Body by Fisher

Upholstery Cloth—Fisher uses mohair, velour and broadcloth, carefully tested for long wear and color fastness, of pleasing and harmonious color design and pattern.

Cushions and Backs—Fisher designs seat cushions and backs with utmost attention to comfort and durability. Saddle-back type springs are used in order to fit the contours of the human body and thus provide the maximum in riding comfort. Seat cushions and the back cushions each contain 50 flexible, resilient springs.

Hardware—Fisher door handles, window regulator handles, dome lights, and other appointments are all of pleasing design, and lasting finish, constructed for long service.

BEAUTY that surpasses all tradition

Buick for 1928 is *Beauty for 1928* —a de luxe presentation of new motor car styles by the world's foremost designers. Here is what Fashion decrees:

Graceful Bodies by Fisher, swung smartly low, without any loss of head-room or road-clearance and without resorting to smaller wheels . . . plus color harmonies, *inside and out,* endowing closed car interiors with the beauty of exquisite drawing-rooms — and crowning all, a refreshing air of youthfulness.

Even brief inspection of the Buick line assures you there is no longer any need to delay purchase of your new car. Buick for 1928 is Beauty for 1928 — and performance, luxury and value for 1928 as well.

OUR RURAL SCHOOLS

ALBERT S. EYLAR, NEW MEXICO

HE picture of a Michigan farm boy appeared some time ago in one of the descriptions of successful farms that Hoard's Dairyman s been publishing. After giving e boy due credit for the part he d played in putting that farm over e top, the article spoke of the in- rest this boy had in his father's rm as something remarkle in these days when the ll of the city is so strong. Gilbert Haugen is an Iowa rmer who has represented s district in Congress for ore than a quarter of a ntury. He is chairman of e Congressional Agricul- al Committee, and on his enty-fifth congressional niversary some of his Iowa ends presented him with a ver gavel. An Iowa lady de the presentation eech, during which she k occasion to say:

'Mr. Haugen and all the t of this committee know t the farmers' backs are ding under taxes. A large m of this is for our coun- school teachers. Who are teachers who 'hand it wn' to the country boys l girls? Mostly small rn girls who make $200 a r more than they could at ne. From them the coun- children get a distorted a of the advantages of m with a notion that in Street must be a heavy place and decide then l there they are not going stay on the farm. Your mittee should demand t our agricultural colleges l experiment stations in teachers enough to take e of the country schools."

Undoubtedly Iowa has nurous rural schools that giving to the teaching of iculture all the considera- that the subject deves, along with many oth- of the type that the Iowa y described. Nor should be imagined that Iowa nds alone in this respect. survey of Maryland ru- schools was made a few rs ago by two educational erts employed by the te. One of the main ques- s before these experts was to ascer- if the courses of study in these rural schools contained anything specialalculated to make the children betfitted for country life. They had nswer this question in the negai. They found almost everything he rural school that would assist children to take up some profesor follow a life of cultured ease, little, if anything, designed to er equip them to meet the probs of rural life. The courses of ly were copied largely from those of the cities and the country children were receiving a cityfied education that closed their eyes to the opportunities of country life. They concluded that if the country boys and girls of Maryland didn't become city job hunters, you couldn't blame the rural schools, for that appeared to be what the system wanted to make out of them. Worthy exceptions to the rule were discovered, but the experts found that these exceptions existed not as a product of the system but in spite of it.

And now for the best part of the Maryland story. Recently I attended an afternoon session of a teachers' convention and heard one of the leaders of the meeting, a distinguished educator from one of our universities, make the statement that today Maryland has the best system of rural schools in the United States. Such a reputation means much to Maryland. It means a coming generation with a greater pride in rural life, men and women better qualified to co-operate and get a larger share of the consumer's dollar because of the schooling they have received.

No person ever had a more profound conviction that the chief aim of education should be to show the children how to work instead of how to live without work, than the great negro teacher, Booker Washington. Before founding Tuskegee Institute in Alabama, he traveled for weeks over that state, eating and sleeping with the colored folks in their cabins, that he might have first hand the facts upon which to establish a school that would meet their needs. It was a wilderness where he founded Tuskegee and the land had to be cleared. When the boys came to him to go to school, Booker asked them to help him clear the land. At first the most of them said, "No, sah, I nevah come hy'ah to wuk. I comes to study Latin." But Booker would put on overalls, grab a grubbing hoe, and tell them to come on. So firmly did he plant in his students the idea that the chief aim of his education would be to show them how to work, that they not only cleared the land, but all the buildings on the ground they erected with their own hands. "We shall prosper," he said, "in proportion as we dignify and glory labor and put skill and intelligence in the common occupations of life."

Information on this subject is plentiful. Our national department of education issues bulletins as profusely as our own department of agriculture, and for years its bulletins containing model courses of study for rural schools have been available for the asking. Why do these model courses have such a hard time getting started? It is evident no teacher like the one described by the Iowa lady could handle the agricultural studies prescribed by these model courses, particularly in the higher grades. But do the farmers want such teachers? Not all the farmers. Nor is it wholly a matter of cost, for the farmer knows a poor school is just as unprofitable an investment as a poor cow. There are other reasons besides the question of cost.

A standard work on rural schools, now in its second edition, contains a statement to the effect that nearly all country children will remain on the farm except the few of them that nature has designed for higher spheres of usefulness in the city. These exceptional children should be taken care of, but their wants should not be allowed to dominate the course of study. But how many of these exceptional children are there? Are they in a majority? Probably so, in some rural communities, if the question was left to the parents. The error of the professor who wrote that excellent treatise on rural schools is very common, that the doctor, or the lawyer, or the minister fills a sphere of higher influence than the farmer. I submit that the pictures of the successful farmers and their families that occasionally appear in Hoard's Dairyman in connection with the de-

WHAT WOULD YOU DO?

"Don't Wear Hayseeds in Your Hair"

GUY A. PETERSON, WISCONSIN

BEAUTIFUL HOME AMONG THE PALMS OF SAN DIEGO WHERE DEAN HENRY NOW LIVES WITH HIS SISTER, LYDA

THE title of this article may sound queer for a story in a dairy paper, but it was the advice that the late Hiram Smith, dairyman and one time regent of the University of Wisconsin, gave to W. A. Henry two days before he came to the Wisconsin College of Agriculture to take up his duties as botanist in that new school which could not yet boast of a single agricultural student.

Dean Henry, who is now living with his sister in a beautiful palm-shaded home in San Diego, California, told us the story of this advice when we were guests at his home last December. To tell it in his own words: "Shortly after my appointment I got a letter from Hiram Smith asking me to come out to his farm before I went to Madison. At first I didn't know whether to go or not but since it would be only a little out of the way I decided to accept his invitation. I have never been sorry that I did so because Smith gave me some sound advice that I have never forgotten. He put his hand on my shoulder and said, 'Don't wear hayseeds in your hair, Henry. Teach the farmer to be a gentleman.' In all my years at the college I tried to keep that counsel in mind, because I believed then and I believe still that the thing that the farmer needs most is the ability to appreciate his occupation and the inclination to work together with his fellowmen."

Praises Danish Farmer

Henry's dreams of co-operation among farmers will probably not be realized in his day because he is now nearing his 77th birthday but he still has faith in the ultimate future of agriculture. He told us about a visit to Denmark and of how much he had been impressed by the co-operative activities of the Danish farmers, but the thing about the Dane that struck him most forcefully was the pride he took in his work and the way he would look him in the eye as much as to say, "I'm as good as the rest of you." To be a farmer and land owner in that country does not lower a man in his own estimation, for Henry has noticed, and so have we, that when you ask a Danish "landsman" what his occupation might be, he will answer with a touch of pride, "I'm a farmer," not "I'm nothing but a farmer," as we have had so many men tell us in the United States.

When we attended a farmers' co-operative meeting in Copenhagen a few years ago, we could not help but notice that these clean-shaven, well-dressed men carried their heads as though they could hold their own with any group of men anywhere. Co-operation and education have broken the Danish farmer's inferiority complex. If they can do that for the American farmer they will be worth any cost. We believe that they can, too, because one of the most noticeable things about an

FIVE MEN WHO HAVE HELPED MAKE THE UNIVERSITY OF WISCONSIN FAMOUS

Former Presidents Charles Van Hise and T. C. Chamberlain; Dean H. L. Russell; former Dean W. A. Henry; and Doctor Stephen Moulton Babcock.

The names of these five agricultural benefactors will long be remembered. Van Hise blazed the trail for conservation of our national resources; Chamberlain's works on geology and the naming of the glacial drift areas mark him as one of the nation's outstanding men in geology; Russell's experiments in agricultural bacteriology have proven to be an untold blessing to the dairymen of the United States; Henry's researches in Feeds and Feeding have been the basis of thousands of later feeding trials; and Babcock's test has encircled the globe for its simplicity as a measure of the fat content of dairy products.

DEAN HENRY TAKING A STROLL ALONG THE LILY POOL IN BALBOA PARK

American rural community wh farmers have really succeeded in p ting across a successful co-operat enterprise is the change that ta place in the farmers themselves.

What Will You Give Me?

Some say that the farmer sells wholesale and buys at retail, Henry put it in an even more for ful manner when he told us, "" American farmer as a class is only group in the United States t brings his goods on the market says, 'What will you give me?' " believes that the fundamental rea for this is the absence of pride in occupation.

Of course Henry recognizes t there are hundreds and even th sands of farmers who till the soil cause they love to do so, and take pride in producing qua products and building beaut homes, but he is honest eno to point out that there are too many men who are on the f merely because they were b there or because they don't know to do anything else. However spite of the large number of farn who work 16 hours a day from t necks down while their heads are ing as just so much dead weight spite of the many cow milkers feed poor cows timothy hay and v der why they don't prosper; an spite of the thousands of farr who sign co-operative contracts do not live up to their agreeme Henry still has hopes that the Am can farmer will eventually find k self and will value himself at his

Milk and Coffee Drinking Survey

THERE is a definite relationship between the class room standing and coffee drinking among school children according to results of a survey of more than 80,000 school children in Pittsburgh and Alleghany County just published by the Mellon Institute of Industrial Research, University of Pittsburgh, in co-operation with the Pittsburgh branch of the National Dairy Council.

The novel feature of the survey was the investigation on a broad scale of the relationship between the beverage habits of the children and the character of their school work. It was discovered that there is apparently a very definite connection between coffee or milk drinking and scholarship. The teachers were instructed to classify their pupils as "good" if they had a class standing of 85—100 per cent, as "fair" if their class standing was 75—85 per cent, and as "poor" if their class standing fell below 75 per cent. On this basis of comparison it was found that of all children surveyed there were more "good" pupils among those who drank only milk than "fair" or "poor" pupils; while, on the other hand, there were more "fair" than "good" or "poor" pupils among those who drank coffee exclusively or among those who drank both or neither, the one exception of this last statement being the city parochial school children, among whom there was a slightly greater number of "good" than "fair" or "poor" pupils in the subgroups consisting of those who drank both beverages or neither.

The primary objectives of the survey were to determine, first, how much milk and coffee the children drank at home and at what meals the beverages were had, and, secondly, to discover what influence either beverage, or both, may have upon the quality of the children's school work. This information, along with additional particulars such as age and race, was obtained by the teachers in the different schools by directly questioning the children. The children were asked about milk and coffee drunk only on the preceding day and were instructed to disregard milk taken between meals or at school and milk taken on fruit and cereals at meal time. It was considered that limiting the questioning to the previous day's experience of the children would result in more reliable answers than would asking for the average daily beverage habits of the children.

Analysis of the returns showed that the average city public school child drank 1.47 glasses of milk and 0.81 cup of coffee, the average city parochial school child 0.93 glass of milk and 1.52 cups of coffee, the average county public school child 1.58 glasses of milk and 0.72 cup of coffee, and the average county parochial school child 0.89 glass of milk and 1.37 cups of coffee. These figures apply only to the elementary grades and do not include kindergarten and high school grades.

As the dietary of children tends to conform more closely to that of adults as the children grow older, it was not at all surprising to find that in general they drank more coffee and less milk as their age advanced. Exceptions to this rule were discovered in the case of the city and county public school children where increased milk consumption was found during the first two or three years in school. Coffee consumption, moreover, decreased during this period in the instance of the city public school children. These favorable effects seem to indicate that child welfare work in the schools is not without influence, and is a very good illustration of the fact that the saturation point for milk consumption by children has not yet been reached. A general average of about 1.5 glasses of milk daily, or an average of 2.13 glasses which children in the better districts of the city drank, could obviously be increased to the benefit of the health and growth of the children.

One of the novel features of the investigation was a study of the distribution of milk and coffee drinking according to meals. It was found that of all grades and groups a larger proportion of the children who d only milk had it for lunch than h for breakfast or supper, and of t who drank only coffee nearly twic many had it for breakfast as h for the other meals. A relati small proportion of the children o groups drank neither milk nor c during the day, and only a compr tively few of them drank both and coffee at the same time. That dren have a tendency to drink mil clusive of coffee, or vice versa, ha so been noted by nutrition specia Except in the case of the county chial group, there were more chil who drank neither coffee nor mil the evening meal than children drank neither beverage at the two meals.

Comparison of the milk and c habits of children living in som the better sections of the city those of children from the slums industrial sections where the labo and foreign elements predom showed that the first named g drank 2.13 glasses of milk and 0.31 cup of coffee, as contrasted an average of 1.19 glasses of milk 1.10 cups of coffee consumed by second group—results which m well be anticipated. Somewhat le be expected, however, was the that the children in both groups tributed milk and coffee drin

TEN YEARS WITH DAIRY COWS

Dairyman Paid Mortgage in Ten Years

T is necessary at the beginning of this story to tell briefly what Mr. and Mrs. F. C. Guildner of Da-a County, Minnesota, have done in years in order that the reader be used to finish the story to find out v these things have been accom-shed.

n March, 1916, scarcely before ink on their marriage certificate ame dry, Mr. and Mrs. Guildner d $2,500 down on a 72½-acre m. They agreed to pay $100 an e for the farm. They had a little h left with which to buy horses. ey bought sparingly of machinery ause all they had to spend for this credit. Some farmers are ex-vagant with credit at times and 6 marked the beginning of what now known as a very extreme se of credit. Mr. and Mrs. Guild-elected, perhaps by necessity, to ke the best use of what they had work with.

At that time there was no silo, no cken house, no hay barn, and no dmill on the farm; and the soil not as productive as it is now. s left a house and barn for ch there was much to be desired. oday, Mr. and Mrs. ildner have five healthy, py children. They have d off the mortgage on the ½-acre farm, bought 40 es additional for $5,000, paid $1,000 already on . They have added a silo, hicken house, a hay barn, windmill, and a garage. ides this they have im-ved the house and barn, built a machine shed 60'. They have adequate chinery to operate the m. They own 4 horses, 20 le, 57 hogs, and 500 kens besides a nice flock turkeys. Their cows av-ged 498.6 lbs. butterfat in 5, and 487 lbs. in 1926, a r when drouth cut pastures short. y owe about $4,000.

he thing that drew our attention his farm family was the 1926 cow ing report supplemented by a plimentary letter from County nt Watson.

n driving by the farmstead one is impressed because the buildings the very plain, usable kind. ther is there any extravagant out-of shrubbery to attract a passer-But two hours with Mr. Guildner vinced us that all gold does not essarily glitter.

We found Mr. Guildner mowing second cutting of alfalfa. Being ranger it took about five minutes convince him that we had nothing sell. He consented to talk and ed the hired man to continue the ving. We found the shade near house where we questioned and wered the "what" and "how" of ing for a farm.

After a few preliminary questions answers to which gave us the "lay he land" so to speak, or a bit of historical beginning ten years , we got down to dollars and cents asking about income and expendi-s.

Mr. Guildner sent the oldest girl in house to get the account book. er he opened this he indicated for o proceed with questions much as ay, "What do you want to know?" We want to know how you have l for and improved this farm?" we ied.

Suppose," said he, "I give you the unts and sources of income and enditures for 1918 and 1925. That ought to give you something to work on."

"It would seem so," we replied. "Let's have the figures."

Here are the figures as Mr. Guildner gave them to us:

In 1918 when prices were relatively high their gross income was $4,873.11. This income came from the following sources: hogs, $2,073.15; cattle including calves, $855.97; poultry, $257.08; eggs, $345.25; butterfat, $962.90; miscellaneous including potatoes, $378.76.

The expenditures for that year, a time also of high relative costs, amounted to $2,770.23. These expenditures were made for the following purposes: feed, $1,313.57; labor, $174.56; cattle, $470; seeds, $33; taxes, $71.60; interest, $243; miscellaneous items, $464.50.

The difference between gross income and the above expenditures was $2,102.88. Nothing has been included in the expenditures for family living and for labor. What they did with this money is perhaps best explained in the fact that they completed paying off the 72½-acre farm mortgage in less than ten years.

In 1925, a year of comparative lower prices, their gross income was $4,589.65 or $283.46 less than in 1918. This gross income came from the following sources: butterfat, $1,841.96; hogs, $1,146.29; cattle including calves, $406.96; eggs, $439.98; poultry, $197.54; wheat, $181.09; miscellaneous, including potatoes, $375.83. The expenditures for 1925, a year when costs had not come down proportionately with prices, were $1,525.88. Those were for the following purposes: feed, $477.75; live stock, $415.51; labor, $250.75; cream hauling, $91.05; miscellaneous, including taxes and interest, $291.10. The difference between gross income and the above expenditures was $3,063.77. A recent letter from Mr. Guildner states that he has sold $2,818 worth of hogs in 1926 and has 50 fall pigs and 7 brood sous left.

What do we learn from these figures? First, let it be noted that the expenditure for feed was $835.92 less in 1925 than in 1918; second, the income from butterfat for 1925 was $879.06 greater than in 1918. Butterfat was higher in price in 1918 than in 1925. How did Mr. Guildner spend $835 less for feed and produce $879 more of butterfat when it was a lower price per pound in 1925? Did he milk more cows and if so, how did he feed them if he spent only $477.65 for feed? Did he feed them better? Did he have better cows?

The answer to most of this is found in the fact that the same cows that averaged 384.3 lbs. fat in 1923, averaged 445.3 lbs. in 1924, 498.6 lbs. in 1925, and 487 lbs. fat in 1926. This was done with grade Holstein cows on twice-a-day milking.

Reading between the lines we know first that the production of feeds best suited for dairy feeding was greatly improved on this farm. In the second place we know that Mr. Guildner knows how to get about all the milk out of a cow she is capable of producing. Think of it—498.6 lbs. fat from grade cows!

After improving the production of crops to support adequately a herd of good cows, Mr. and Mrs. Guildner do not put all their eggs in the milk pail. Note the sources of income in 1925. There were $1,146.29 from hogs, $439.98 from eggs, $197.54 from poultry, $181.09 from wheat, and some from potatoes included with the miscellaneous receipts.

"Where corn, barley, skimmilk, and alfalfa pasture are available on the farm one can make a profit producing pork," said Mr. Guildner as he called a bunch of May pigs from the shade for inspection. He was proud to say that these pigs had been grown mostly on alfalfa pasture, a little ground barley and ear corn, and skimmilk not needed for the poultry.

They took in $637.52 from eggs and live poultry last year and the fact that they have this year 300 laying hens, 200 spring hatched chickens, and about 30 young turkeys indicates that they didn't cut into their working reserve to do it. Then there is usually some wheat and some potatoes to sell for cash.

The distribution of crop acreages last year was as follows: corn, 40 acres; oats, 24 acres; barley, 10 acres; winter wheat, 7 acres; potatoes, 2 acres; alfalfa, 7 acres; clover, 6 acres; pasture, 7 acres; remainder in truck crops, farmstead, and miscellaneous small items. Beets are grown for the poultry. Soy beans are grown with a part of the corn.

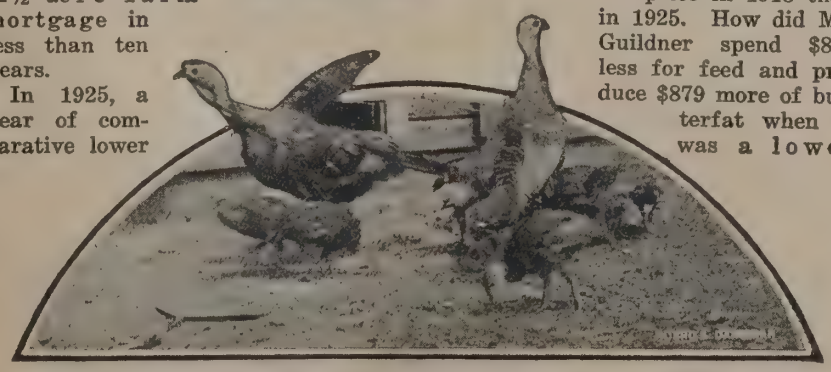
We asked Mr. Guildner who or what had influenced him most in his success with cows.

"John Tyner gave me the most valuable advice I have ever had," he replied.

"And who is John Tyner? What was that advice? Why was it valuable to you?" we asked.

"Mr. Tyner is a dairyman in this county. He took more milk to the station than any other man from a similar number of cows. He once told me never to keep more cows than I could properly feed. He told me to grow all the good roughage I needed to feed the cows I kept all they would eat. Then the cow tester came along nearly 5 years ago and helped me to improve on Mr. Tyner's advice by getting me to feed more protein in the grain mixture. I had been feeding too much corn and barley. My cows fattened too much instead of putting all the milk they were capable of producing into the pail. Since then I have been trying to get all the milk I could from the cows and not hurt them."

(Continued on page 910)



Mr. Guildner was mowing the second cutting of alfalfa. In the lower picture he is shown on the left telling the hired man what fine hay alfalfa is for dairy cows.

THREE OF THE GUILDNER CHILDREN

Milk, play, and sunshine are helping to develop strong bodies.

With the Guildners variety is not only the spice of every day's work but is also the source of a satisfactory income. These turkeys are a part of the variety.

THE 1927 OHIO STATE FAIR

THE inventive genius of man in league with labor, capital, materials, and transportation has put Ohio in third place among all states in the value of industrial production.

On the other hand, the skill of Ohio farmers in league with soil science, sunshine, rain, and the husbandry of live stock has put Ohio in seventh place in the value of farm and animal products.

All this is reflected at the Ohio State Fair, an institution of education and entertainment now seventy-seven years old. To say that the Ohio fair is the greatest state fair among all others would, of course, draw fire in the argumentive pride of citizens in other states where good state fairs are held.

Pride in one's possessions and accomplishments is a potent factor in the path of progress. Ohio people are proud of their agricultural and industrial accomplishments. Let us say that Ohio had this year one of the several great state fairs and thereby avoid unprofitable comparisons and controversy.

The outstanding educational feature of the Ohio State Fair this year was the large numbers of animals entered and shown in the different classes of live stock together with the studious, attentive ringsides where judging was in progress.

In numbers there were 58 exhibitors with 286 draft horses; 81 exhibitors with 675 beef cattle; 138 exhibitors with 760 dairy cattle; 134 exhibitors with 1,342 swine; 195 exhibitors with 1,710 sheep. In all there were 606 exhibitors with 4,773 animals. The poultry building was filled to overflowing. It was a fine place to compare the good ones with those not so good whether it be sheep, horses, swine, beef or dairy cattle.

Farms cannot be operated and the people of a state served without power and machines. Next to live stock in point of educational interest we would place the machinery exhibits and demonstrations. Modern tillage and harvesting machines as well as many labor saving devices for the farm or home were on display in action for those who were interested in getting things done.

To us, the exhibits from the Ohio State University were worthy of a great fair.

The corn borer exhibit was perfect in showing what the borer is and does from planting time till corn is ready to put in the crib. This was shown by actually having a small corn field with rows of corn in the various stages of growth from corn just up on through the season to the fully matured plants.

The State Bureau of Animal Industry had a very fine exhibit on animal disease control work, with particular emphasis on the eradication of tuberculosis.

The animal husbandry department of Ohio State University gets credit for a very good dairy herd improvement story told graphically with pictures, charts, cows, feeds, costs, and profits. Cow testing associations and some breeding work supplied the essential data.

The soils department of Ohio State University had a unique but effective way of telling the losses in farm manures under different methods of management. Hauling direct to the field conserves the most fertility.

The dairy building did not serve the purpose for which it was intended. Whatever the reason, it was a disappointment to those really interested in the manufacturing part of dairying. The building should have been devoted to showing how dairy products are made and to quality control work and such like. It had none of this.

The fact that there were more dairy cattle than beef cattle exhibited, if we do not include the carlot entries of beef cattle, shows that Ohio is giving considerable attention to dairying. Let us see who showed the good ones.

Jerseys

Judge: Thompson Weber, Kentucky.

The Jersey show was not up to what one expects in Ohio where many good ones are produced. Of the cattle that were there, a good many of the best ones came from other states. Outstanding tops were hard to find, and animals not reasonably well fitted were quite in evidence. This, with the differences in type, gave judge Weber plenty to do.

In the single entry classes The Oaklands of Michigan divided with Longview Farm of Missouri with five firsts each. R. L. Wilmoth of Kentucky got 2 blues and Pebble Hill Plantation of Georgia got 1. In the groups, Longview got 4 firsts to 2 for The Oaklands. In the championships, The Oaklands won senior and grand champion purple on Blonde's Xenia Sultan. Longview's Raleigh's Eminent Sultan was a very good junior champion bull. The Oaklands likewise won the purple on Oakland's Roella C., she beating Wilmoth's junior yearling heifer, Judie's Fairy Warnetta.

Holsteins

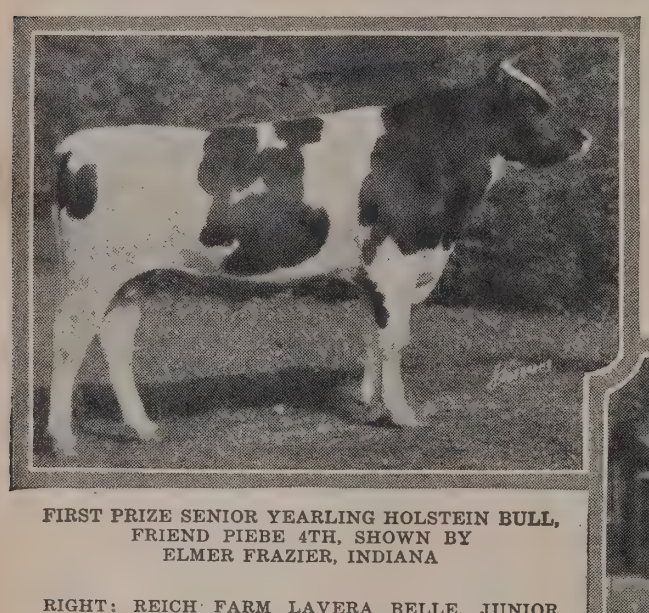
Judge: Axel Hansen, Minnesota.

The Holstein show was much improved over last year. Forty-two exhibitors brought out 198 animals. Outstanding in the Holstein classes were the very good first prize animals. It was the opinion of judge Hansen that no state fair will have a better aged bull class. It was the general opinion of the ringside that the top females when brought in for championships averaged the best ever seen at an Ohio State Fair. Tops in bull classes were nearly as good. is interesting to know that first p in the six bull classes went to 5 di ent exhibitors. As in the Je classes, out-of-state exhibitors wa away with a good share of the mo

In the singles, Elmwood Farm, nois, got 6 firsts; A. H. Buhl and troit Creamery of Michigan, two e and Elmer Frazier of Indiana, R Certified Dairy and F. D. Koon, Ohio got one each. These same hibitors got 7 of the 12 second pl Elmwood leading with 4 followe Rock River Farms, Illinois, wit H. S. Firestone of Ohio and A Randolph of Illinois each got a ribbon.

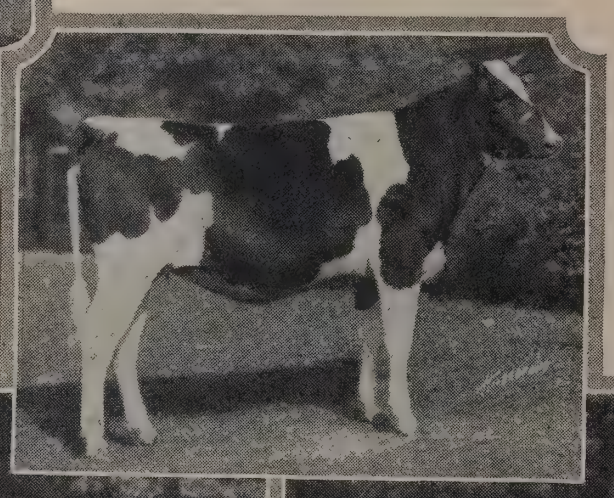
In the groups, Elmwood got 3 f and one second; Frazier got one and one second; Rock River Fa got one first and one second.

The purple ribbon for the se and grand champion bull went Elmwood on Sir Fobes Orn Hengerveld; Detroit Creamery g junior purple on Decreamco Cala Posch as also winning senior grand champion female on Lady B Jewell Fayne, a cow good enoug win the same honor a year ago at Michigan State Fair and later the National winner a close shave the championship. Reich Cert Dairy brought out the junior ch pion female, Reich Farm La Belle.



Guernseys

Judge: L. R. Fairchild, Indian



Ringside opinion held that the q ity of cattle among Guernseys sh was better than last year. Thirty exhibitors brought out 181 head. C breeders suceeded in holding mor the first and second prize money home than was true with Jerseys Holsteins. The bull classes w good in places and then there w bulls that could well have been f at home. The aged bull class headed by last year's grand champ Sargeant's Governor of Montr He, together with last year's gr champion female, Sepascot Per were the outstanding individuals the show. The female classes w much more uniform than were bull classes. The aged cow class cluded several right good dairy c not quite good enough for fast sh company.

Of the 14 first places awarded in the singles, Gayoso Farms, Mississippi, won 4; H. S. Firestone, Ohio, 3; Geo. M. White, New York, 2; Geegland Farm, Indiana, Myron A. Wk Ohio, C. C. Balton, Ohio, Meyer & Shade, Indiana, and Ohio State Uiverity, won one each.

RIGHT: REICH FARM LAVERA BELLE, JUNIOR CHAMPION HOLSTEIN FEMALE, SHOWN BY REICH CERTIFIED DAIRY, OHIO

FIRST PRIZE GUERNSEY GROUP, THE GET OF LANGWATER ACTOR, SHOWN BY GAYOSO FARMS, MISSISSIPPI

FIRST PRIZE JERSEY GROUP, THE GET OF EMINENT'S DARK RALEIGH, SHOWN BY LONGVIEW FARM, MISSOURI

Minnesota State Fair and Northwest Dairy Show

MINNESOTA always has a good state fair as well as a big one and her efforts in that direction this year were quite up to standard. It was a fair to interest every one be he farmer or city dweller, professional man or laborer. Unfortunately, the weather man did his best—or worst,—to put a damper on it and for two or three days at least succeeded to the extent that the attendance was kept well below the usual standards. It takes more than a little wet weather to make that fair a failure and just as soon as the skies began to clear, the turnstiles started going.

What are the products of the cow? The best exhibit we saw at Minnesota, and one of the best such we have ever seen answered that question so thoroughly that dairy farmers and their city cousins must both have been surprised when they saw it all. Capitoned, "The Cow's Contribution to Civilization," was an exhibit of articles other than food, many of which most of us would never credit to the cow. There was jewelry, toilet articles, leather goods, a child's playthings, an old picture sized by a caesin product and even cigarettes on which are used caesin glue. It was just a little better quality. There were 590 head of dairy animals, in addition to 187 in the junior show, exhibited by 91 breeders from 8 different states. The ringside was attentive, eager in anticipating the placings and courteous in accepting the decisions of the judges. It was a show to interest a dairy cattle breeder whatever his breed preference might be.

FIRST PRIZE HOLSTEIN GET OF SIRE BY FORUM PATRIARCH
OWNED BY FORUM FARM, IOWA

Brown Swiss
Judge: J. P. Eves, Iowa

The Brown Swiss show this year was almost an imported one for with the exception of 3 calf club entries, the 54 head were owned by 4 out of state exhibitors,—the Iowa Brown Swiss Co., Mooney & Larrabee, and H. A. Mabon of Iowa, and N. C. Schmid of Wisconsin. The Iowa Brown Swiss Co. had the largest herd and they were by far the heaviest winners for they took 10 first prizes while Mabon won two and the other two, three each. The championships were more evenly divided.

Judge Eves put the senior and grand bull championship on Mabon's Betsy Bravura Prince, quite a smooth 2-year-old that was beaten the week previous by Believe's Grandson 3d of Far View, the Iowa Co.'s winning aged entry. Mooney and Larrabee had the junior champion, Bob Granger, a junior yearling.

There were several good aged cows shown, with the top, June's College Girl, far and away the best representative of the breed to enter the ring. A breed champion with 1,062 lbs. of fat, she looks the part, and made an excellent grand champion. Two other Iowa entries stood next to her, with Cinnamon's Maiden, the winning Wisconsin entry, in 4th place. Schmid's calf, Evelyn of Meadow Green, was junior champion.

Jerseys
Judge: J. B. Fitch, Kansas

There were 117 Jerseys shown by 19 exhibitors this year, with all of the first prize winners representing five herds. W. S. Dixon, Wisconsin, showing about half of his entire herd, had eight firsts, Wm. Knight, also of Wisconsin, won 2 blues, Meredith Jersey Farm, Iowa, took one, and Wardmere Farms, Missouri, won 4.

In the aged bull class, there were two outstanding, Blond's Oxford Baron owned by Wardmere Farms and Glory's Interest Lad from Dixon's string. The latter has all the advantage in depth and is a very good bull otherwise, but he does not have the style nor quite so good a head and neck as the Georgia entry and the judge put the southern bull up. The one other outstanding bull was the junior champion, Bessie's Fontaine's Duke, Dixon's senior yearling. He was good enough to win grand championship at Wisconsin a week earlier and was second only to the aged bull here.

Meredith Jersey Farm made their first strong bid for a blue ribbon when the aged cows were led out, winning it on Successful Golden Cowslip, a very trim little 6-year-old that has three earlier Minnesota grand championships to her credit. She freshened at noon on show day, won her class an hour later, and before the day was over, won her fourth grand championship.

Knight's junior yearling, Modesty's Golden Juliette, was junior champion.

The three county Jersey herds, Becker, Hubbard, and Hennepin, placed in the order named.

Ayrshires
Judge: J. B. Fitch, Kansas

There were just 4 Ayrshire exhibitors, Adam Seitz & Sons and B. B. Simmons & Sons of Wisconsin, Fairfield Farm of Kansas, and Wm. Waugen of Minnesota, with a total of 61 animals, but it was a good show with close competition to interest both judge and spectators. Seitz won 9 blues and 7 red ribbons, Fairfield had 7 firsts and 3 seconds, and Simmons came third with two class leaders and a half dozen in second. Seitz led in championship winnings, too, with both juniors besides the senior and grand champion bull.

The grand champion cow, Cairncroft Primrose, a four-year-old owned by Fairfield Farms, was probably the best single red and white shown. She is a cow with plenty of substance, good top and bottom lines, and a good udder and while she

THE 1927 WISCONSIN STATE FAIR

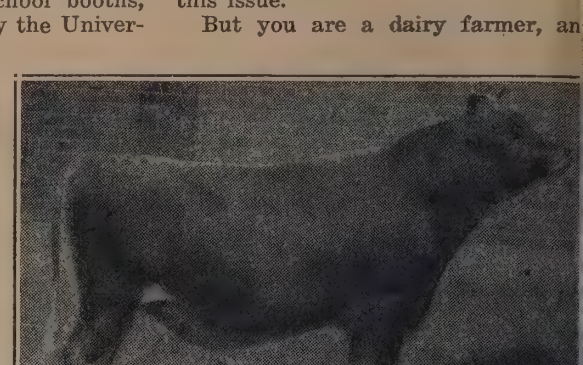
STATE fairs serve two big purposes, so far as a majority of the visitors are concerned,—education and entertainment. The 1927 Wisconsin State Fair provided both those features. The thousands of visitors who attended, whether from the city or country, had ample opportunity to learn many useful lessons and at the same time there was plenty to entertain them—horse and auto races, band music, the horse show, free acts in the grandstand.

KNIGHT'S NELLIE DEAR, GRAND CHAMPION JERSEY COW
OWNED BY THE OAKLANDS, MICHIGAN

The farm and the farmer are essential to the success of the state fair. They are responsible either directly or indirectly for the existence of such an institution. Badger State farmers made their 77th annual state fair worth while by patronizing it with their products and with their presence.

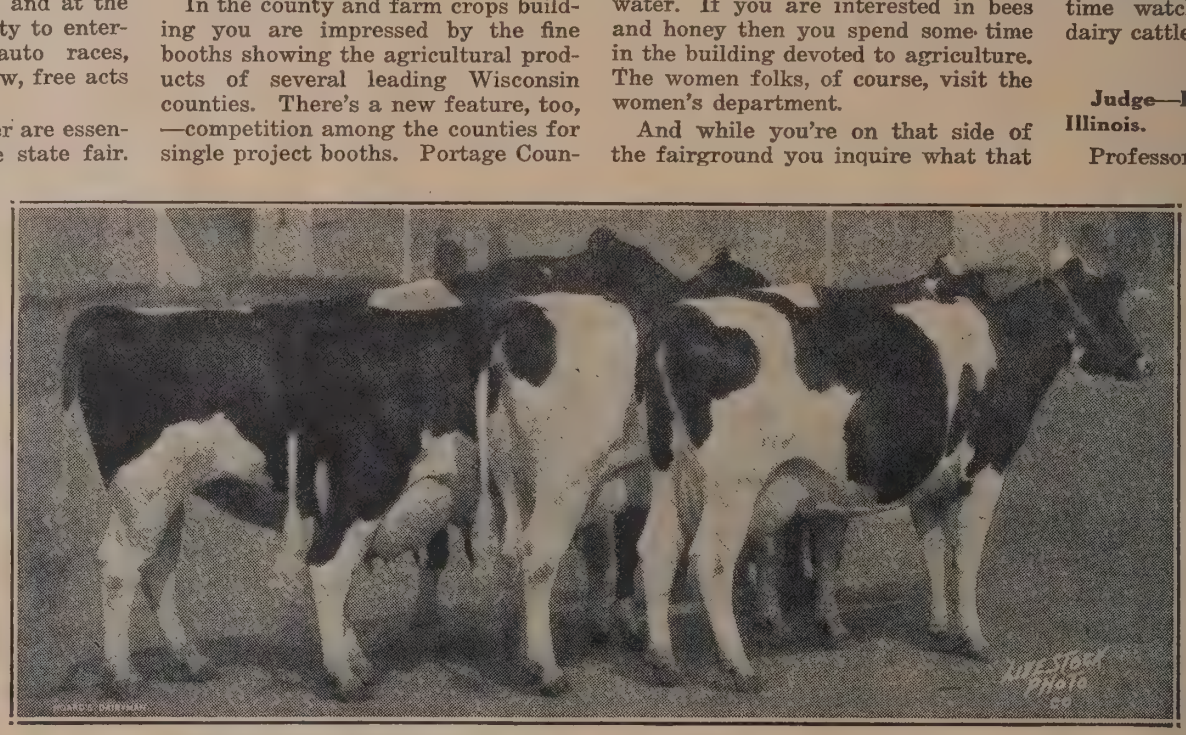
That farm and factory must prosper together was demonstrated in the great industrial exposition fostered by the Wisconsin Manufacturers' Association. A trip through the manufacturers' building gives you considerable useful and interesting information and a clearer picture of what it means to "be a Badger." A fine exhibit showing how paper is made was one of the many instructive displays.

The newly organized National Cheese Institute, of which J. D. Jones, Jr., is the head, co-operating with the Wisconsin Cheese Producers' Federation and the Wisconsin College of Agriculture, has an exhibit which attracts your attention in the dairy building. The story of cheese is told by movies. An ancient Asian traveler poured milk into a bag made from a sheep's stomach and when he went to get his noonday drink, discovered that the milk had been changed by the rennet into a new product, cheese. You are told by a placard that Wisconsin produces 375 million pounds of cheese annually or 72% of the entire United States production. You learn that you should eat more cheese because it is high in food value, economical, convenient, has no waste, promotes health, growth, energy, and vigor. You see delicious, appetizing food dishes prepared from cheese. Your respect for cheese is increased and your appetite for cheese is stimulated by the things you see and read and by talking with Harold Frost who is in charge of the exhibit.



In the county and farm crops building you are impressed by the fine booths showing the agricultural products of several leading Wisconsin counties. There's a new feature, too,—competition among the counties for single project booths. Portage County won first with a demonstration entitled "Destroy the Rat" and you read that rats do almost a half million dollars' worth of damage annually. You learn methods of extermination. Pierce County tells you that marketing eggs co-operatively pays. Waukesha County expounds the value of herd improvement. Another county compares good and poor pastures and tells how to have good pastures. Still another county explains its work in reforestation; a valuable lesson in every booth.

The educational building contains many exhibits which interest you. Besides the many rural school booths, there are fine exhibits by the University of Wisconsin and Marquette University. You are fascinated by the marvelous feats accomplished by blind students from the School for the Blind at Janesville who work and play with a precision and a smile that is inspiring.



Then there are the live stock and poultry exhibits — hogs, sheep, horses, beef and dairy cattle, and you can spend some profitable hours in the barns studying breed type. The horticultural building is filled with the sweet scent of flowers and the luscious fruit in attractive displays fairly makes your mouth water. If you are interested in bees and honey then you spend some time in the building devoted to agriculture. The women folks, of course, visit the women's department.

And while you're on that side of the fairground you inquire what that tent city is doing over across the creek, and you find out that some 630 4-H club folks, the junior department of the fair,—a growing and important department, too,—are camping there for the week. You are informed that 4-H club boys and girls showed about 314 dairy calves Monday, the first day of the fair, in what was one of the largest and best competitions of its kind ever held, and that in addition 4-H club members are exhibiting 96 hogs, 48 sheep and 260 poultry entries. For a more complete report of the junior department at the Wisconsin State Fair see the junior pages of this issue.

But you are a dairy farmer, and your trip to the state fair would be incomplete without spending some time watching the judging of the dairy cattle. So, on to the arena!

FRENCHMAN SPREADING LIQUID MANURE IN AN APPLE ORCHARD WHERE THE GRASS IS CUT FOR HAY

LIQUID MANURE AND THE EUROPEAN FARMER

GUY A. PETERSON, WISCONSIN

THE use of liquid manure for increasing crop yields is common in many parts of Europe. This is especially true in hilly dairy sections. As one goes about from country to country he cannot help but be impressed by the care that is taken to preserve not only the solid manure but the liquid as well.

One can see almost every conceivable kind of a team hitched to the barrel wagons that are used for spreading the precious fluid on the fields. There will be one horse outfits, two horse teams, cow teams, oxen teams, or any combination of cows, horses, and oxen that one may wish to name. The humble cow is made to do this service more often on the very small farms than on the large ones, but it is generally conceded that a cow cannot give so much milk when she is used as a beast of burden all day. The Polish people and Russians in Russian Poland, however, do not like to drive cows, so one rarely sees these animals working in the fields of western Poland, but they are very common in southern Germany, France, and Switzerland.

Clean Barns With Hose

Some farmers convert practically all their stable manure into the liquid product. In summer time, especially, this is so. We talked with several small farmers in Bavaria who cleaned their barns in summer with a hose and stream of water. All the liquid ran into an underground tank where it was allowed to ferment for a month or six weeks, after which it was stirred up and hauled out.

The tanks for spreading the fertilizer hold all the way from 50 gallons to 200 gallons, and there may be some even larger but we saw none. They are filled in various ways. Farmers living on a side hill usually have their tank on the lower side of the barn. A six-inch pipe is run out from the lower end of this tank and the barrel spreader is filled by gravity some feet farther down the incline.

When the farm is on a plain many kinds of devices have been worked out to get the manure out of the cistern into the spreader, but the electrically driven pump is becoming very common in Switzerland and Bavaria, though the old hand pump is still used by thousands of peasants and even by middle class farmers.

Cut Grass With Scythe

Ernst Schneider, a Swiss immigrant who was graduated from the University of Wisconsin last year, has had considerable experience with this type of fertilization. When he was a lad of 12 years he used to go out in his father's orchard at four o'clock in the morning to cut grass for their 16 Simmenthal cows with a scythe, and the scythe is still used to cut the grass in this orchard. Even in summer the cows on this farm are fed in the barn, for barn feeding is a universal practice in many sections, especially on high priced land.

Schneider says, "The liquid manure tanks in Switzerland are almost always located in front of the barn in order to facilitate the running of the liquid by gravity into the spreader. The tanks are of such size as to accommodate the waste of one month or more. During that time fermentation takes place, and when the liquid is brought onto the field it has an effect at once. The liquid is always spread after the grass has been cut.

Manure Piles Drain Into Tanks

"Most farmers," continues Schneider, "also have a concrete tank underneath each manure pile in order to catch all the leakage. This leakage is rather strong, so before using it is always pumped into the regular liquid manure tank and mixed with the fluid already there. It is this seepage material that one can see staining the snow a deep brown as it runs from the manure piles in so many yards in America.

"Once every year, or every other year, each parcel of land gets a heavy covering of Thomas slack, a by-product of the steel industry, very rich in phosphorus and calcium. The liquid manure contains mainly nitrogen and potassium, so a fertilizing practice of this nature keeps up the four main plant foods, phosphorus, nitrogen, calcium, and potassium, in the proper proportion for a maximum growth."

Although much of the work on the Schneider farm is done by hand because of the rough topography, the home is equipped with many modern conveniences. Electricity is used in the farm business for pumping the liquid manure from the tank under the manure pile and from the large tank into the barrel spreader. It operates their wood saw, hay and straw cutter, and feed grinder. It is used for running the straw presser and turning the cider mill. In the home it is utilized for heating and lighting the rooms, cooking, heating water, and ironing, in addition to many minor uses such as heating the curling irons and toasting bread.

The Schneiders have a continual supply of running water without having to pump it. It is piped from the springs in the mountain side and lead into the house and barns as desired. Ever running water hydrants is one of the most characteristic features of a Swiss village, and it is this constant supply of cold running water that accounts in great measure for the high quality of cheese made in the land of the Yodlers.

Underground Manure Pipes

One of the most interesting liquid manure outfits that we saw in Europe was on a colonization farm at Buck, Switzerland, some miles out from Zurick. The Swiss government had reclaimed this 80-acre farm from worthless peat marsh, and had underlaid it with a system of pipes that was connected with the liquid manure tank at the barn. An electric pump thoroughly mixes the liquid and pumps it into the piping system where it is distributed to any field that needs it.

The owner of this farm was an interesting immigrant from Bavaria. He had contracted to pay the government a price equal to the cost of draining the land, laying the underground manure system, and erecting the buildings, all of which were modern. We were on the farm in the spring of the third year of cultivation, and he seemed to be well satisfied with his purchase. He had nothing but praise for the liquid manure equipment, for with this he could get the fertilizer into the fields when they were too soft to be driven on with a team and spreader.

Has Modern Equipment

The ideas in practice on this farm seemed to have come from many countries. Being a progressive farmer he did not drive his cows, but did the majority of his team work with Belgian horses imported from Denmark. The day we were there he was planting potatoes with a German built planter pulled by a caterpillar tractor made in America. His cows were tethered in the pasture after the fashion employed in Denmark.

His barn was equipped with many modern appliances. A ventilating pipe underneath the feed manger gave the cows fresh air from the outside. In place of stanchions the cows were tied, when in the barn, by light chains around their necks. These were fastened to rings which slipped up and down on perpendicular chains. The farmer said this arrangement was much more comfortable for the cows and considerably cheaper than the regular type of stanchion. When he unloaded the hay that was cut from the liquid manure fertilized fields, the whole load, rack and all, was elevated into the mow at one operation.

SIMMENTHAL COWS TETHERED IN A SWISS PASTURE THAT IS SPRAYED WITH LIQUID MANURE FROM UNDERGROUND PIPES

The owner of this farm is a Bavarian immigrant, which accounts for the Bavarian costume on the boy.

PUMPING LIQUID MANURE INTO A BARREL TANK ON A FRENCH FARM

The brush in the corner are willows that will be used for basket making.

A SWISS ORCHARD DAIRYMAN SPREADING LIQUID MANURE IN AN ORCHARD

Liquid Manure Drill

German experiment stations find that liquid manure when applied with a specially designed liquid manure drill gives as good results as a top dressing of sodium nitrate. Even away out in India, experiments are being made with this valuable fertilizer, and a station there has found that much of the nitrogen loss from liquid manure can be prevented by covering the liquid with a thin layer of kerosene oil. This precaution is more necessary in warm climates than it is in cooler regions.

In a way it seems strange that so little attention is given to this liquid in America. There are literally hundreds of thousands of little brown rivers of valuable plant food seeping into the creeks and streams of our land. It would be difficult to estimate the total preventable loss of fertilizer from even the best farmers' yards. We once had occasion to make a suggestion to a German farmer concerning the use of machinery and he perhaps rightfully rebuked us by saying, "I've been in the United States and have seen how you waste manure, so you needn't tell us how to plant potatoes when you cannot see any better soil conservation example than you do."

Rearing Calves With Calf Meal Gruel

New York Cornell Station Bulletin 439 reports experiments in the use of a calf meal for raising calves.

The average feed consumption from birth to six months of age was for the Holsteins 518 lbs. of whole milk, 287 lbs. of calf meal, 412 lbs. of hay and 189 lbs. of dry grain. Good growth was made, the average gain in live weight per calf being 297 lbs. Several of the calves showed a setback in the regularity of their gains following the complete change from milk to gruel.

A study of the residual effects on the calf meal indicated that the calves raised on this meal were in no way handicapped in their development, some having already produced calves and others are approaching maturity.

For it stirs the blood of an old man's heart
And it makes the pulses fly
To catch the thrill of a happy voice
And the light of a pleasant eye.—WILLIS.

A: "What is a bigamist?"
B: "A man who makes the same mistake twice!"

Adam Seitz Passes Away

Adam Seitz, well known Ayrshire eeder of Waukesha County, Wisnsin, passed away September third er a lingering illness. He was 59 rs old.

The farm firm of Adam Seitz and ns has been a bright star in the

ADAM SEITZ

rshire firmament for many years, l the success of Seitz Ayrshires in show ring at leading fairs and ositions in the United States has n outstanding. Since 1912 they e won 2,778 first prizes, champions l grand champions, 36 silver cups, gold, silver and bronze medals and breeder and exhibitor diplomas.

dam Seitz owned and has lived for 2 years on the Spring City Stock m near Waukesha. There are 286 es of land in the farm upon which roximately 125 pure-bred Ayre cattle are kept. Adam Seitz chased his first Ayrshires in 1899 l has made several importations. . Seitz has been a director of the ional Ayrshire Breeders' Associa- since 1907 and vice president e 1912. He has been active in al, state, and district breeders' orizations.

ome of the famous herd sires on Seitz farm include: Imp. Bargeh Gray Cavalier, Cavalier's Lord wart, Imp. Howies' King of arts, Cavalier's Lord Roseberry, alier's Ping Pong, Cavalier's Cup rer, Cavalier's Bobby Vernon, alier's Lord Messalliance.

dam Seitz and Sons have done ch for the advancement of the shire breed. Mr. Seitz leaves five s, Louis, Roy, Earl, Floyd, and bert, two daughters, Elnora and ma, and his wife. The farm and eding establishment is being conued by his sons who have assumed ch of the active management in ent years.

The National Dairy Exposition

ndicative of the growing interest lairying by the younger generation he announcement by Dr. C. H. e, chief of the Agricultural Edu- on Service of the Department of iculture, that 26 states will be resented by teams of boys in the ational contests which are to be l this year at the National Dairy osition at Memphis, Tenn., Octo- 15—22.

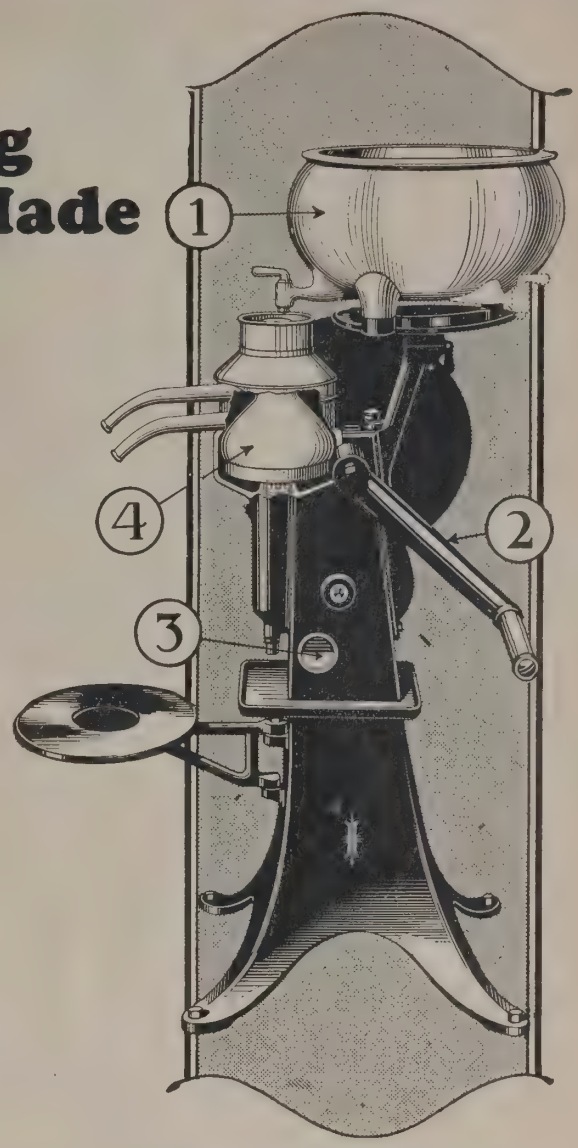
he states are Wisconsin, Illinois, higan, Minnesota, Vermont, Massusetts, Connecticut, New York, v Jersey, Pennsylvania, Maryland, o, Virginia, North Carolina, South olina, Arkansas, Tennessee, Kenky, Missouri, Nebraska, Kansas, Oklahoma, Texas, Colorado, and California.

About 50 per cent of the states will have their teams participate in a milk judging contest.

The teams are now being selected in a series of elimination contests which start in the communities and then become state wide. Each team will be composed of three boys and an alternate.

Boys on the official judging team are required to have had at least one year's systematic instruction in dairy husbandry which includes practical dairy work at home under the supervision of an agricultural teacher. The boys, in the greater number of instances, have had dairy calf projects which include the keeping of dairy records and the management of dairy herds. "In other words, the instruction in dairy husbandry has been based upon problems of dairying at the home of the boy," writes Mr. Lane.

"The Sweetest Running Separator Ever Made By Man"—



This statement was recently made by a user of one of the new 1927 Series De Laval Separators. Users everywhere are enthusiastic in their praise. One says, "They are perfection, and then some," and all seem to feel they have received more separator value in their new De Lavals than was ever before possible to obtain.

Unquestionably these new De Lavals are the crowning achievement in the 49 years of separator manufacture and leadership of The De Laval Separator Company, and are superior in every respect—in skimming efficiency, ease of operation, convenience and durability.

New De Lavals
Soon Pay for Themselves

If you are using an old, worn or inferior separator, a new De Laval will save enough cream which you may now be losing to pay for itself. Ask your De Laval Agent to show you one. You will appreciate the new features. Then run the skim milk from your old machine through the new De Laval, and if you are losing any butter-fat it will be recovered. Have any such cream weighed and tested and then you can tell exactly how much a new De Laval will save for you. Thousands have tried this plan and have been surprised at what they were losing.

Trade allowance made on old machines of any age or make. New De Lavals sold on easy terms or installments.

New Features:

1. Turnable Supply Can. A handy feature—saves time, lifting and stooping.

2. Easier Turning. These new De Lavals are easier to start and turn than any others.

3. Oil Window. This new feature enables you to see how your separator is being oiled and shows you the condition of the oil.

4. Floating Bowl. Self-balancing, runs smoothly and without vibration, delivers a smoother, richer cream, and requires less power.

The De Laval Separator Company

San Francisco 61 Beale Street

New Zealand Dairy Co-operative Mines its Coal

The seventh annual report of the New Zealand Co-operative Dairy Company, Ltd., Hamilton, New Zealand, recently received, indicates that this producer-owned enterprise is still one of the larger of the co-operatives for the marketing of dairy products. During the 1925—26 season the association received 259,778,595 lbs. of milk and 85,978,856 lbs. of cream. Its output of dairy products was as follows: butter, 49,875,539 lbs.; cheese, 10,677,991 lbs.; casein, 2,065,238 lbs.; milk powder, 5,062,345 lbs. Sales of dairy products amounted to approximately $18,100,000 for the year. The principal items making up the total were: butter, $15,452,000; cheese, $1,802,000; milk powder, $683,000; casein, $181,000.

Dairy products are exported largely to the British markets, the association having an office in London with its own representatives in charge. The best grade of butter is marketed under the "Anchor" brand. The association is adding to its present equipment a large butter factory, centrally located. Besides plants for making butter, there are 15 cheese factories and 3 plants for manufacturing milk powder.

A coal mine has been organized as a subsidiary of the dairy products co-operative. The coal is used largely to supply the various plants operated by the parent company. Sales from the mine for the 1925—26 season amounted to more than $500,000.

Another subsidiary enterprise is the New Zealand Dairy Finance Company, Ltd., which it is stated "has already been of considerable assistance to many of the company's shareholders."—Agricultural Co-operation.

If you want extra traction and long tread wear in addition to balloon tire comfort, be sure you get this quiet-running *new-type* Goodyear All-Weather Tread

You can see it before you buy

The right size and type of tire for your car is carried in stock by your local Goodyear dealer; *you can see it before you buy.*

And after you buy, that dealer will back up the tire's superior quality with a service designed to *insure* you the lowest cost per mile.

He sells the world's finest tires at a range of prices to fit any pocketbook; the values he offers are dependable and real.

He puts the tire you buy on the rim for you, fills it with air, and throughout its life helps you give it the care it should have to deliver maximum results.

The Goodyear dealer s service will cut your tire bills down. Save you time and trouble. Make your tire money pay bigger returns.

It is part and parcel of the Goodyear policy: *to build the greatest possible value into Goodyear products,* and *to provide facilities so that users can get all this inbuilt value out.*

Goodyear makes a tire to suit *you*—whether you want the incomparable All-Weather Tread Goodyear, the most famous tire in the world, or the lower-priced standard quality Goodyear Pathfinder

Goodyear Means Good Wear

GOODYEAR

Seasonable Live Stock Note

OCTOBER is near; we are reminded of its coming by chilly dawn and early dusk. October brings us the answer to our season's labor for a corn crop. No longer do we worry about wind and hail, about bugs and blight. Our labor and the use of land are represented by feed crops ready for the continued husbandry of live stock. What can we do now to be forehanded in contributing to their welfare?

Put Herd in Cow Testing Association

Based on the assumption that every farmer desires to sell his feed crops through live stock for as much money as possible, we venture the suggestion that now when the barns and bins are full is a good time to begin finding out what kind of cows we have through which to market our feeds. So far as the milking herd is concerned, we can think of no one thing of greater importance right now than that of putting the herd in a cow testing association. It will do more toward selling feed crops for good prices than anything we know of provided, of course, the tester is big enough for his job and the members work with him.

Husking Corn With Hogs

How times change! Thirty years ago turning a bunch of shotes in the corn field to help themselves would have been looked upon as a lazy man's way of harvesting the crop. Today one is behind the times if he does not know something about hogging down corn. Many experiments have proved the economy of the practice when rightly done. A suitable supplement is of greatest importance. If good forage is available near the corn, it will serve a very useful purpose. Alfalfa, rape, and clover are best in the order named. If forage is not available, tankage or skimmilk is best. A mixture of tankage 70 parts, linseed meal 15 parts, and shorts 15 parts is better than tankage alone. Skimmilk is fed at a rate of 3 lbs. for each pound of corn consumed or about a gallon and a half per head daily.

Feed Mixture for Eggs

As long as we are culling the flock and getting the chicken house ready we might as well finish the job by planning the mash and scratch mixtures to be fed. In every state where poultry is of significant importance, experiments have been carried on to determine good rations for laying hens. Write to your experiment station for this information. If you don't like to write, try the New Jersey mash and scratch mixtures. The mash is composed of 100 lbs. each of wheat bran, middlings, ground oats, corn meal, and meat scraps. ... kept before the hens all the time ... is fed dry. The scratch mixtur... be fed twice daily is made of 100 ... each of wheat, cracked corn, ... heavy whole oats. Don't forget ... shell, green feed, and water.

A Good Place for a Little Disinfectant

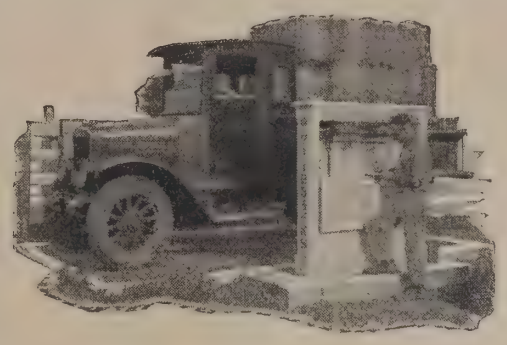
CHAMPION AYRSHIRE COW AT KILMARNOCK SHOW, SCOTLAND

THREE GO-GETTING INTERNATIONALS

Owned by Range & Frank, of Atlantic, Iowa. Left to right, a 3-ton, a 2-ton, and a Speed Truck, 1½-ton, all loaded with stock and ready to set out. These boys have been highly successful, hauling livestock 65 miles to South Omaha. The trucks haul as many as 15 to 20 loads per week, reducing the road time 10 to 18 hours and effecting big savings in shrinkage.



INTERNATIONAL TRUCKS

For Year-Round Service On The Farm

AN International is the natural choice. International Harvester has been building better and better motor trucks for over 23 years, and its history of heavy-duty machine development goes back nearly a century. International Trucks today are an unbeatable product, declared so by a great army of owners. The conservative man places his faith in this good reputation, based on such experience.

International offers the farmer a truck to be proud of, in the size to fit his hauling. Sizes run from the ¾-ton "Special Delivery" and the 4 and 6-cylinder Speed Trucks for 1¼, 1½ and 2-ton loads, up to the 5-ton Heavy-Duty unit. They are on display and sold through 136 International Branches, the widespread Company-owned service organization which International Harvester maintains over this country. It is good to know that service will always be available during the years the truck will be on the job.

Let a good-looking International save time for profitable work on your farm. An International Truck folder will be sent on request.

Work For An International Truck

A load is just so many pounds, or tons, to an International, whether it be milk and cream, livestock, sacked or bulk grain, baled or loose hay, shelled or ear corn, fruit, vegetables, butter and eggs, chickens, coal, lumber and general building materials, feed, or any other of the many products that need hauling to and from and on the average farm. And it will haul trailers, pull scrapers, do road work and even substitute for the automobile in emergency. Body styles provided to suit every need.

Subscription Rates

Subscription in United States and Mexico three years for $1.00; single year, thirty-five cents. Canada, three years, $2.50; one year, $1.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $1.00 a year; not in Postal Union $1.50 a year. These rates include postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers who farm with businesslike methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received thirteen days previous to the date of publication. Advertising to be classified or changes in advertising must reach us three weeks previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Nov. 29-30—National Creamery Buttermakers' Association, Nicollet Hotel, Minneapolis, Minn.

Wisconsin Farm Production in 1926

A study of the 1926 production figures shows that the gross income on Wisconsin farms for that year exceeded 1925 by a little over 6 per cent. There was a decrease of about 10½ per cent in the income from cash crops, but an increase in the income from live stock and live stock products. Comparative figures for

SOURCES OF GROSS INCOME ON WISCONSIN FARMS

the last three years are shown in the following table:

Sources of Gross Income on Wisconsin Farms
(In thousands of dollars, i. e., 000 omitted)

	1926	1925	1924
Milk	$193,624	$191,024	$169,154
Hogs	65,772	51,479	41,631
Eggs and poultry	40,796	37,950	32,086
Cattle and calves	44,020	30,367	26,385
Sheep and wool	2,960	3,173	2,955
Honey	772	1,221	833
Total of live stock products	$347,944	$315,754	$273,044
Potatoes	$ 23,774	$ 29,540	$ 9,400
Tobacco	4,606	5,920	3,215
Canning peas	6,678	6,387	7,643
Hay	6,890	5,369	8,490
Clover seed	2,761	3,387	957
Cabbage	1,436	1,411	1,157
Grains	11,055	12,094	12,286
Fruits	5,289	3,675	3,909
All other crops	5,026	6,847	4,706
Total of cash crops	$ 67,515	$ 74,630	$ 51,763
Total gross income	$415,459	$390,384	$324,807

The gross income figure is made up of the total value of live stock sold and live stock products and the value of the portion of the grains and other crops not fed to live stock. No effort is made to include inventory changes or changes in the value of farm property.

The decrease in income from cash crops is accounted for by the lower value of the 1926 crops of potatoes, tobacco, clover seed, and to some extent other marketed crops. The bulk of the decrease came in potatoes, which crop had a much lower value in 1926 than in 1925 in spite of a larger production.

The increase in the value of the live stock production is chiefly the result of a bigger income from the sale of cattle, hogs, and poultry products, most of which brought somewhat better prices in 1926 than in 1925, and in addition the amount of cattle, hogs, and poultry marketed in 1926 showed an increase over 1925. A new high point in cattle shipments was reached last year when over 405,000 head were shipped to packers and stockyards in addition to record shipments for other purposes.—Wisconsin Department of Agriculture.

Pacific Slope Dairy Show

The seventh annual Pacific Slope Dairy Show will be held in the Municipal Auditorium, Oakland, Calif., November 14 to 19.

The executive committee is composed of Sam H. Greene, C. O. Hagen, C. E. Gray, J. J. O'Neil, George W. Prising, E. A. Greene, and Robert E. Jones, all of California.

The live stock show will be under the supervision of a special committee: R. A. Cordee, Sam H. Greene, G. E. Gordon, W. N. Regan with Superintendent Arthur Folger in active charge. The premium offerings for dairy cattle total more than $7,000.

Superintendent of Dairy Products, G. D. Turnbow, has announced the judges for the Dairy Products Division as follows: milk—S. J. Pearce, Utah, H. E. Ball and C. E. Tegner of California; butter—G. H. Benkendorf and F. H. McCampbell, California; cheese—H. R. Lochry, Utah, O. A. Ghiggoile and C. A. Phillips, California; ice cream—C. A. Phillips, California, and S. J. Pearce, Utah.

How Sperling Succeeded With Cows

HOARD'S DAIRYMAN:—Parents of Fred Sperling would have made him a doctor, and did induce him to enter college for this. At the end of the first year of study Sperling still maintained that he chose to be a dairyman, so he went at the business on a very rough eighty in Pottawattamie County, Iowa, with such common cows as he could buy. That was five years ago, and now Sperling is a success with a herd of Holsteins that supplies a city milk route that includes two hospitals.

In the beginning, Sperling thought he would keep Shorthorns but a trial with a few of them changed his mind, so he began to develop the Holstein herd that he now has. They are the only kind for volume production for the whole milk market, he believes, and he relates changes that he has made since the beginning in his program of feeds and feeding.

Some of his land is so rough that it cannot be plowed, but here and there are spots that can be turned, so these are planted to sweet corn for use if the sweet clover following small grain should happen to turn short. No dependence is placed upon the virgin bluegrass sod of the steep slopes at all. He happens to have land enough in a bottom to give him corn for silage and enough area for the sweet clover pasture following small grain.

"I like to sow a little alsike with the sweet clover," Sperling has said. "I don't need it the first year, but I do the second, for I let the sweet clover run over. Then by August in the second season it is about passed out, but the alsike remains to finish that season. I don't hold the field, though, for the alsike alone. The next spring it goes into corn for silage."

In the first two or three years he had to buy alfalfa in the bale from Nebraska, but since then he has managed to raise a little himself, and to get more by putting it up on shares on neighboring farms.

Because he has a big power mill for grinding the grain, he runs his alfalfa hay through it, maintaining that it pays by making the roughage go farther in the ration, and by avoiding the waste of stems.

His formula for grain feeding is 600 pounds of corn and cob meal, 300 pounds of bran, and 100 pounds of cottonseed meal, giving about one pound of the mixture to about four pounds of milk. He feeds straight through the summer to keep the cows in good flesh and to maintain the regular flow of milk so that the milk route will not see a lack. There are times of abundant green feed that the cows refuse to eat much of the concentrate, but he gives what they will devour of it. If the pasture gets short, there are the patches of sweet corn for summer feeding, but Sperling plans to add another silo so silage can be used for summer ing when necessary.

There were lessons in indi cow production to be learned. ling thought that he could tel paying cow from the boarder co by watching the pail, but after he joined a cow testing assoc and discovered that he had guessing wrong in several Since then he has sold eight cow did not pay, although he had th by the old rule that they did. some that I believed were not as good as those eight, prove weight and test to be better," ex Sperling. He stood about third association when this was writt

You've got to raise high prod crops to feed high producing and be so careful with the mil the customers can find no fault the flavor. That spells success, ling has been showing.

Iowa. G. R. HARRIS

Better Sires Special

Making nine one-day stop Northern Indiana, a "better special" train will operate ove Erie Railroad, September 27 to ber 5, distributing four carloa superior sires of the leading breeds and demonstrating feeding and other dairy practic thousands of farmers.

Many agencies, local, state, a tional, will co-operate to mak tour a success. Besides the four of Holstein, Guernsey, Jersey, and Ayrshire bulls the train carry exhibit cars fitted by P University and the U. S. Depar of Agriculture, a flat car for ou talks and motion pictures, a bu car, lecture coaches, and a suppl

The daily program will devot morning to the inspection of bull exhibits with the dairy exper hand to explain and answer ques At 1:30 p. m. specialists from due, the breed associations, an Erie railroad will give talks on feeding and breeding, and the i tance of growing legumes. Im ately following this program including one or two sires, w given away. At 7:30 p. m. a ve teresting and instructive progra motion pictures on dairy topics be given.

The "better bull special," ope by the Erie railroad through N ern Indiana in 1924, has br about an increase in the numb pure-bred dairy animals, and a crease in milk and butterfat pr tion. More than 4,000 cows ha ready been bred to pure-bred placed by that train. To further ulate the dairy industry in the tory through which it passes purpose of this special.

The speakers and demonstrato the present tour will be: fo Erie Railroad: H. B. Rogers, agricultural agent, and T. M. Pa agricultural agent; for Purdue versity: E. A. Gannon, associa dairy extension, E. T. Wallace sistant in dairy extension, J. H. ton, association in dairying, Pence, associate in soils and cro tension, and K. E. Beeson, assi in soils and crops extension; fo Indiana Holstein-Friesian As tion: C. W. Newman, president the American Jersey Cattle Cl E. Dennison, fieldman; for the A icon Guernsey Cattle Club: Holden, field representative; fo Indiana Ayrshire Breeders' As tion: R. M. Gore, president, a A. Eby.

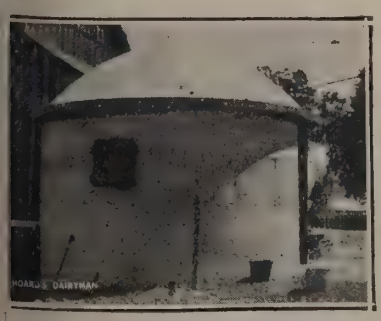
Aunt Ada's Axioms: Not things can hurt a child so much discourage his enthusiasm.

ld Dobbin Tramps Silage

HOARD'S DAIRYMAN:—As we were ving along the concrete road south Provo, Utah, one day last summer saw the figure of a horse outlined ainst the sky some distance ahead l to the right of us. At first we ught our eyes were deceiving us, ; as we got closer we saw that the se was tramping bean and pea e silage on top of the largest stack its kind that we had ever seen.

We recalled a story that we had d in our youth about some boys

ORSE TRAMPING PEA AND BEAN VINE SILAGE ON A STACK NEAR PROVO, UTAH



o had tramped the hay in their her's barn by driving three colts nd and round in the mow. All went l until the barn was full when the s discovered that there was no y to get the animals down. The ey was continued, and to this day have never learned what they did h those colts because our subscrip- n ran out and it was never re- ved. Perhaps that is why we pped to see how this horse would r get down from its high position. Ve found that the descent was easy ause the driver had built an in- ied plane of hay to the top as the k rose higher and higher. The se not only tramped the silage but hauled it away from the elevating te as well. Seven or eight viners e at work in the building below the depodded vines were dropped o an apron that deposited its load a single elevator. This elevator ried the silage to the top of the k, so it was made to do the work seven or eight, thus materially re- ing the power required to run the chinery. We were satisfied that idea was a good one and that the se would get down, so we started motor and went on our way.

Visconsin. GUY A. PETERSON.

Round Milk House

HOARD'S DAIRYMAN:—A very nice crete milk house has been erected past month by one of the mem- s of the Poynette Association of sconsin. This is circular in shape. s about ten feet across and about ht feet high to where the roof be- s its curve to a hole in the center. s will be filled in some time with upola.

A concrete milk cooling tank takes one-third of the interior floor ce; right outside at back in the nyard there is another tank made the same material but larger and

ONCRETE MILK HOUSE WITH BOTH INSIDE AND OUTSIDE COOLING TANKS

used for watering cattle. One feeds into the other. It certainly looks sanitary and to add to the cleanliness of what has always been a dirty and muddy barnyard, a concrete walk almost the width of a car has been laid from here to the cow stable, a matter of 35 or 40 feet. Instead of wading through mud between house and barn, a person can make the trip quite cleanly.

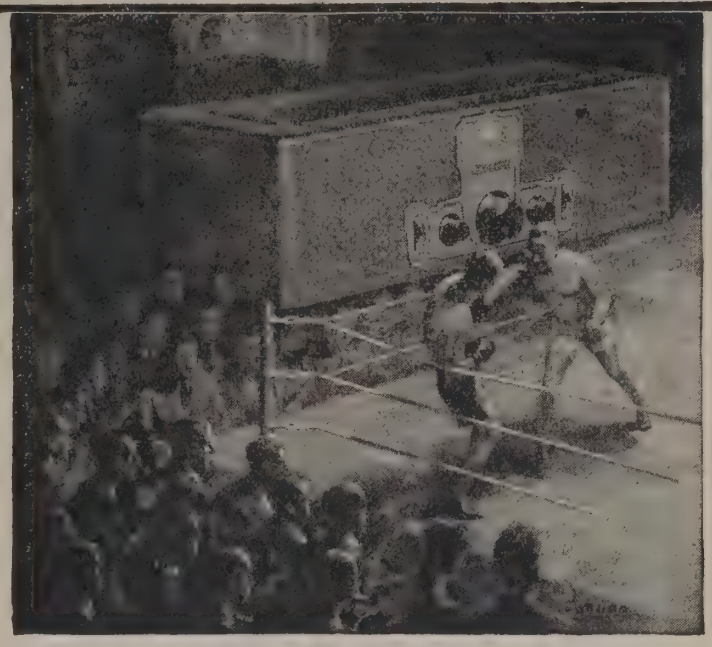
While working around my car, I could not help noticing the curiosity it creates from passersby who stop to investigate. W. ERIC CONSTABLE.

Nebraska Creamery Short Course

The Dairy Husbandry Department of Nebraska is offering a six months' course in the fundamentals of dairy practice, extending from October 10 to April 18. This course is intended for inexperienced men wishing to learn the dairy business. It is an elementary course covering buttermaking, cheesemaking, ice cream making, market milk and testing as well as some fundamentals in chemistry and bacteriology.

Students enrolling in this course should have completed the eighth grade or have had equivalent educational opportunities. Registration and incidental fees are approximately $10. Books, white suits, and rubber shoes will cost from $10 to $15 and board and room may be obtained near the campus for from $6 to $10 per week.

For further information address Professor H. P. Davis, Dairy Husbandry Department, University of Nebraska, Lincoln, Nebraska.



Railroad Rates to National Dairy Show

The railroads in the South are offering such splendid co-operation in the way of rates and service that every locality which has a dairy interest is expected to organize a party of farmers, dairymen, and business men who want to see the big exposition which is being held in the South for the first time. The special rate of a fare and one-half for the round trip from almost all parts of the country will draw many similar delegations which have not been reported.

Aunt Ada's Axioms: The way to teach children to accept responsibility is to give them responsibilities to accept.

~when the crown stands or falls....

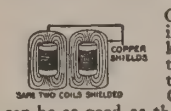
"—You're *there* with a Crosley..."

The Crosley Radio Corporation:
Folks who buy radio are vitally interested in what they get for their money. Why don't you radio manufacturers stop talking like a lot of doctors and tell us what it's all about in one cylinder words. What's this "shielding" business anyway?"
Yours truly,
A Crosley Dealer.

Shielding is necessary in a modern radio receiver. The more sensitive the set is, the more you need it. Some sets are merely housed

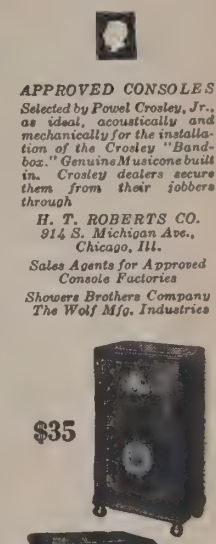
in a metal case. This helps to keep strong local signals from breaking through, but it is even more important to keep them where they belong after you get them the proper way from the antenna.

A set has tubes, condensers and coils. Here is a coil. The lines around it are the magnetic field. You know the earth's magnetic field will work a compass down in a mine, or up in a plane (it certainly worked for Lindbergh) and the fields around unshielded coils get all mixed up and the set howls and squeals and has to be choked off by turning down the filaments in the tubes.



Now if the coils are housed in copper shields the fields can't mess each other up, and the tubes can do a real job of amplifying. The coils in Crosley sets have these copper shields, and there isn't anything better.

Then there are the condensers and if it wasn't for the shield around them, the fields would act like those in the coils, and the results would be just as bad, or worse.



It isn't enough to shield the coils and the condensers, because even the wiring of the set has fields around it. This, too, is shielded, as it is in all really high grade sets.

Of course, it's all in knowing how to do it, but that's why Crosley sets can be as good as the best without costing half as much.

APPROVED CONSOLES
Selected by Powel Crosley, Jr., as ideal, acoustically and mechanically for the installation of the Crosley "Bandbox." Genuine Musicone built in. Crosley dealers secure them from their jobbers through

IMPROVED MUSICONES
Musicones improve the reception of any radio set. They are perfect affinities in beauty and reproductive effectiveness for Crosley Radios. A tilt-table model with brown mahogany finish stands 36 inches high. $27.50—16-inch Super-Musicone as pictured above with "Bandbox". $12.75—12-inch Ultra-Musicone, $9.75

The BANDBOX
A 6 Tube Receiver *of* unmatchable quality at $55

Many features of this set have been found heretofore only in the most expensive radio. Since Crosley is licensed to manufacture under nearly all important radio patents, this combination with Crosley leadership and experience, naturally produced an amazing radio, the remarkable value of which can be judged by the following features incorporated and by seeing it and hearing it at your dealers.

1. Completely shielded coils, condensers and wiring. 2. Acuminators for sharper tuning. 3. Completely balanced genuine neutrodyne. 4. Volume control. 5. Single tuning knob. 6. Illuminated dial. 7. Single cable outside connections. 8. Designed for easy installation in consoles. 9. Beautiful frosted brown crystalline finished cabinet.

AC model using new R.C.A. AC tubes and working directly from electric light socket through Crosley Power Converter is $65. Power Converter $60 extra.

Hear this wonderful new contribution to the enjoyment of radio. If you cannot find one of the 16,000 Crosley dealers near you, write Dept. 44. for his name and literature.

EDITORIAL COMMENT

NOW AND THEN

Major E. E. Critchfield, born and raised on a farm in Pennsylvania and a dairy farmer during his early years but later a leading business man of Chicago, writes us as follows:

"In a recent issue you quote butterfat at 50 cents per pound. Surely times have changed. In going through a volume of the "Cultivator" for March, 1838, I came upon the following item:

Jesse Bull—Sir: Below is a statement of the amount of butter and cheese made from my dairy of six cows in eight months of last season, which I think will do credit to the farming and dairy interest in this town:

1448 lbs. cheese which sold at my door at 7¼ cents	$104.98
452 lbs. cheese at 8 cents	36.16
415 lbs. butter at 18 cents	74.70
	$215.84

Making an average of $36.58 1-6 per each cow. Sir, will you please give the above insertion in your valuable "Cultivator" and you will much oblige yours. (Rev.) Ephriam Crocker.

This man was evidently proud of this record or he would not have requested its publication. As Major Critchfield says, "Surely times have changed."

SOIL AND LIVE STOCK

We have striking evidence that there is a direct relationship between the development of cattle and the fertility of the soil. When land is impoverished through years of cropping or when it lacks certain elements of fertility, it is often expressed in the physical condition of live stock fed upon the crops it produces.

In Northeastern Wisconsin there occurs among some herds of dairy cattle a disease called pica. A recent investigation discloses the fact that this disease is due to the lack of phosphorus in the soil. The plants grown on it, whether grass, hay, or grain, do not provide a sufficient quantity of this element to nourish dairy cows properly.

Investigations by the Wisconsin Experiment Station show that supplying phosphoric fertilizer to the land or phosphorus to the ration serves to prevent the trouble. Cattle grazing on pastures not reinforced with fertilizers should be given bran or should be provided with steamed bone meal.

Instances of this kind show conclusively that there is a direct relationship between the quality of the soil and the quality of live stock. In sections where the soil is incomplete in its fertility, it necessitates an understanding of what it lacks before stock raisers can hope to produce the finest kind of animals or to get the highest returns from them.

CURE FOR TUBERCULOSIS

Considerable publicity is being given to the cows recently treated with Dr. Kirkpatrick's so-called cure for bovine tuberculosis. An experiment was conducted in Oregon to determine whether or not this particular so-called cure for tuberculosis discovered by Dr. Kirkpatrick possessed any merit. The cows used in the experiment had responded to the tuberculin test and were considered tubercular. Several months after they were given the treatment they were slaughtered under federal supervision.

We wrote to Dr. J. R. Mohler, Chief of the Bureau of Animal Industry, concerning this experiment and he informs us that well-pronounced lesions of tuberculosis were found in five out of the seven animals slaughtered.

The Willamette Valley Medical Association has also, in substance, stated: "Many of our members witnessed the autopsies of these animals in Portland, August 6—10, 1927, and discovered no visible evidence indicating that the Kirkpatrick treatment actually effected a cure of any of these cattle under experiment."

It is hoped, of course, that some effective cure can be discovered for tuberculosis, but until some treatment has been thoroughly demonstrated to be a cure, laymen and live stock owners should place no confidence in it. Tuberculosis is too insidious and serious a disease to warrant any one to use a so-called cure unless it has been positively demonstrated to be a cure.

COLLEGIATE EDUCATION

Elsewhere in this issue will be found a communication commenting on our editorial entitled "Collegiate Eucation."

It was not our intention to convey the idea that an advanced education is not of value to a girl. We should aim to provide all the education that the girl or boy is able to use. No one possesses too much knowledge. The girl who takes advantage of a college course is stronger and better for it and can get more out of life. She can build a better home with less effort. This is due to the work which she did in college and to its training.

We must not lose sight of the fact that to develop a human being who is worth anything more than average, requires struggle. The kindness of parents leads them to the desire to fit their children for life's work without denying themselves of any pleasure and without expending long hours of toil. This amounts to almost a visionary hope, for few individuals can be developed unless they plan and work. The world demands men who find no task too difficult for them to tackle. To prepare for such duty requires, in a great majority of cases, students who do something more than receive money from home and get passing marks in college.

What we desired to emphasize in the editorial, pertaining to a broader education, is that we are sending too many boys and girls to college who have no particular object in view. Many who are sent to college simply drift through and get their diplomas. In a great number of such instances sending children to college injures them rather than helps them.

Our correspondent fell in love before she finnished high school. This is not at all unusual and she should not brood too much over the handicap of being very young and inexperienced when married. It is quite possible the training she has had in the college of experience has made her more capable than if she had gone to college. It is a false idea to think that college is the only place for young people to obtain useful and advanced training.

WISE ENOUGH

The purpose of Hoard's Dairyman is to give its readers accurate and useful information. This is not always appreciated; in fact, it is not always desired. In soliciting the subscription of a dairy farmer, we received this letter in reply:

"I am not interested in your paper for the reason that you are advocates of the tuberculin test. Whatever else your virtues may be matters little so long as the tuberculin test continues to do so much damage to the dairy industry with so little corresponding good either to the industry or the public health."

We took occasion to write this man, and in part said:

"We, of course, would like to have you as one of our readers, but we are more interested in the eradication of bovine tuberculosis than we are in securing a large circulation. We would not advocate the tuberculin test unless we knew it was an accurate diagnostic agent and it was to the benefit of the live stock owners to free their herds from tuberculosis. It seems to us that we are giving helpful information when we advise our readers as to the cost of this disease and outline plans to eradicate it. If you do not care to have accurate and useful information, you would not be interested in Hoard's Dairyman. It is not ou purpose to publish just pleasing material bu rather give information that will assist dairy farm ers to increase their incomes and improve the business."

We do believe the day is not far distant whe the consumer will demand all dairy products to b produced by cows free from tuberculosis, and seems we would be negligent in our duty if w failed to give information as to the best way fo the dairy farmers to proceed to clean up the herds.

Twenty-five or thirty years ago when the tu berculin test was not generally understood an the purpose of eradicating tuberculosis did no seem so important, a letter such as quoted abov might have been excusable. Today it is differen for millions of dairy cows have been tested, thou sands are upon the waiting list, and public opin ion is in favor of subduing tuberculosis. It seem strange that a dairy farmer would close his eye and shut himself away from information that of value to him.

DAIRYING AND OVER-PRODUCTION

In an address by Lloyd S. Tenney, Chief of th Bureau of Agricultural Economics, delivered a the Institute of Co-operation, he pointed out tha since the war several nations have materially in creased the production of dairy products. Severa of these nations are producing more than the consume. New Zealand, for example, has becom a large exporting nation of both butter and chees and produces milk at a exceptionally low cost, du to her equable climate and good pastures.

The question was raised by Mr. Tenney as t whether this increased production of dairy pro ucts would not sooner or later influence mater ally the prices of dairy products in this country It has been fortunate for the dairy industry th past few years that there has been an increase i the consumption of milk and that the farmers hav not increased production so that it is necessar to export any dairy products. The small quantit which is exported has little or no effect upon in fluencing the prices of dairy products consume at home. It is fortunate, too, for the dairy indus try that it has had leaders who have laid plans t take care of seasonable surplus and to secure tariff on dairy products which has given the in dustry real protection.

The dairy farmer must not be misled by th statement frequently made that agriculture has n protection, for his industry is well protected. I the tariff were to be lowered or we could becom a free trade nation, these nations that have a sur plus of dairy products would send them to us There is no question but what this would lower th prices of dairy products and to the disadvantag of the dairy farmer. So long as we maintain ou present tariff on dairy products, we do not loo forward to the surplus dairy products of the worl influencing our market to any large degree.

As we have many times pointed out, we are in creasing the production of dairy products to kee pace with the increased consumption and decreas ing the number of dairy cows. We have ove 600,000 less cows than on January 1, 1925, an over 3,000,000 more mouths to feed. This show that dairying is making genuine progress in tha it is increasing the efficiency of cows and increas ing the consumption of milk and its products.

The American dairy farmer should keep on im proving the production of his herd, eliminatin the low producing cows and urging his organiza tion to do more work in educating the consume concerning the food value of dairy products. H should also extend his organizations for marketin his products and for the taking care of seasonabl surpluses. If all these things can be done, w have little fear of foreign influence depressing th prices of dairy products to unprofitable levels.

Salting Hay and Silage

Is the salting of hay or silage beneficial, and es it increase their feeding value?
'Duluth, Minn. S. S. E.

We have never had any great faith in salt as aid in storing hay, but there is considerable nion to the contrary held by many farmers. would hesitate to advise the use of more than ounce of salt to ten pounds of hay, for if more t is used the cows would receive a larger ount than is generally considered desirable. is would mean that not more than ten to fifteen nds of salt per load of hay should be used. e salt may tend to prevent some fermentation l check the growth of mold, but we apprehend largest use is in rendering hay of mediocre ality somewhat more palatable. We do not sider salt of any advantage in ensiling corn I would not advocate its use. It will probably no harm but we are quite certain that it will no good.

Corn Stover Silage

n an investigation as to the digestibility of n stover silage when fed to beef cows, Profes- s Hamilton and Rusk of the Illinois Agricul- al Experiment Station report the following clusions:

. Apparently no considerable change in chemi- composition is brought about by ensiling corn ver.

. The availability to ruminants of the nutri- s in corn stover silage is practically the same as t of the nutrients in ordinary corn stover.

. There is about 85 per cent as much total estible nutrients in stover silage as there is in same weight of whole corn silage; however, erimental feeding trials at this station indicate t in practical feeding stover silage is only about -thirds as valuable as normal silage.

. The advantages of feeding stover silage over inary stover from the shock or pasturing in fields are (1) reduction of loss of material n exposure to rain and wind; (2) no loss from nping; (3) an increased palatability, causing a ater consumption and smaller waste in feeding to the fact that stalks have been softened, ken up, made juicy and palatable; (4) a much ater ultimate utilization of the nutrients of corn crop than when the stover is fed from shock or is pastured in the field.

Free Martins and Twins

s a free martin a heifer twinned with a bull? useful as a breeder? I am under the impres- that a very small per cent of them will breed ll.
uluth, Minn. S. S. E.

is unusual that a heifer twinned with a bull breed and she is ordinarily termed a freemar- A freemartin is a female in which the re- ductive organs have failed to develop properly this animal is not only sterile but tends to de- p many of the characteristics of a steer. In- igators tell us that this condition is due to the m with one another of the membranes which ound the male and the female twins. If these abranes join, the circulatory systems of these individuals also join. In consequence, the d of one is enabled to circulate through the y of the other. While the blood of the female does not seem in any way to interfere with normal development of the bull calf, yet the d of the latter circulating in the female's veins ns to have the effect of inhibiting its full ual development. When these twins separate irth, it is then too late for the organs of the ale to recover and develop normally, so she lops into an imperfectly sexed heifer and al- t invariably causes disappointment to the op- stic owner whe retains her in the hope that will prove a breeder.

ccasionally when a male and female are twins, female develops in a normal way. When this rs, it can only be attributed to the fact that union of the two membranes has not taken e or if it has occurred, this has only taken e at a late stage in the development. The fe- in this case is not a freemartin, as a free- in never proves to be a breeder. The evi- e thus far is that in the great majority of s in which twin calves are reported as being and female, the so-called female in reality freemartin and not a true female. It is rather ult for the ordinary observer to distinguish een a freemartin and a heifer at the time of birth, although the distinction will become more apparent with age.

Where both twins are females they will breed and twin bulls will breed, also a male twinned with a female will breed. It is so unusual that a so-called heifer twinned with the bull will breed that we consider it unwise to raise such an animal for the small chance that she may reproduce.

Roughening Concrete Floor

About a year ago I noticed in your columns a suggestion as to how to roughen a smooth, concrete barn floor. As the floor in our barn is washed daily, it has become so smooth that our stock is down on the floor daily. Any suggestions you may have to offer will be appreciated.
Chino, Calif. A. M. W.

Mr. W. G. Kaiser, of the Portland Cement Association, has given us the following reply to this inquiry:

"Perhaps the easiest solution of this problem is to etch the surface with muriatic or commercial hydrochloric acid. In doing this the muriatic acid is diluted with water in about the proportion of one part acid to five parts water. The acid is applied on the floor surface and allowed to remain until the desired amount of roughening occurs. Then the acid should be thoroughly washed off the surface to prevent further action. It may be necessary to apply the acid two or three times to get the surface etched to the desired depth.

"Another way to roughen the floor would be to use a pick point hammer or chisel. This is a rather slow method and entails considerable hard work."

Sampling Milk and Cream

What is the correct way of taking samples of milk and cream? In our co-operative a man may have from 2 to 4 ten-gallon cans. Should this be mixed before sampling? At the present time the same sized sample is taken from each can no matter how much milk is in the can. These samples are held for two weeks and then mixed and tested.
Farson, Wyo. J. E.

While technically the most accurate means of testing milk and cream is to make an individual test each day, this would represent a rather high cost and may not be practical. The composite sampling of milk is practical and will give you as good results as daily testing.

The purpose of taking composite samples is to reduce the labor and expense of testing, as under this system tests are made only once every week. The proper sample consists of proportional parts of the milk from each can and each day's delivery from the same patron. The sample jars in which these are placed must have a tight seal in order to prevent the evaporation of moisture as otherwise the sample will test higher than it should. Pint jars sealed with glass, rubber, or cork stoppers or metal caps may be used for this purpose. Bottles with paper caps or jelly glasses with tin lids do not furnish tight seals. A separate jar is used for each patron and should bear his proper number. The jars should be thoroughly cleaned and should be conveniently arranged on shelves near the weigh jar.

Direct composite samples may be obtained by the use of a milk thief or a graduated pipette which may be secured from any of the dairy supply houses that advertise in Hoard's Dairyman. The milk thief consists of a tube which, when inserted into the can, allows the milk to rise to the height in that can. If the cans are of the same size this will give a proportionate amount of milk from each can delivered daily, or if the cans are dumped into the weigh can then it may be taken directly from this. Another method of taking composite samples is the use of the small dipper holding about one ounce. If the weights of milk do not vary greatly from day to day this will give a practically reliable result.

Before the sample is taken the milk should be thoroughly stirred so that it will be of reasonably even composition throughout the entire can. In order to prevent the composite samples from souring it is necessary to add a small amount of preservative to the sample jar with the first sample taken. This is most conveniently done by adding a corrosive sublimate or bichromate of potassium tablet in each sample jar before the first sample is taken. During the hot weather it may be well to add two tablets. As each daily sample is added to the sample jar the contents of the jar should be gently shaken by giving the jar a rotary motion in order to insure a complete mixture of the preservative with the entire contents of the jar. When doing this, care should be exercised that the milk does not unnecessarily slobber up the side of the jar, as otherwise it will dry there and it is difficult to re-mix it when the test is made.

Another method that is frequently used is to sample each patron's milk every third, fourth, or fifth day. The patrons are divided into groups so that the tester will have the same amount of work to do each day but each patron's milk will be actually sampled and tested only 8 to 10 times a month. Tests of these samples are averaged at the end of the month. This method, according to tests conducted by Hunziker at Indiana, gave practically accurate results for the average test of the milk delivered during the month. This is explained upon the basis that the samples are taken directly and immediately tested, and the slight inaccuracy due to the composite sampling is done away with.

The correct sampling of cream is much more difficult than it is with milk. A slight error in the sampling will produce a much greater error in the resulting test. For this reason composite sampling of cream is not desirable and it would be preferable to follow the method of either daily testing or testing every third to fifth day. It must be remembered that special care must be used to stir the cream thoroughly so as to get a representative sample of the cream. Professor Hunziker gives the following suggestions as to sampling cream:

"After the cream is properly mixed, a small sample is taken by transferring the cream with a small cone-shaped or cup-shaped dipper into a small sample tube or jar, which is immediately tightly sealed. It is customary to place the dipper into a can containing hot water after each dip, so as to rinse it and facilitate the sliding of the thick cream of the next can into the sample jar. The use of a cold dipper would cause the cream to stick to it and thus delay the work of sampling. These cream sample dippers should have a small hole in their bottoms in order to facilitate rapid and complete escape of water when the dipper is removed from the hot water and before it is dipped into the cream. The sampling is best done while the cans are still on the floor and before they are placed on the scales, as the stirring jars the scales and shortens their life."

In the case cited where a member may have had two 10-gallon cans of milk and one 5-gallon can it would be well to take a full dipper of milk from each of the 10-gallon cans and a half dipper from the 5-gallon can; or, if this milk is dumped into a weigh can and mixed, a sample can be taken from this weigh can and will then require only one dipper of milk for the sample. While reasonably accurate results are secured by keeping the composite samples for two weeks, it would be better to make the test at weekly periods.

Rye for Silage

Would rye sown this fall and cut in June or when it is in blossom and put in silo make good feed for cows when you were short on summer feed? Would winter hairy vetch be good to mix with it? Any information in regard to this will be greatly appreciated.
North Baltimore, Ohio. W. E. D.

Rye when cut in the flower or early dough stage will make a fair to good grade of silage. The silage is liable to be rather strong smelling and is liable to taint the milk although this can be largely overcome by feeding the silage directly after milking rather than before. Care will also have to be exercised that the mangers are well cleaned out and the silo is cut off from the barn as otherwise the odor in the barn itself may be taken up by the milk during milking time. One investigation indicated that rye silage was about 10 per cent less valuable for milk production than was corn silage. It is, perhaps, not quite as palatable as corn silage and has not been largely used for silage.

Vetch may be combined with the rye and will make a good grade of silage. However, a better combination would be winter wheat and hairy vetch as this avoids some of the strong smelling silage resulting when rye is used. It is quite largely used in the western states for regular silage although there they generally use spring vetch. Hairy vetch would be preferable in cold climates and it is doubtful whether the the spring vetch would come on in time to provide summer silage. It is recommended that at least one bushel of wheat—some use a little more—and from one-half to one bushel of hairy vetch be sown per acre.

Compare the Tires and Compare the Prices

Fisk offers the greatest combination of quality tires and economy prices. Save money on every mile you ride with

FISK TIRES

Fisk Extra Heavy Balloon

The Super-tire for super-service. Famous for its extra comfort, extra safety and extra mileage. The greatest heavy duty balloon tire on the market.

The Low Priced Fisk Tire

Fisk Premier, of reliable quality, made in all sizes and types, balloon and high pressure.

"FISK SAYS IT WITH MILEAGE"

The 1927 Wisconsin State Fair

Continued from page 886)

and a little better length, so the two-year-old went up only to lose a moment later to the junior champion.

La Crosse, Monroe, and Manitowoc counties showed county herds that placed in the order named.

Senior and grand champion bull—Oxfonde Noble, owned by H. J. Trost; junior champion bull—Bessie's Fontaine's Duke, owned by W. S. Dixon. Senior and grand champion cow—Knight's Nellie Dear, owned by The Oaklands; junior champion cow—Majesty's Oxford Fairy Ann, owned by W. S. Dixon.

Brown Swiss

Judge—Professor G. C. Humphrey, Wisconsin.

Professor Humphrey had 71 Brown Swiss entries to pass on this year, 26 more than in 1926, and with his tops just about on a par with those of a year ago.

The only class with but a single entry, that for aged bulls, brought out the senior and grand champion, Meadow Green John, owned by W. A. Drollinger. He is a big, growthy 4-year-old, not too smooth a bull, but a good one that makes an acceptable champion.

N. C. Schmid had all the best of the female classes with six blue ribbons and both championships. His cow, Cinnamon's Maiden, an outstanding entry two years ago, was easily the best female shown.

Schmid entries sired by Vronicka's College Boy were good winners in the get of sire class as they have been at more than a few shows in the past.

Senior and grand champion bull — Meadow Green John, owned by W. A. Drollinger; junior champion bull—Bonnie's Butternut Jim, owned by Fred Reuter. Senior and grand champion cow—Cinnamon's Maiden; junior champion cow—Mary Lee of M. G., both owned by N. C. Schmid.

MEADOW GREEN JOHN, GRAND CHAMPION SWISS BULL
Owned by W. A. Drollinger, Wisconsin

Holsteins

Judge—R. E. Haeger, Illinois.

Wisconsin had a smaller Holstein show than usual this year; there were 325 entries by 99 exhibitors besides those in the calf clubs, and while the tops seemed to be up to the usual standard, we doubt if the average quality of the show, particularly in the aged classes, was quite as good.

Tritomia Pietertje Lad, owned by the Wisconsin School for the Blind, and first in his class at the last National Dairy Show, headed the aged bulls. He was hardly so good as Rudolph's winning three-year-old, and when it came to senior championship competition he in turn was beaten by King Homestead Piebe Lad, an outstanding two-year-old owned by J. D. McDonald. The latter made a first class senior and grand champion.

The aged cows were not easy to place. There were 31 entries, good cows without any single, flashy, outstanding top, and the rail birds had hard work deciding where to begin. When Judge Haeger finally lined them up Lynn River Sylvia Duchess owned by Carnation Farms was first and Lady Boeringhurst Pontiac from Pabst Farms a close second. Both cows were in milk, as were the first prize winners selected by Judge Haeger in all the senior female classes, and while this is a practice that cannot always be followed, it has much to commend it. We have had too many dry cows head the Holstein classes at important shows.

The Jefferson County Asylum showed the two outstanding junior females, junior and senior yearling daughters of Dutchland Creamelle Denver Prince and although the judge selected the latter for junior champion her stablemate would have done just about as well.

Pabst Farms headed the get of sire class with four head by Creator that were hard to beat, the second prize three-year-old bull, grand champion female, a third prize four-year-old heifer, and the winning two-year-old.

Nine counties were out with county herds,—Jefferson, Waukesha, La Crosse, Sheboygan, Walworth, Washington, Manitowoc, Dane, and Iowa. They placed in the order named.

Senior and grand champion bull—King Homestead Piebe Lad, owned by J. D. McDonald; junior champion bull—Nirvana Ormsby Lad, owned by E. C. Wipperman, L. Schreiber, and E. J. Beuchel. Senior and grand champion cow—Pabst Korndyke Cornflower 2d, owned by Pabst Farms; junior champion cow—Artis Madam Wayne Denver, owned by Jefferson County Asylum.

Guernseys

Judge—J. P. Eves, Iowa

The Guernsey show was smaller this year but it was nevertheless the best quality show of the fair, with a particularly good lot of senior females. Larsen's Fern Dell Farms took home all the championship ribbons but it was not easy work for them at any time and on more than one of the classes competition was so close that the judge had to take more time than the size of the class seemed to warrant.

The female classes brought out the hardest competition and none of them were more difficult to settle than the aged cows or the senior championship. Imp. Country Flower of Langwater, a big stretchy cow owned by the Wm. Larsen Canning Co. of Wisconsin, and Imp. Kitchener's Irene, a corking big, little cow from Mrs. Chauncey McCormick's Illinois, herd seemed to be the two outstanding entries and it was quite some time before they were placed. The former has almost a perfect top and shoulder but she didn't have the bottom of the other cow and even when Judge Eves gave the stretchy cow the advantage, there were those at the ring side who would have reversed them.

Mrs. McCormick's three-year-old was quite as good as her aged entry better perhaps because she had more stretch, and in the race for senior championship it was very evidently between this heifer and the aged cow. The heifer had a better udder and much better veins but she didn't have the top and was noticeably lower at the pins than the 10-year-old and in the end the old cow won both senior and grand championship honors.

The get of sire class was another close one with gets by Ladysmith's Cherub and Meadowbrook's Dann Duff, the contenders for first. Mr. Tenney's foursome, first prize winners including a 3-year-old and a yearling bull, with a 4-year-old and 2-year-old heifer, had a maturity advantage over the four juniors owned by Larsen's Fern Dell Farms. The youngsters were the smoother, however, and the blue ribbon went their way.

A check-up on the winners shows that Larsen's Fern Dell herd won 11 blues, Shorewood Farms had 6, Mr. McCormick 2, L. P. Martiny 1, and M. A. Seybold & sons 1.

The state association has urged more county entries for the state fair and will undoubtedly succeed in getting out more county groups another year. They had three out this year, Waukesha, Jefferson, and Manitowoc that lined up as named.

Senior and grand champion bull—Border King of Roberts; junior champion bull—Lebeau Petit de Fern Dell, both owned by Wm. Larsen Canning Co. Senior and grand champion cow—Imp. County Flower of Langwater; junior champion cow—Myrtilla of Fern Dell, both owned by Wm. Larsen Canning Co.

Ayrshires

Judge—James Linn, Kansas.

The Wisconsin Ayrshire show was not up to standard this year, and certainly wasn't so good as it should be to fairly represent the state's red and whites. There were only 50 head shown by two exhibitors, Aldebaran Farms and Adam Seitz & Sons. These, together with two calf club entries, made up the show.

Seitz took all the blues, winning grand champion female on their cow Cavalier's Celia Pender, and grand champion bull on the 7-year-old Cavalier's Ping Pong. The old bull doesn't look quite as smooth as he did a year ago but he is still a real contender. He has campaigned every year since he was a junior calf and has won upwards of $4,000 in prize money for his owners, which we think certainly ranks him head and shoulders above any other bull that has followed the shows. Cavalier's Lady Lola was junior champion cow and Cavalier's Admiration was junior champion bull.

CAVALIER'S CELIA PENDER, GRAND CHAMPION AYRSHIRE COW
Owned by Adam Seitz & Sons, Wisconsin

oducers Trade-mark Milk

'he Twin City Milk Producers' As- ation has just completed an ar- gement whereby the dealers to m they sell their product will dis- the trade-mark emblem of the ciation on all of their 454 milk very wagons. They have also

Trade-mark of the Milk Producers' As- iation of St. Paul and Minneapolis that to be used in connection with an ad- rtising campaign.

'ked out an advertising program h these dealers on a 50—50 basis reby display boards will be scat- d throughout the city emphasiz- this trade-mark. Newspaper ad- tising will also be carried on upon same basis, the first newspaper ertisement reading as follows:

'Announcing a new plan to insure quality of our most important ds! From now on, look for this blem (cut of emblem) on the wag- your milkman drives. It is the blem of the Twin City Milk Pro- ers' Association, 7,000 dairy mers who live near the Twin Cit-

'These 7,000 dairy farmers do not ply milk and cream direct to nes or stores. They do furnish e, fresh dairy products to most of city's modern, reliable dairies.

g and Attractive Exhibits for Dairy Farmers

airymen attending the National ry Exposition at Memphis, Tenn., ch is being held from October 15 22, inclusive, will have an oppor- ity to view the last word in farm elopments all the way down the . The exposition is being held this r in conjunction with the Tri- te Fair which, for years, has been of the South's foremost agricul- al shows. The Tri-State Fair par- pates in the $85,000 appropriation le by the Tennessee legislature for m improvement at its last session. e prizes this year will total nearly 0,000 at Memphis.

wine, chickens, pigeons, and horse plays at the Tri-State Fair are l to be second to none in the South. e National Dairy Exposition's dai- equipment display will be housed a modern building which is longer n a city block. This building was ted solely for the exposition but be a permanent feature of the -State Fair, according to Frank D. ler, general manager. The Dairy Exposition will occupy three build- ings in addition to the great display structure.

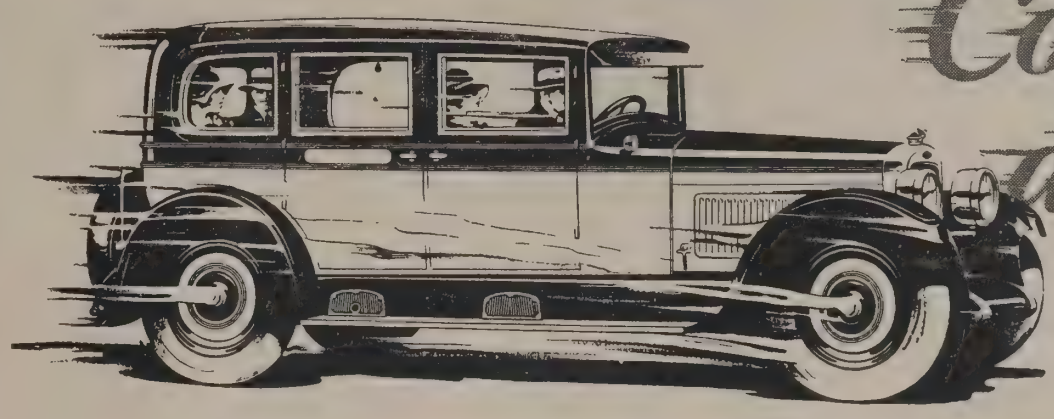
The attendance at this year's expo- sition is expected to be more than 300,000.

More Production Records Needed

Last spring a county agent in In- diana drove to a county in Wisconsin in search of calf club calves. He wanted calves from cow testing asso- ciation dams whose records were from 300 to 400 lbs. fat, depending on age. He was disappointed. He likely will not go back. Why?

The county in which he had a right to expect to find the kind of calves he wanted, while boasting of some 60,000 dairy cattle and two county breed associations, has only one cow testing association.

The secretary of one breed associa- tion made every effort to please the prospective buyer and showed him calves that met every requirement but one—that of production records of their dams.



Earlier in the season a buyer from a western state came to the same county to buy 100 heifers whose dams had reasonably good cow test- ing association records. Of course he could not find what he wanted. He went away and likely will not return.

These buyers represent a trend in the exchange of dairy cattle. The number of herds in testing associa- tions is wholly inadequate to meet the demand. The greatest need in dairying today is more records for the purpose of finding the unfit cows as also those worthy to be the an- cestors of herd replacements. More cows should be standardized by pro- duction records in order that those who go out looking for cattle may not only find what they want but also have confidence that they will get what they pay for.

NASH
Leads the World in Motor Car Value

3 New Series—*All SIXES*—New Lower Prices

From $865 Upwards
f. o. b. factory

Come drive

The **Finest, Fastest**
cars in all Nash history

Greater *SPEED* than ever before is a keynote characteristic of the new Nash models.

They are finer, *FASTER* cars than any Nash has ever developed.

Nash has worked wonders in turning the phenomenal possibilities of the 7-bearing motor into realities.

Just drive one of these new Nash models. Their lightning-like pick-up, their amazing speed and their unequaled smoothness will give you a distinct new motoring thrill.

And they're the *EASIEST* riding cars you ever traveled in.

Each model is equipped with the new Nash secret process alloy steel springs.

These new springs are individually engineered to each model—tailored scientifically to the weight and size of the car.

Even the Standard Six Series—priced down to the 4-cylinder field—have these remarkable springs.

There are 21 new Nash models for you to inspect. They offer new beauties in body design and rich new color harmonies in finish.

By all means see them at once. At the new lower prices Nash has established they offer motor car quality and value without a parallel.

Before you buy any car—*DRIVE* one of the new Nash models.

The Effect of Line in Dressing

"What do you think it was that almost broke off our engagement?" asked one of the most happily married men I have ever known.

Of course we guessed that his wife had laughed or shown a sense of humor at the wrong moment; that she had some time displayed a temper; that she had refused to leave her mother, and so on.

"Nothing of the sort," replied the man. "It was her hair and her hats. Of course you know what I think of Ethel, but all the same she has a long pointed chin and she used to wear her hair in a knot on top of her head at the back so that there just seemed to be a long line from chin to top-knot that gave her a strong-minded look that was entirely unfair to her disposition and emphasized her chin strongly. Whenever she bought a hat she always got one that had the trimming in the same position as her knot of hair.

"One day I ventured to suggest a change. You know I always adored her from the first time I saw her and I suppose I was only trying to make her more perfect. Well, she was furious at me and the result was such a quarrel that we almost parted. But she got to thinking it over and the result was—well, it's a long story, but would you ever notice now that her chin is especially long? It's all because she wears her hair low on the back of her neck and buys hats that are either entirely untrimmed or else have the trimming at the side."

This man is as far as possible from the nagging husband who fusses about everything his wife does and wears but he happens to be very sensitive to artistic effects and his wife has him to thank that she is now an extremely smart looking woman.

The smallest alteration of line in costume can make the most amazing difference in a woman's appearance. Take, for instance, a picture of a smiling, happy face. Get a fine pen and add a tiny line between the brows—a line hardly bigger than a dot—and see what happens. The smile is now counterbalanced by the frown and the whole happy expression is gone. In the same way similar good effects in dressing may be lost.

If the lines of your face are downward, mouth drooping at the corners, and so on, don't wear a hat with a drooping brim; wear either a straight one or one that turns up. Also if your nose turns up more than it should, don't wear a hat turned up in front; it only accentuates the effect of the nose.

Every stout woman in these days of thin styles is trying to make herself look as slender as possible and much can be accomplished by her if she will pay attention to the line of her clothing. The little, round shallow hats are not for her but then they are not fashionable now and she has a wealth to choose from in hats that are deep of crown and more angular in appearance. This type of woman can wear the V-shaped necks to advantage and also the new square ones. An upturned brim seems to give a slenderizing effect as does also center trimming on a hat.

In all clothes buying I think there is no more important warning to heed than that of buying nothing that has not been tried on in a good light in front of a full length mirror; it helps immeasurably in getting the right line effect to go with your particular style and figure.—LUCY THOMPSON.

The Sunday Outing

I once attended a service in the church Mr. Roosevelt used to attend when he was president of the United States and I was reminded of a story I had heard in connection with his habit of regular church attendance.

A man once asked him rather sneeringly why it was he always went to church on Sunday. His reply was that he needed the benefits he got from the worship.

"Well," retorted the questioner, "I go out in my car on Sunday and do my worshipping of God in God's own out of doors."

"Nobody would ever suspect," replied Mr. Roosevelt quietly, "that that was your motive."

And so it is with many others. They say they take their Sunday outings away from church in order to worship God in His own out of doors and yet, follow most any of them, you would have a hard time to believe that such had been the motive. With many it is a means of escape from the truth that they cannot remain quietly at home in enjoyment because they have never learned to entertain themselves; others want to "see how fast the old bus will go now that she has been overhauled" and they set out in a cloud of dust to pass everything on the road; others work hours to prepare a picnic dinner which is eaten in 30 minutes and whose littered remains are left as a reminder of how little they care for wayside beauty; while still others leave this ugly reminder in the form of uprooted wild flowers whose supply is every year becoming less.

Of course these are extreme cases but they are all too common and in spite of the benefits we receive from the automobile I cannot help feeling that it has taken away from us a good many valuable things, one of them being the quiet of a contemplative hour at church.

"I'm not religious," said a man to me once, "but I can't do without going to church. Nowhere else is there the atmosphere that enables me to lose myself in contemplation of eternal things and I always come away uplifted and helped."

It is right to enjoy Sunday. The day was made for rest, and rest means relaxation and enjoyment and change but while we are planning our Sunday excursions may we not at the same time give a thought to whether we might not attend church or Sunday School before starting and another thought to leaving nature at least as beautiful as we found it? City people are far the worst offenders along these lines but not all country people are blameless, either.—LUCY THOMPSON.

Seven Sins of Parents

A man in New York, Angelo Patri, has made himself famous all over this country for his wise and sympathetic study of children. He does not advocate giving in to a child and spoiling him by soft and flabby ways but he does believe that every parent should make it his first concern to understand his child and give him the training his individual nature demands. Here are what he calls the seven sins of parents:

1. Snubbing children. Nature has endowed children with an insatiable curiosity. It is through this curiosity that their minds develop. A great many children are met with scolding; are snubbed and put off.

"Daisy Dell" All Wool Felt Hats

These are the most wonderful hats in their class that have ever been placed before the women of this country. When finished, they have all the style and smartness of an importation direct from the Paris Boulevards.

The hats come flat, stamped on finest quality all wool felt, in the most popular millinery shades of the day and are correctly styled from every standpoint. Everything furnished except embroidery silk, as the colors for the finished hat are at the discretion of the purchaser.

Can be completely made up in less than an hour's time and their low price makes it possible for every woman to have a "chic and becoming" hat to match each of her costumes.

4891 comes in rose with hickory ornamentation.

4892 comes in Castilian red with black ornamentation.

4893 comes in Copenhagen blue with hickory ornamentation.

4894 comes in white with Castilian ornamentation.

4895 comes in monkey skin with rose ornamentation.

4896 comes in black with white ornamentation.

These hats are packed flat in special glassine envelopes to insure safe delivery.

Price of hats is only $1.25 each, postpaid to any address, delivery guaranteed. Prompt attention will be given all orders. Send to Embroidery Department, Hoard's Dairyman, Fort Atkinson, Wis.

Miscellaneous Fashions

No. 865—Dashing Two-Piece Type. Pattern cuts in sizes 16, 18, 20 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 3¼ yards of 40-inch material with ½ yd of 36-inch contrasting.

No. 872—Trim and Slender. Pattern can be had in sizes 16, 18, 20 years, 36, 38, 40, 42 inches bust measure. Size 36 requires 2 yards of 40-inch material.

No. 3138—Dashing Junior Frock. Pattern comes in sizes 6, 8, 10, 12, and 14 years. Size 8 requires 1¾ yard of 40-inch material with ⅜ yard of 27-inch contrasting and ¾ yard of 36-inch lining.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

Flowers Grow at Needle's Point

Who can resist the daintiness that a cheery touch of embroidery expresses? And with her dle, woman has no better opportunity to exercise her own conception of color combinations n in these newest of stamped patterns.

he feature of these six attractive designs is that you can have dainty appointments that ch, both for your bed, dresser and chifferobe, for these designs come made up in pillow- s and scarfs.

esign 3771 is most effective finished in shades of lavender and yellow flowers with shaded n stems and leaves, with baskets of yellow.

esign 3772 is individual if worked up in two shades of blue, with yellow and white flow- t centers.

esign 3773 worked up in shades of lavender, yellow and green, is exceptionaly pretty in ooms that have a tint of lavender in the decoration.

Design 3774 is done in orange, lavender, and green, it is most unusual.

esign 3775 is lovely when finished in shades of blue and pink flowers, with the colonial dressed in light and dark shades of yellow.

ades of pink, rose, and yellow make an unusual combination for Design 3776.

he pillow cases in any of these designs come in sizes forty-two inches at $1.45 a pair, forty-five inches at $1.50 a pair. Scarfs to match any of the pillow cases can be obtained izes eighteen by forty-five, price sixty-five cents each. Both pillow cases and scarfs are aped on the finest quality white linen finished material. A detail working chart showing uggested color scheme is enclosed with each design. Send to Embroidery Dept., Hoard's yman, Fort Atkinson, Wisconsin.

result is that when a boy leaves h school, at a time when his initi- e should be in full swing, he is , listless, dependent, and fearful.

Neglecting to study the child. parent decides what his son ht to be and proceeds to train him rdingly. They would make an- r child instead of accepting the they have.

Failure to realize that childhood distinct phase of growth. Fre- tly in an effort to give a child piness a parent brings disaster n him by forcing him ahead of his years. A child is not a little man. He is potentially a man and must be allowed to develop rythmically and in order.

4. Robbing a child of his leisure. A boy is lying on his back watching the clouds. His mother sees him and her conscience smites her. "He is wasting his time. I ought to make him go in and study his algebra. Last month he got a bad mark." He needs his extra time for cultivating his imagination. School hours are long enough. Study can be confined to them.

5. Nagging. "You are the size of your father and you act like a baby," says one parent. This was because the lad cried unexpectedly. "You great lumbering calf—why don't you look where you are going." The boy had tripped over the spindle-legged furniture in his aunt's tea room. One must be very gentle and patient in correcting the young. Hold your temper while he finds his legs and arms.

6. Exploiting the child for the parents' gain. This is as varied and widespread as the population of the world. It is practiced by the rich and the poor, the intelligent and the stupid.

7. Lying to children. "If you do that the bogey-man will get you." The child will soon know that this is not true, but the harm has been done. He has learned to fear and to doubt. —LUCY THOMPSON.

He was buying spring lawn and garden equipment, and had asked to see nearly everything in the store.

"Are you sure that is all the hose you have?" he questioned, finally, voicing his extreme disappointment.

"Yes, sir," the clerk answered, "except the pair I have on."—Good Hardware.

Send for Our Fall and Winter Fashion Magazine

You simply must have a copy of our Fall and Winter Fashion Magazine, for it contains too many good things for you to miss. All the new fall and early winter styles of course, and then there are pages of novelties for the masquerade. Articles about health and beauty and reducing safely, and pages showing correct hats, fancy needle work, special lingerie, etc.

While you have the matter in mind send 10c for your copy to our Fashion Department, Ft. Atkinson, Wis.

Quickly prepared for painting

—another Eagle economy

BY THIS new quick method of preparing Eagle Pure White Lead your painter can break up 100 pounds of Eagle to paint consistency in less than ten minutes — making Eagle Pure White Lead Paint the easiest paint to prepare for the brush.

Two factors make this economy possible — the unique design of the Eagle keg, and the smooth uniform consistency of Eagle White Lead.

The tough elasticity of Eagle, its great protective power, and now this new quick break-up —these advantages make Eagle Pure White Lead paint the choice of careful farmers everywhere.

Write today for free folder which describes this new Eagle time-saver. *The Eagle-Picher Lead Company, 134 North La Salle Street, Chicago.*

DAIRY MARKET NEWS

Wisconsin August Condensery Prices

Forty-nine condenseries reported to the Wisconsin Department of Markets the prices paid in August per hundred pounds milk delivered at their factories. Reduced to a common 3.5 per cent test basis, these prices ranged from $1.86 to $2.50, the average being $2.06.

Sixteen factories sent delayed reports for July, the average being $2.05. This is 10c above the previously reported average of $1.95 for 49 factories.

August Butter

Butter averaged 41.9 cents in New York for August, a slight increase over July and over August of last year but is a cent and a half under August of 1925. The first two weeks of September saw butter hold fairly steady at 44½ cents.

Storage holdings of butter during August showed an increase despite a continued heavy production of condensed milk and firm cheese markets at prices in excess of those prevailing for the same month since 1919. "There are only two explanations," says the government report, "for the piling up of butter stocks—either consumption has been inadequate or the members of the butter trade feel that crop and feed prospects indicate a decreased production this fall and winter and that a large reserve is necessary, and hence, profitable. It is apparent, however, that the latter belief is the ruling one, else prices would seek lower levels for additional consumption.

Creamery butter production for the first seven months of the year was 930,858,000 lbs., an increase of 11½ million pounds over last year. Net imports were 4,248,000 lbs., an increase of nearly four million pounds over last year. Storage holdings on August 1 were 145,146,000 lbs., an increase of nearly 14 million pounds over last year. This brings the estimated trade output to 1,192,947,000 lbs., a decrease of 27½ million pounds or 2 per cent less consumption than last year.

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices on 92-score butter (extras) at four of the principal markets, together with receipts and storages:

	Aug. 1927	July 1927	Aug. 1926
	lbs.	lbs.	lbs.
Chicago	41.5	40.	40.1
New York	41.9	41.7	41.8
Boston	42.1	41.8	41.9
Philadelphia	42.9	42.6	42.8
*Receipts for month	53,302	68,645	47,673
*Receipts since Jan. 1	423,492	370,189	411,380
*Storage (End of month)	75,090	66,783	73,149

*In thousand of pounds at the four markets (i. e.—000 omitted.) Ninety score butter averaged 39.2 cents for August in Chicago, with centralized butter at this market selling for 39.0 cents. Jobbers' prices on extras sold to retailers averaged 44 cents in Chicago, a spread of 2.5 cents above wholesale.

August Cheese

The wholesale price of cheese on the Wisconsin boards averaged 24 cents in August, an increase of a cent and a half over July and three cents over August of a year ago. Despite the relatively higher prices that have prevailed this year, cheese production has been somewhat under that of a year ago.

Cheese production for the first seven months of the year totaled 264,096,000 lbs., a decrease of nine million pounds from last year. Net imports were 44,206,000 lbs., an increase of 13 million pounds over last year. Storage holdings of American cheese are 6½ million pounds less than last year, with other cheese types 4½ million pounds greater. This brings the total estimated trade output to 282,453,000 lbs., a decrease of 14½ million pounds, or four per cent less consumption than last year.

Daily quotation from the U. S. Department of Agriculture show the following average wholesale prices for American cheese on the Wisconsin Primary Market during August:

	Aug. 1927	July 1927	Aug. 1926
	lbs.	lbs.	lbs.
Twins	23.3	22.	19.8
Single Daisies	24.0	22.4	20.9
Longhorns	24.5	22.3	20.9
Square Prints	24.7	23.9	21.5
*Receipts since Jan. 1	140,668	120,178	130,150
*Receipts for month	20,489	23,221	19,186
*Storage end of month	14,679	14,374	23,614

*In thousands of pounds at Chicago, New York, Boston, and Philadelphia (i. e—000 omitted.)

Wisconsin July Butter

Wisconsin co-operative creameries paid producers a net price of 45.2 cents a pound for butterfat in July according to reports from 74 of these creameries to the Wisconsin Department of Markets. These creameries received an average of 39.3 cents a pound for butter, making spread of 5.9 cents between the price received for butter and the price paid for fat.

The range in prices paid for fat was from 40 to 48 cents, with the price received for butter ranging from 37.2 to 41.1 cents. The overrun ranged from 20.0 to 23.4 per cent. Receipts of butterfat averaged 35,444 pounds per creamery.

The August price of butter on the New York market averaged 41.9 cents, practically the same as July and of August last year but a cent and a half under August of 1925. The first two weeks of September saw advancing prices, but as this is written it is doubtful whether September of last year will be exceeded or September of 1925 equalled.

August Foreign Butter

The following table of foreign butter prices gives the average of weekly quotations as published by the U. S. Dept. of Agriculture:

Market	Aug. 1927	July 1927	Aug. 1926
	Cts.	Cts.	Cts.
New York	41.9	41.7	41.8
Chicago	41.5	40.0	40.1
Copenhagen	35.0	32.1	35.7
Berlin	37.1	33.1	36.1
London:			
Danish	37.7	34.9	38.2
Dutch*	36.3	34.1	34.5
New Zealand	36.8	34.7	37.2
Australian	36.3	34.5	36.5
Argentine*	34.8	34.9	33.0
Siberian	31.4	33.9	30.4

*Unsalted.

Milwaukee August Milk

The Milwaukee Co-operative Milk Producers announce the following prices for the month of August:

For the portion sold as fluid milk, $2.90 per cwt.; and for the portion manufactured, $1.76 per cwt. These prices apply to 3.5 per cent milk delivered f. o. b. city, four cents being added or subtracted for each one-tenth of one per cent variation in test. Seventy-nine per cent of the total receipts were sold as fluid.

August Dry Milk

(From Report by U. S. Department of Agr.)

The wholesale prices given below are based on reports from manufacturers governing actual sales F. O. B. factory during July.

Dry Skimmilk: Prices ranged from 7 cents to 12 cents for dry skimmilk in bulk, averaging 9.12 cents a pound for sales, totaling 7,760,484 lbs. When packed in one-pound cans the price reported was 34.5 cents pound.

Dry Whole Milk: Prices ranged from cents to 28.5 cents for dry whole milk, aver ing 26.25 cents for sales totaling 216,856 l When packed in one-pound cans the price ported was 46.7 cents a pound.

Dry Buttermilk: Prices ranged from cents to 10.5 cents for dry buttermilk in bu averaging 8.28 cents a pound for sales tot ing 2,160,965 lbs. When packed in one-pou cans the price reported was 9.81 cents pound.

August Condensed Milk

(Report by U. S. Department of Agricultu

Prices paid producers for 3.5 per cent m f. o. b. factory were as follows for Augu covering those factories manufacturing b case and bulk goods:

Geographic Section	Price per cwt Range	Aver
New England	$1.97	$1.9
Middle Atlantic*	2.12—2.40	2.2
E. No. Central	1.88—2.40	2.0
W. No. Central	1.75—2.03	1.8
North Western	1.75—1.80	1.7
South Western	1.75—2.05	1.8
United States	1.75—2.40	2.0

*Fifty-nine additional factories repor prices based in part on current month's wh sale butter quotation. Twenty-three facto reported prices not determined as yet and reported factories closed.

Manufacturers' wholesale selling prices sweetened condensed and unsweetened ev orated milk were as follows for August:

	Range	Aver
Condensed, per case	$5.26—$6.65	$6.1
Condensed, per cwt.	9.25—13.00	10.2
Evaporated, per case	3.57— 5.20	4.5
Evaporated, per cwt.	6.58— 9.50	8.4
Condensed skim, per cwt.	4.55— 7.75	5.7
Evaporated skim, per cwt.	2.50— 6.45	3.6

Philadelphia Milk Prices

The Inter-State Milk Producers' Asso tion announces that the September basic p for milk will be $3.29 F. O. B. Philadel and $2.71 per hundred at receiving station 51—60 mile zone.

The August surplus price was $2.14 F. O Philadelphia. The August surplus price at receiving stations on railroad was $1.57.

These are based on milk testing 3 per butterfat with a differential of 2 cents each half point of test up and down.

Feed Market Situation

(By Grain, Hay, and Feed Market News S ice U. S. Bureau of Agricultural Economi

September 7—Weakness in feed grain m kets, together with an increased output wheat feeds, caused lower prices for hom feed and most wheat feeds late in August early in September, but gluten feed quotat were advanced, while most other feed s ruled steady to firm. Warmer weather in corn belt, together with the increased ma offerings of corn, was largely responsible a decline of about 12c in the corn mar during the past two weeks while oats around 2½c lower in spite of private re claiming disappointing threshing retu These lower prices of feed grains made bu cautious about anticipating their needs trading recently has been of small volume though relatively low stocks in many sect have helped to maintain a steady volum small inquiries.

Production of wheat feeds has show sharp up-turn recently, according to t reports and weekly figures on flour out-pu milling centers, while the out-put is expe to show a further increase since the den for flour has improved at the lower le of wheat prices. Mills were anxious to sales but storage stocks are unusually s at the present time according to trade ports and a number of dealers have bo on each decline. Bran prices in general about $1.50 lower than two years ago, v shorts and middlings range from 50c to $ lower with most points about $2.00 lower the period.

Linseed meal averaged fairly steady. mand slackened at Buffalo where prices fractionally lower. Crushers there were ious to make sales but production conti light and they were endeavoring to mai current quotations. The output at Chi was just about equal to current demand prices there showed $1 advance, but in Northwest buyers are holding off in anti tion of increased production of meal new crop seed.

Gluten feed prices were advanced in of the weakness of most other feeds. T reports suggested that production of this would be restricted since manufacturers n not be able to advance the price of product to off-set sufficiently the high of corn.

Cottonseed meal continued to advance l ly because of the prospects for a much sm cotton crop than was secured last year. T ing, however, was of limited volume with

ews from Washington, D. C.

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, D. C., Sept. 13—The rpretation of one of the provis of the income tax law, which ides that the corporation income does not apply to the co-operas is the subject of a controversy at this time, which is of some rest to the local co-operatives op- ing in the butter and cheese in- ries. This provision of the law been interpreted to apply only to e co-operatives all of whose kholders are bonafide producers patrons of the factory, not to e in which a part of the stock is ed as a matter of investment by iness men, or others in the com- nity, or elsewhere, who do not pa- ize the factory.

epresentatives of certain co-op- ives, in which stock is held joint- by farmers and milk producers, bankers and business men, who sted in order to supply necessary ital, are asking for a different in- rpretation. Several of the Minne- and Wisconsin Congressmen e joined in the request for the e liberal interpretation.

⚜

he Tuberculosis Eradication Di- on of the Bureau of Animal In- try has just issued a brief sum- y of changes in state laws passed ing recent legislative sessions con- ning either appropriations for T. work, or the legal provisions gov- ng the eradication of this disease attle.

o far as the figures show, and as- ing that when an appropriation is le for two years, one-half is to set aside for each year, the fig- s reported by the B. A. I. show over $7,120,000 is now appro- ted for use in 1927—28 to pay mnity for cattle slaughtered in T. B. campaign, while practically ry state has an ample fund for inistering the laws, and in addi- to this stupendous sum, there are ivided appropriations reported of rly $4,000,000 more. In other ds, the total for the next fiscal r from state sources alone, for n indemnity and administrations amounted to a total of about ren and a half million dollars.

Before long the Bureau will have details of these appropriations l worked out to be ready to pre- t to Congress.

⚜

nother feature of Canadian trade be investigated by the U. S. Tar- Commission, following the recent ition of hay growers in New York an increase in the rates of duty that commodity. Congressman ber of New York, joint author of Canadian Milk and Cream Import , has interested himself in the hay ff, and has urged the Tariff Com- sion to make the investigation. A el feature of this case is that ry interests in Northern New Eng- d are protesting against any in- ase, saying that they are depen- dent on Canadian hay because of their limited crop, and their distance from available surplus domestic hay.

⚜

The Tariff Commission will resume active work on September 17, the members who have been absent on either vacation or official travel are expected back by that time. One of the first cases to be forwarded to public hearing and final decision will be the Milk and Cream Tariff case, started last year.

⚜

With the appointment of Dr. Henry G. Knight of West Virginia as Chief of the new Bureau of Chemistry and Soils, the separation of the regulatory work heretofore in the Bureau of Chemistry from that Bureau, and the reorganization of both regulatory and research activities of a chemical character in the department is completed. Dr. Brown who formerly headed all of this work as Chief of the old Bureau of Chemistry remains as Dr. Knight's associate chief. Under the change all regulatory work, heretofore under this Bureau, including especially pure food work, drug and patent medicine inspection, as well as the fungicide and insecticide inspection work, all go to a Food, Drug, and Insecticide Administration, directly under Walter G. Campbell, Director of Regulatory Work. The research work of the Bureau of Chemistry was then combined with the Bureau of Soils, and the Fixed Nitrogen Laboratory work, and named the Bureau of Chemistry and Soils. The dairy industry finds its regulatory work—except the inspection of renovated butter factories—now all combined under the new Food, Drug, and Insecticide Administration. Dr. Dunlap and his associates who have had charge remain in charge but in the new environment. The change places Walter G. Campbell, head of the Regulatory work, much closer to the butter regulatory work than formerly. It also frees the research workers from the regulatory bureau, and it is hoped, will go a long step toward increasing the effectiveness of the chemical research work of the department.

⚜

An official invitation from the British Government addressed to the United States government, and inviting it to send official delegates to the International Dairy Congress, in London in July, 1928, has been received. It recently reached the Secretary of State, communicated in a cordial note from Sir Esme Howard, British Ambassador.

Secretary Jardine has taken the matter of sending an official delegation from his department under advisement. It is considered probable that steps will be taken to have at least the Departmental officials in charge of this work delegated to attend.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Cereal Study for Juniors

WHAT do we mean when we speak of *cereal* crops? We mean those grasses whose seeds are used for food. You commonly call them *grains*. Corn, wheat, oats, barley, rye, and rice have been called the six great cereals of the world. The word cereal comes from *Ceres*, the goddess of harvests. We are going to talk about wheat, barley, and oats in this story.

While the grain from these crops finds its chief use as food for man and beast, the crops are sometimes cut green before the grain ripens and fed to farm animals. When this happens they are referred to as *soiling* crops.

SOME TYPES OF WHEAT

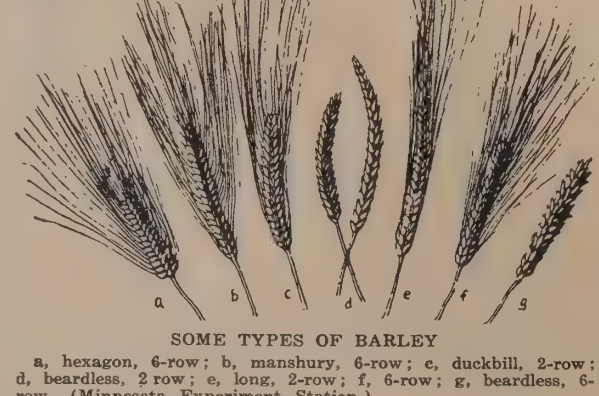
a, emmer (speltz); b, blue stem; c, macaroni (durum); d, fife; e, bearded common.

Wheat the Bread Crop

Which of our grain crops is most used for food by man? Wheat, that's right. Wheat makes flour for bread, and bread is the "staff of life." By-products of wheat flour are bran, middlings, and shorts which are used extensively as feed for dairy cattle and other farm live stock.

Where did wheat come from, and how old is it? The name, wheat, has an interesting history. The English people used to call it "whete," and earlier still they called it "hwaete," which is closely related to "hwit," meaning white. The German word for wheat, "weizen," is related to "weisz," which also means white. Now why should these people use names for wheat which meant white?

If we stop to think that the bread of the Europeans of the poorer classes, especially in Northern Europe, was as often made from rye flour as from wheat flour, we find our reason. Rye is a dark colored grain, and quite naturally people called wheat white to distinguish it from rye or other dark colored grains.



It is probable that wheat grew wild in the valleys of the Tigris and Euphrates rivers in Asia Minor and that it has spread from there to the rest of the world. It was cultivated in Egypt long before the birth of Christ and records indicate that the Chinese cultivated it as early as 3,000 years B. C.

Wheat 5,000 Years Old

Think of it, boys and girls, wheat has probably been a cultivated crop for the last five thousand years, and possibly longer. At that time men used to prepare the ground by scratching it with a stick, and it is quite likely that our own ancestors of that date lived in caves and would not have known what to do with a loaf of bread had it been given them. Since then wheat has spread with civilization. It was introduced into Mexico about 1530 by the Spaniards, and was first cultivated in Virginia about 1611.

Today wheat is grown the world over. No other crop is so important to the civilized world. According to the Year Book of the U. S. Department of Agriculture the total production of wheat in this country for 1926 was 832,305,000 bushels on 56,575,000 acres. Canada produced 405,814,000 bushels on 22,767,000 acres. The five leading states and their production were: Kansas 150,084,000 bushels, North Dakota 77,224,000 bushels, Oklahoma 73,745,000 bushels, Montana 44,665,000 bushels, and Michigan 41,034,000 bushels.

Wheat is classified as either *winter* or *spring*, depending on the season at which it is sown. According to the texture of the kernel, wheat is further classified as hard or soft, and there are both hard and soft varieties of winter and spring wheat.

SOME TYPES OF BARLEY

a, hexagon, 6-row; b, manshury, 6-row; c, duckbill, 2-row; d, beardless, 2 row; e, long, 2-row; f, 6-row; g, beardless, 6-row. (Minnesota Experiment Station.)

Do you know how much a bushel of wheat weighs? Sixty pounds is the correct answer. The standard weight for a measured bushel of oats is 32 lbs. while 48 lbs. of barley is a bushel.

Barley Ancient Cereal

Barley is a very old cereal. Barley and wheat have some things in common. Both were cultivated before we have any history of man. Both are, or have been, bread plants. In early times barley was the chief bread plant of all nations from which our civilization came. Both are cultivated in many countries and many lands. It is said that barley is successfully cultivated in a wider range of climate than any other cereal. It is grown in Lapland and Iceland and in semi-tropical California; it matures at an elevation of 11,000 feet in the Andes Mountains. Barley is classified according to the number of rows of grain on the head as two-rowed, four-rowed, or six-rowed.

In 1926 there were 191,182,000 bushels of barley produced in the United States on 8,200,000 acres. The five leading states and their barley production were: Minnesota, 32,675,000 bushels; California, 23,400,000 bushels; North Dakota, 21,050,000 bushels; Wisconsin, 17,974,000 bushels; and Illinois, 12,710,000 bushels.

Oats Only 2,000 Years Old

Not so much is known of the early history of oats but it is not such an old crop as wheat or barley. The earliest cultivation of the oat plant was probably in Central Europe. Grains have been found among the remains of the Swiss Lake dwellers perhaps not earlier than the bronze age. The cultivation of oats has not been traced much more than 2,000 years.

Just as wheat is known best as a food for man, so is oats recognized as a food for live stock. Oat meal, however, is a product of the oat plant, and is a food consumed in considerable quantities by man. Oats grow best in a cool, moist climate.

The total production of oats in the United States last year was estimated at 1,253,739,000 bushels on 44,394,000 acres. Iowa led in production with 195,960,000 bushels and the four next states in production were: Minnesota, 129,162,000 bushels; Illinois, 123,516,000 bushels; Wisconsin, 96,638,000 bushels; and Texas, 83,660,000.

Juniors at Wisconsin Fair

The boys' and girls' 4-H club department at the 1927 Wisconsin State Fair was the biggest and best that it has ever been. All records were broken for both quantity and quality of boys and girls attending the club camp, of live stock and other exhibits, and demonstrations.

Some 630 club folks were registered by Mrs. Charlotte Wald at the big 4-H camp on the fairground under the genial and efficient direction of Wakelin McNeel, assistant state club leader. The number exceeded the biggest club camp held previously at the Wisconsin State Fair by more than 100.

The tent city, otherwise known as the club camp, consisted of more than 75 big, brown tents for sleeping quarters, and a regular circus tent for the dining room. Harold A. Hovde and Bruce Cartter assisted Mr. McNeel in making this the best camp ever held at the Wisconsin State Fair. The girls were chaperoned by Mrs. Britton and the delicious, nutritious meals were prepared by the famous camp cooks—Mrs. George Mason and Mr. and Mrs. Ernest Hausen.

A large sign on the end of the grandstand which read "Boys' and Girls' 4-H Club Exhibits" brought crowds of state fair visitors to the second floor of the grandstand which was devoted to demonstrations by club members and exhibits of their handiwork. It was also the office of State Club Leader T. L. Bewick, superintendent of the 4-H club department, Miss Beth Salter, assist state club leader, and F. B. Coon charge of demonstrations.

About 150 demonstrators took p in contests during the week. Fi four home economics and 24 agri tural demonstration teams compe Twenty-nine fine county club boo made a very attractive display of work. In addition, the U. S. Dep ment of Agriculture had a series booths on club work. What can made from flour sacks was dem strated in another display wh everything from table cloths, napk and baby rompers to aprons and t els were on exhibit.

The 4-H Club Journal was campers' own newspaper printed d by courtesy of the Milwaukee J nal and edited by Roland C. Hart with the help of a number of members and leaders. Features the entertainment during the w were trips to the zoo at Washing Park, an evening in the grandst an evening at the horse show, stunt night, the latter event in cha of John Burke.

R. A. Turner of the U. S. Dep ment of Agriculture judged dem strations and gave a series of talks, each talk featuring one of H's in the 4-H emblem. Helene Fr and Mrs. Margaret Baker also jud

A live stock judging contest held on Wednesday with about entrants. Irene Boese was the girl to enter. A team from Wes Wisconsin, won first place. It composed of Tilmer Hansen, Nor Egestod, and Myron Ottum. A t from Jefferson County coached by A. Hovde and consisting of Wil Loga, Paul Ramsey, and LaVerne ersohl placed second; the teams f Mondovi, Belleville, and Marshall lowed in the order named. L. M. man and E. M. Tiffany helped duct the contest.

The high individual judges for classes of live stock including d cattle, horses, and hogs were: Kenneth Chrystol, (2) Albert Pa ter, (3) Julius Moy, (4) LaV Ebersohl, (5) John Mueller. judging dairy cattle Clinton placed first, Marshall second, Trempeleau third. Ted Swenson the Trempeleau team was high i vidual, Albert Palmiter second, Ramsey third, Chester Run fourth, and Herbert Ryder fifth.

About 314 dairy calves of quality made as large and fin showing of dairy calves as has been assembled at the Wisco State Fair. Other live stock exhi included 96 hogs, 48 sheep, and 6 entries in the poultry departm George Price, superintendent.

The winnings of little 13-year Wilma Klitzkie were outstand She won first and champion on senior pure-bred heifer in the lar class of the day, second in a st class of 34 junior Holstein h calves, and third in the junior s man's contest. When the se Guernsey heifer class of 26 judged, the first six were member one club, the Guernseyway Calf of Jefferson County. Another i tory was scored for Jefferson Co in the strong competition in the groups in which 15 groups were hibited. Fifteen uniform, typy Gu sey heifers from the Guernsey Calf Club and a like number of

y Holstein calves from the Ideal ein Calf Club made Jefferson ty's exhibit an outstanding one. the junior showmen's contest Dopp won first, Harvey Jensen d, Wilma Klitzkie third, Chester fourth, Una Gruhle fifth, and Schmid sixth. Prizes for this st were given by the Wisconsin Stock Breeders' Association, Arucks, secretary.
l Hildebrand gave valuable asce in the junior live stock deent, and Bill Ibenthal worked beaver keeping the camp in

Our Review Column

[A regular feature of the junior department, reviewing the contents of Hoard's Dairyman for the previous issue. Let's talk it over.]

For further discussion of the following see the September 10th issue.

How much did Mr. Jones figure it cost to produce and deliver milk? Just 13.3c for a quart of milk which delivered to his city customers for 15c. (See page 827.)

What are some of the items figured in the cost of a quart of milk? For labor—washing cows, milking, feeding, cows to pasture, cleaning barn and bedding down, 1.6c; for milk house—cooling, bottling and capping, crating and icing, loading, cleaning utensils, washing bottles, boiler and ice labor—1.32c; operating costs—barn, milk house, silos, ice house, water system, crates, bottle washer, separator, steamer, cooler and strainer —.6c; milk delivery—1.85c; incidental expenses—ice, bedding, insurance, taxes, bottles and caps—.93c; interest 1.67c; feed 4.72c; buying cows—.44c.

What big contribution did Professor Haecker make to the science of cow feeding? He conceived and worked out the idea of fitting the ration to the fat test of the milk produced. (See page 828.)

How important is agriculture in India? It occupies three-fourths of the entire population. (See page 829.)

How was the first agricultural fair in India advertised? Since more than 90 per cent of the people are illiterate, the only advertising that could be effective was by word of mouth. Volunteers visited villages and got the leading men interested. The village crier, preceded by a tom-tom, proclaimed the coming show.

How can sweet clover hay be made? L. S. Gillette has had success using the binder to make a fine hay from sweet clover. Using the binder saves the leaves and leaves the stubble in good shape for a second crop. (See page 838.)

What is the name and record of the new United States champion cow? The largest butterfat record ever made in one year by a cow in this country has just been completed by Daisy Aaggie Ormsby 3d a 7-year-old Holstein owned by Lakefield Farms of Michigan. She produced 33,140 lbs. of milk containing 1,286.23 lbs. butterfat. (See page 846.)

Junior Letters

My Calf Club Experiences

Hoard's Dairyman Juniors:—On June 1, 1926, I enrolled in the Pine Creek Calf Club of Dickinson County, Michigan. Mr. Lonsdorf is our county agent. My father purchased a registered Holstein calf for me from our neighbor for $35.

I was given entire charge of this little calf. I brushed him three times each day and also rubbed him with sweet oil every day. I took him out for a walk two or three times a week, a half hour at a time. He was also fed three times a day at regular hours. The amount of grain fed per day was 6 to 8 pounds, 19 pounds of milk, and 5 pounds of hay.

This little animal became a regular pet. He recognized my voice as soon as I entered the barn, and I petted him a great deal. At first he was quite wild when I took him out, but I finally succeeded in making him walk nicely.

On September 4—8 Dickinson County held a fair and all calf club members were notified to prepare their calves for entry. I clipped him, shined up his hoofs and horns, and gave him a bath. I made a new halter of rope with green ribbon, a pretty white blanket trimmed with green and green lettering "Pine Creek" and an American flag on one side.

When entry day came I was so proud of him. During the fair week he did just what I wanted him to. In the parade I was first with my calf behind the band.

To my surprise, the judges awarded my calf first prize in the calf clubs and first prize for the registered stock. I also got grand champion of Dickinson County and our club took first prize which was $10. It was divided between the eight members in our club. The total amount of money I received was $17.25.

My address is Route 1, Vulcan, Michigan.

Marie Rozine.

Testing Seed Wheat

Hoard's Dairyman Juniors:—I tested our own wheat this year for germination. The way I did was to take a pie pan, fill it full of sand, take an ink blotter, count out 100 kernels of wheat, put them on the blotter and place it on the sand and put another blotter over that; then moistened thoroughly each day and set in a warm place. My birthday is July 21st.

Ziela E. Golden.

North Dakota.

THE NEW STANDARD SPEED WAGON

What it means to the farmer

the Chassis $1345 at Lansing

It means the savings of getting to market and back more quickly, for the new Speed Wagons are still faster, still more powerful, still stronger pulling on any road.

It means less danger of damage to goods in transit, for the new Speed Wagons are easier riding than even Speed Wagons have ever been before.

It means surer control on slippery pavements or in meeting the emergencies of the road, for the new Speed Wagons are equipped with 4-wheel brakes.

It means new comfort in any weather, for the new Speed Wagons assure "coupe comfort" with their new and improved cab and driver accommodations.

It means new ease of loading, for the new Speed Wagons are lower—"only thigh-high."

And it means even more of the dependability, long life, and sure economy which in the past have made Speed Wagons the ideal farm truck.

Try one today—see for yourself what Speed Wagon improvements can mean to you.

ENGLISH ROYAL SHOW

JESSIE M. HILL, WISCONSIN

I ATTENDED the English Royal Show this summer which is the largest show in the British Isles. It is held at the end of the show season, the first part of July, and all the exhibits entered are the winners at the county shows. In many ways this Royal is like the fairs held in this country, but in more ways it is different. First, its interests are wider. It is not a live stock show, a machinery show, or any other special kind of a show. It includes all the branches of agriculture.

A model suit for the dairy as exhibited by the Reading Experiment Station in a clean milk demonstration.

The buildings are the property of the Royal Agricultural Society and each year they are set up in a different city. This has been done for 86 years. This year the show was held at Newport, Monmouthshire, a port on the fringe of the rich Wales coal fields. The buildings covered a 127-acre park belonging to Lord Tredegar, president of the society.

The attendance was small the first part of the week, but swelled greatly toward the end. This was partly due to the rain and partly to the policy of price charged for admission. The first day of the show all except a few of the classes are judged and the admission to the grounds is $2.50. The price decreases about half each day and the last day it reached 25 cents. One member of the society admitted to me that the reason for this was that they wanted to keep the crowds away on the day that most of the exhibitors wished to attend the show.

The largest number of entries were made in the cattle department; 1,214 was the total for the 20 breeds represented. Dairy Shorthorns topped the list with 183 entries and there were 130 regular Shorthorns.

It is interesting to note that although we hear a great deal in England about the many local dual-purpose breeds, the Holsteins, or British Friesians as they are called, had the second largest number of entries—155. Jerseys were fourth with 91 and Guernseys sixth with 78. These three breeds of cattle were the only ones shown that were not originated in the British Isles. Herefords were fifth in the number of entries with 88 animals.

There are separate outdoor rings fenced off for each breed of cattle and judging was all done on the first morning in the pouring rain. One man judged all the cows of a breed and another all the bulls. Prizes of $75, $50, and $25 were offered for the first, second, and third, respectively. In the largest classes $20 and $15 were given for the fifth and sixth. The blue ribbon at all English shows goes to the second prize animal and a red one is given to the first.

Every afternoon a parade of the prize cattle was held in front of the grandstand. There were many breeds that I had never seen before although they may have representatives in this country.

There were the mottled beefy Sussex cattle with drooping horns; the black horned Welsh, hardy natives of the hills around Newport; the ugly spotted black, white, and tan Longhorns with horns worse than the old time Texas steer; the large white Park cattle descended from the wild Park cattle. There were only 10 entries of the last breed and there are but a few herds in England. Also there were the Belted Galloways much like other Galloways except for a white belt around their bodies and the white and bluish gray mottled Blue Albion cattle. The last breed in the parade was the Dexter, a black milk breed that is very small. The head of the largest bull was not as high as the waist of the man leading him and their legs were so short that they had to run to keep up with the other cattle.

Other breeds shown were the Aberdeen-Angus, Galloway, Lincolnshire Red Shorthorn, Devon, South Devon, Red Poll, and Kerry.

The total number of horses entered was 429, and 524 sheep shown this year from 18 breeds. Records for past shows give 28 breeds of sheep, all of British origin, that have been represented at at least one of the shows during the last four years.

Six hundred sixty-four pigs were entered from nine breeds. Large White headed the list with 150 entries, Middle White was second with 150, Large Black third with 122, Berkshire fourth with 72. Other breeds entered in order of their numbers were Wessex Saddleback, Gloucestershire Old Spots, Long White Lop-Eared, Tamworth, and Essex.

All of the milk was taken dairy and used in a demonstrati butter and cheesemaking. times a day a clean milk demor tion was given by the governmer periment station at Reading. attracted many of the farmers the questions they asked were elementary.

I noticed that nowhere at the was there any exhibit to show value of milk as a food and t courage the use of it. I asked leader of the clean milk demor tion about that and he told me

OCEAN PREMIER, CHAMPION JER BULL AT ENGLISH ROYAL SHO Owned by L. G. Gisborne

their first job was to teach the fa to produce milk that the public depend upon.

The machinery exhibit was different than that shown at the and county fairs in this cou Only two milking machines and tors were exhibited. At least ticed no others and the ones tention. The big drawing card the churn. One tent that must shown at least 30 kinds and of small hand and machine c was filled with buyers all the The large steam trucks which common in England and the de stration of fireplaces were also lar.

The farmers in the counties Newport had orchard and plant competitions for orchards and lots of various sizes, ages, and of trees. One class called for less than 1,000 acres of wood The judges were to take into acc the systematic management for production of timber, ornam planting, planting for sporting poses, and management of the h rows. There were 15 entries in class.

There were no home econo demonstrations and no boys' girls' club work, but I believe there was most everything else you could think of. Some of the exhibits were horseshoeing, seed ing, wool, honey and bees, c cheese, butter, marketing and g ing of products, gates made on estate of the exhibitor, flowers, pared stock food, farm papers, c ens, ducks, geese, turkeys, fen and agricultural education.

College Ayrshire Cow Sets World's Record

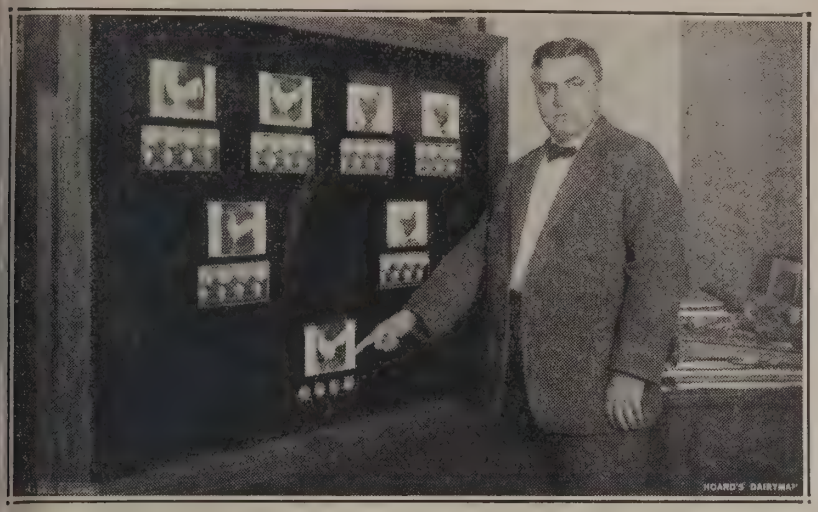
A world's champion Ayrshire record in the 305-day class has been made by Sir Robert's Romona Bell, owned by the Pennsylvania State College. Completing her year as a junior 4-year-old, this Ayrshire champion produced 14,744 pounds milk and 572.42 pounds fat. Because of this record she wins a French cup.

When she was a junior 2-year-old she produced 12,861 pounds milk and 534.5 pounds fat, winning a French cup in 1924 by producing more milk and butterfat than any other 2-year-old that year.

Sir Robert's Romona Bell was presented to the college by the Masonic Homes farm, at Elizabethtown.

Farmers' Judging Contest

The fourth annual Farmers' Cattle Judging Contest will be held at the National Dairy Exposition, Memphis, October 15 to 22. This contest is open only to farmers who have had no regular training in cattle judging.



Last year it drew more than 300 tries from seven states. Becaus the great interest now being take dairying in the South and the w spread demand for dairy cattle, believed that more farmers will c pete this year than ever before.

L. A. Higgins, dairy specialist f Mississippi and a well known da man, is superintendent of the test. Classes are offered for team three members and for individu Entry blanks and announcem may be had by writing the Exposi office at Memphis.

Herediscope Demonstrates Inheritance

A MECHANICAL contrivance called a herediscope has been invented by R. R. Graves of e Bureau of Dairy Industry, U. S. A., to aid in teaching the Mende n theory of inheritance in dairy imals.

"Inheritance," says Mr. Graves, "is ch a complex study that the aver e person is unwilling to expend the ne and effort necessary to gain an derstanding of the subject merely reading about it. Furthermore, it extremly difficult even for those ll versed in the subject to write

R. R. GRAVES OF THE BUREAU OF DAIRY INDUSTRY, U. S. D. A., AND HIS NEW INVENTION, THE HEREDISCOPE, FOR TEACHING THE THEORY OF INHERITANCE IN DAIRY AND OTHER ANIMALS

lecture on heredity so that it can clearly understood by those who ve not made some study of the sub t. By means of this newly de ed machine, tentatively named rediscope, it is hoped the most sim and fundamental principles of edity can be more easily explained those whose work demands that y have some knowledge of the vs of inheritance."

The use of the herediscope need be confined to teaching inheri ce in dairy cattle. Fundamental nciples of heredity are the same in plants, animals, and humans.

The machine consists of a number of groups of aluminum cups, each group representing an individual animal and arranged in the form of a pedigree showing three generations: four grandparents, two parents, and one offspring. Numerous small, colored balls, each representing a given hereditary character, such as the "factors for high production of butterfat" or "low production of butterfat," are placed at random in the cups of the starting generation. When the operator presses a trigger connected with the mechanism, half of the character-symbols from each parent-cup are transmitted to the offspring, the selection of the characters being merely by chance as is the case in actual matings. By repeated matings the observer is able to note how certain characters may be transmitted from generation to generation, or how they may be lost entirely in the process, how they may be present in an individual but covered up by dominant characters, and how in the absence of dominant characters they may again appear.

The 1927 Ohio State Fair

(Continued from page 884)

n the groups, Gayoso won four ts, and Firestone got one. Gayoso o got 3 of the 6 second places in groups.

n the championships, Firestone's geant's Governor of Montrose re ted last year's performance and s made senior and grand champion; yoso won junior championship on yoso Golden Beau. Sepascot Pearl Georgland Farm likewise repeated t year's performance by being de senior and grand champion cow. yoso was runner up with Gayoso lden Beauty.

Ayrshires

Judge: S. M. Salisbury, Ohio.

Six Ayrshire breeders with 54 ani ls sought the favor of judge Salis y's eye in hopes of making some ney or at least getting enough to d their cattle home or to the next test arena. When all the ribbons l been distributed, it was found t James E. Davidson, of Michigan, l won seven firsts in the singles and ry blue in the groups, to which he led a purple each for his senior l junior champion females and ior champion bull calf. This left blues in the singles which were ided 3 to T. T. Hileman of Penn vania and 2 to B. G. Betts & Sons, Ohio. Hileman won a purple on his senior and grand champion bull, Favorite Crusader.

Top places in most classes were not filled by outstanding animals like, for example, Strathglass Roamer and Primrose of B. M. 4th, champions of last year.

Brown Swiss

Judge: C. L. Blackman, Ohio.

Last year in writing the Brown Swiss show we said, "George H. Neuhard of West Virginia battled with Hull Bros. of Ohio but was badly beaten. What could he do with no other exhibitor to help break up the Hull herd defense?"

This year, for some reason, it was different. While Neuhard himself didn't get so much of the blue and red, he had the satisfaction of seeing the Hull herd defense badly cracked. A breeder by the name of A. E. Bower and Son came over from Illinois and took 7 firsts to Hull's four in the singles; between these two Neuhard got 2 blues. Bower also went a step down the line and took 5 reds to the same number for Hull Bros.

When it came to groups, Bower took four firsts and 2 seconds to 1 first and 3 seconds for Hull Bros. Neuhard got 3 whites in the groups.

When the best from the singles were led in for championships, however, it was found that Ursula Stasis and old Swiss Valley Girl 9th of the Hull Bros. herd are still hot campaigners and they were made senior and grand champions. The Junior champion bull was likewise from the Hull Bros. herd. Bower got a little purple to take home when his Septana of Bowerhome was made junior champion female.

Nature has furnished crisp, green vegetables to take the place of the old fashioned spring tonic.

Take the Backaches Out of Barn Work

You'll be money ahead when you put in a Star Litter Carrier and you can say "Goodbye forever" to the meanest job that ever soured a hired man or drove a good boy away from the farm home.

Every dollar you invest in a Star Carrier comes back ten-fold. In time and labor saved it pays for itself the first year or two and it lasts for years and years.

NOTHING LIKE STAR CARRIERS

Quick raising and lowering. Easy running. Never in the way; always on the job.

MADE IN THREE STYLES

For cable track, rigid track or combination of the two. And you'll be surprised at how little they cost compared with how much they save you in hard, cold cash.

GET OUR BIG 220-PAGE BOOK—It tells all about Star Carriers. Also about Star Stalls, Pens, Water Bowls and other conveniences. Send a sketch showing size of barn, location of door and carrier track and we'll give you some figures that will help you decide which kind is best for you.

worth. He still believes that the American farmer will some day have "spunk" enough to stand up and fight for his rights instead of lying down to grumble about his lot while misdirected politicians claw the air for his votes.

What is more, Henry still has faith that education will eventually teach the farmer sense enough to do what all other lines of business are doing and he will put his shoulder to the wheel of co-operation and push to the common weal of all. That is just what is happening in the Land O' Lakes Creameries Association, Inc. The farmers of this organization are finding that they can turn a pretty big wheel when all of them get together and push at the same time, as they improve the quality of their products.

Henry Happy Among Flowers

Most readers of Hoard's Dairyman are already familiar with W. A. Henry's book on Feeds and Feeding and with the work that he did in developing the Wisconsin College of Agriculture, but perhaps there are many who would be interested in an account of his present activities. He has never entirely recovered from the nervous breakdown that led to his resignation of the college deanship in 1907, but he has sufficiently built up his pre-spent health so he can find pleasure in living.

He had just returned from his daily visit to the Balboa Park Zoo when we rang his doorbell last D cember to give him our greetings. interested was he in getting the ne of the Middle West that he not on invited us to have dinner with the but to stay at his home for the nigh In the course of the evening's co versation we learned that he expec to remain in California until death. He recalled his early e periences at the college when started out on a salary of a thousa dollars a year and with only a $2,0 yearly appropriation to run the fa and the agricultural college togeth

Henry has no more use for a d honest man now than he ever ha He takes great pride in the fact th he rarely made a mistake in choosi a man for a position in the colleg This resulted in what is conceded be the strongest group of agric tural scientists on his faculty of a college in the country. If the tru may be said, we believe that his re greatness lay in his ability to g good men to work for him and to i spire them to do their best. He w a close friend of former Govern Hoard from whom he received mu valuable advice and assistance.

After he left the college he help his son develop one of the finest fr farms in the East at Wallingfo Connecticut. He built himself home among the flowers of southe Florida where he made a remarkab botanical collection. His sister, Lyd in the meantime was teaching scho at Riverside, California, most of t year and spending her summers Florida. The climate there did n agree with her, however, so she pe suaded her brother to move to S Diego. This he did a few years a and they now live together in a bea tiful home not far from Balboa Par Henry's Florida home was injured the hurricane, but the damage w not irreparable as the buildings we well made, so only minor repairs the roof were necessary.

Since Henry invited us to go wi him to the zoo on the following da we started early to visit his "friend in the park. We spent several hou walking up and down the hills of th magnificient enclosure, so we mu have covered six or seven miles b fore we got back to his home agai He did not seem greatly fatigu from the exercise, though. Many the birds and animals know him a wait for his coming, as he always ca ries a big bag of popcorn and peanu to further cement their friendship.

This daily walk and his work in h garden now constitute his main e joyment in life. When the opport nity presents itself, however, he lik to take a ride to the Chula Vista di trict to see the land that he on owned and directed. He set out t first lemon trees in this area that now noted in all the country for i fine quality of citrus fruits. Some the trees that he set out are still li ing and we were told that a few them will probably be preserved f their historic value. Just before v bid the Henrys goodbye, the gra old man presented us with some fr of his own raising. We are sorry report, however, that the governme inspectors of Arizona took it from when we crossed the state bord line, as they are trying to keep ce tain diseases in check there just the corn borer committee is doing the Middle West.

Often since we have returned Wisconsin and have walked up t Henry Quadrangle on the colle campus, we have thought how fitti it is that memorials have been erec ed here for both Hoard and Hen because of the work they have done helping to make agriculture wh Washington said it is: "The most n ble occupation of mankind."

Camels—so mellow, mild and unfailingly good

MODERN, particular smokers, it is your insistence upon the best that makes Camel lead all other cigarettes. You are hard to please. In the true spirit of the modern age, you look for until you find value supreme in a cigarette. And it is this unremitting search for quality that puts Camel overwhelmingly first.

For Camel combines all those virtues so indispensable to the cool, satisfying smoke. The choicest Turkish and Domestic tobaccos that Nature's sunny fields produce. And a blending that brings these inimitable flavors and fragrances to the delighted taste of the smoker. Really, there is no other smoke like Camel. No other can be so everlastingly good.

If your taste calls for the enchantment of the finest, just try Camels. Always tasteful and smooth. Always so mellow and mild.

"Have a Camel!"

h Herds from Continuous Testing

ARD'S DAIRYMAN:—The annual of the Allegheny County Asso- n of Pennsylvania brings to many facts not easily noticed ier times. Chief among these to be the outstanding improve- made by herds in their second of testing over the first year. ear we had 14 herds with over -lb. average. Only one of these n its first year of testing, the all having two or three years rk to their credit.

show the value of the second testing over the first I will give ures on four different herds for o years:

umber	Pounds fat per cow 1926	1927
	410.9	495.9
	296.8	369.3
	272.5	350.1
	268.2	330.4

ny more figures of the same ould be given if time and space permit. Needless to say the on these herds increased along heir production. The average per cow in herd Number 2 was $50 higher than last year, or than enough from each cow to or the year's testing of the en- erd of 20 cows. Does this not that it pays to keep on testing after year,

previous records were broken s year's work. The pure-bred of Guernseys, owned by Fair- Farm, was high herd with an re of 495.9 lbs. fat. Their cow, was high with a production of lbs. fat.

association average for the was 8,528 lbs. milk and 327.2 at. This is an improvement ast year's average of 580 lbs. nd 22.9 lbs. fat.

GORDON J. RICE, Tester.

veet Clover in August

RD'S DAIRYMAN.—The month gust with dried up pastures has no exception in the Erskine— osh Association of Minnesota, usual drop in milk production stify. One fact, however, has t out vividly the superiority of clover pastures and its ability hstand the hot, dry weather of fall. All five high herds for August are herds having suffered the least slump in milk production and they had sweet clover pasture. In fact every herd producing over 25 lbs. of butterfat per cow this month produced it on sweet clover pasture.

Cow testing association records show that sweet clover offers a better pasture for cows and, other things being equal, cows do not drop off in milk as fast in the early fall on sweet clover as on any other pasture except alfalfa. Having an extra month or two of good cheap pasture can effect a saving of from $5 to $10 per head in the feed bill besides saving additional labor at the busy time of harvest.

A plan that has been followed with great success is to pasture the second-year growth until after harvest. Sweet clover is seeded in small grain and after the grain has been harvested the fresh pasture is made available for cows. Sweet clover seems to stand a reasonable amount of fall pasturing better than other clovers. If good rains occur shortly after the grain has been cut, a long and abundant pasture season is assured.

To make sure of plenty of fall pasture a generous acreage may be seeded, as the seed is usually cheap and part of it may be plowed up in the spring for corn or other crops. By plowing in the spring instead of fall, sweet clover will not be troublesome in the following crop. Some of the advantages in favor of sweet clover are its adaptability to most soils, it fits in well in rotations, pastures more cattle per acre, the seed is cheap, it is not affected so much by drying weather, and is a good method to control weeds.

MORRIS C. GROVE, Tester.

Alfalfa Pasture Saves Money

HOARD'S DAIRYMAN:—The following comparison of alfalfa and bluegrass pasture tells the story:

Month	No. of cows	Average milk	Average fat	Kind of pasture
		lbs.	lbs.	
July	9	804	32.2	bluegrass
August	9	907	35.3	alfalfa
Gain per cow		103	3.1	

The nine cows were fed $3 worth of 16 per cent protein dairy ration per cow in July, while in August they received $2.45 worth of the same feed. This leaves a saving of 45c

More Milk By Using BOVINOL

REG U S PAT OFF

Agricultural experiments and practical dairy tests have proved that the consistent use of Bovinol will cause a 10% increase in milk production. More milk means more profit.

Bovinol protects cows from flies. Cows waste energy fighting flies. Scientists estimate that the energy used by an animal in fighting flies is equal to the food value of a pound of oats per head per day. Bovinol prevents this waste of energy.

It's easy to apply Bovinol—takes less than a minute to spray one cow. Use the compressed air type of sprayer in which the oil is forced out by air pressure and is further atomized by an air blast. Spray the cow night and morning, taking care to cover every square inch of the hide. Bovinol will thoroughly penetrate if you spray against the direction of the hair.

Bovinol is a pure and highly refined oil, stainless, odorless, and tasteless. It contains nothing that will irritate or injure the hide of the animal—in fact many dairymen use it as a dressing for cuts and scratches.

Cows will graze in comfort after being sprayed with Bovinol and your kindness will be repaid by larger milk yield. Every morning and every evening spray your cows with Bovinol.

Lay Them Now!

Now, while cows are in pasture, insure their health and milk yield during the long, cold winter months by flooring your stalls with warm, comfortable Circle A Cork Brick.

Because they are nonabsorbent and nonslippery Circle A Cork Brick are safe to stand and lie on. They protect your cows from chill and dampness and prevent the dangerous winter ailments that decrease milk yield and profits. They are as good an investment for the small herd as for the big one.

Plan to give your cows this protection before winter comes. Write for a sample brick and the illustrated book, "Circle A Cork Brick" *now*. Address ARMSTRONG CORK & INSULATION COMPANY *(Division of Armstrong Cork Company)*, 112 Twenty-fourth Street, Pittsburgh, Pa.

Opinions, Brickbats, and Bouque

These columns are open to the readers of Hoard's Dairyman for the expression o their opinion on any subject, whether radical or conservative, destructive or constructive wise or foolish. It may be cows or crops, religion or politics, or what at the time mos interests you. It may be critical or commendatory, but it should be your opinion. It i your own editorial page but your editorial must not exceed 250 words. Hoard's Dairyma assumes no responsibility for opinions expressed.

Louisiana Flood Area

HOARD'S DAIRYMAN:—I have had a number of inquiries from people in different sections of the country as to the flood damage done here and I would like very much to inform readers of Hoard's Dairyman that this (western) section of Louisiana is not in the flood area.

DeRidder has an elevation of 206 feet and is twenty-five miles east of the Sabine river which does not overflow from its bottom. It is approximately 125 miles west of the present overflow of the Mississippi and its tributaries.

DeRidder, La. L. N.

Jones Corrected

HOARD'S DAIRYMAN:—I notice in your July 10 issue a letter from F. M. Jones, New York, entitled "Want More Milk." Apparently Mr. Jones is unaware of the fact that upon May 1 this year the League paid back to the holders of Series A certificates the entire principal and interest due at that time, a total of something over $2,500,000.

His reference to certificates and revolving fund in his letter leaves the reader with the thought that the League was not meeting its obligations in this respect, which is very far from the truth. As a matter of fact, and as no doubt you probably know, this association redeemed nearly half of Series A certificates previous to their maturity, the original issue being something over $4,000,000.

New York. D. J. CARTER.

Unity and Organization

HOARD'S DAIRYMAN:—In your July 10th issue is an article on "Teaching Agriculture Self-reliance." I suppose it is a joke but as a farmer I fail to see it. In the cartoon Shipping, Mining, and Manufacturing are standing in a swimming hole laughing at Agriculture who is afraid of the water and is being tossed in by Unity and Organization.

The government allows mining, manufacturing, and railroads, unity and organization but forbids them to agriculture. The McNary—Haugen bill would create unity and organization among wheat growers, cotton, and hog growers through a nation wide co-operative pool (Unity) of those products and would furnish the necessary operating machinery (Organization) to make the pool effective. President Coolidge by his veto refused to allow agriculture the aid of unity and organization in learning to swim.

Manufacturing, railroads, and banking are not "self-reliant." Manufacturing works behind a high tariff wall and is aided by corporate organization. The steel trust founded in 1901 with a $600,000,000 capital half water, and working behind a government constructed tariff wall has taken out the water and recently declared a 40 per cent stock dividend. True, it is highly successful, relying on the strongest kind of government aid. If the steel trust is self-reliant, why did President Coolidge raise the tariff fifty cents a ton on steel the same week he vetoed the farm organization pool of cotton, wheat, and hog producers?

If the railroads are self-reliant, why did that same government pay them $500,000,000 because of war losses and pass laws guaranteeing return on capital through increas rates?

The banks are very far from s reliant. Consider the Federal Res Bank Act—a government pool of national banks and national b credits.

California. ROBERT D. KELLOG

Collegiate Education

After reading and studying sound logic which you have dispe in "Collegiate Education" I ca do otherwise than admit that have convinced me of the error in judgment of education, but like "man who convinced against his is of the same opinion still"—ther one point on which I do not see light. According to your point view it is of little consequence girl does not receive a college ed tion if she is not willing to sp from six to eight years earning studying. Suppose that same wishes to marry in less time that? A college education is meant to fit a person to earn a li only, it is meant to fit them for in its various aspects and proble to my notion, and therefore a should not be entitled to a college cation only with the understan that she is going to devote her w life to a career. Surely motherh is more noble and should requir much thought, education, and pr ration as any other position of li

My folks were not in a positio send me to college without too gre sacrifice on their part. I could permit that. I was engaged t married before I graduated from school. My plan was to go to col by borrowing the money, ther teach until I had paid it back, but fiance was not willing to wait long to be married. He would l waited the four years it would l taken me at college but not eight his people wanted to leave the f and he would be here alone. Natu ly I gave up my dreams of colleg

I was too young to marry, and w is more, my ideas and opinions, my own character was not e enough formed and definitely enc founded to bear up under the t bles that descended upon my inno head. I have conquered at least of the difficulties, but I have a monition that I am not through e The ten years that it has taken even to get where I am have been years of floundering and despe struggle as far as I was concer I still believe that if I had had a lege education behind me which w have helped to strengthen my id mold my character, and give mea inkling of which way to turn, to a nothing of maturing me a bit, a my struggle would have been infi ly easier.

It is not the dollar and cent p sition or even the position one is to obtain with a college education a interests me the most; it is the e it has upon one's own character.

My brother-in-law is working way through the University an quite agree with you in regard what he will get out of it. It has the making of that boy to hav work his own way, and he neede for he was spoiled. His parents not believe in college, though. I certain that he will be twice the because he was so determined to an education at any cost.

May I congratulate you upon very remarkable editorial.

Guernseys

Judge: W. W. Yapp, Illinois

Minnesota had a larger Guernsey show this year than did Wisconsin but it wasn't of quite such good quality, particularly in the classes for milking females. There were 131 head shown by 21 exhibitors.

D. D. Tenney's three-year-old bull, Cherub's Golden Secret of Shore- wood, was the best of the bulls. He isn't the outstanding show bull that his sire, Ladysmith's Cherub, was some years ago, but he made a very satisfactory senior and grand cham- pion.

The junior champion, Cherub's Se- quel's Leader, owned by F. B. and E. H. Hardy, is a calf with very good lines and one that could be made a strong contender at almost any show.

Dr. H. T. Smith of Iowa had the winning aged cow, Faith's Wonder of Smithdale, just a little smoother cow with what appeared to be a better udder than most of her near com- petitors, but the judge didn't find her quite so good as Miss Myrtle of Maple Hill, a three-year-old owned by Boulder Bridge Farm, and the lat- ter was senior and grand champion.

Radisson Farm showed the junior champion, Ultra Coronet of Radisson, a senior yearling.

In the final check up of awards, D. D. Tenney won 6 firsts, Radisson Farm, four, and Boulder Bridge Farm and F. B. and A. H. Hardy, Minnesota, Dr. H. T Smith, Iowa, and Ransom Farm of Kansas each had two blues.

xercise for the Bull

D'S DAIRYMAN:—The first demonstration of constructing exercise yard was held on the David F. Mazelin of Adams Indiana, last May. The dem- on was in charge of J. H. Hil- Purdue University.

October when the Adams Cow Testing Association fin- he second year's work, there even herd sires with three or aughters included in the rec- At a meeting held to discuss ults obtained, it was learned of the eleven sires had been the block. At least two of ills gave promise of being out- g sires.

ng the discussion which fol- d the importance of retaining the community until at least ughters had completed yearly was brought out. By com- these records with those of ns, the real value of the bull measured. The writer, who was at the meeting, suggested the more general use of exercise yards for bulls as a safe and satisfactory means of retaining bulls now in serv- ice until records could be secured on their progeny.

The meeting unanimously voted to hold a bull pen construction demon- stration on some member's farm dur- ing the spring. Roy L. Price, the cow tester, was instructed to select a suit- able place and date for the demon- stration. Conditions on the Mazelin farm offered many inducements, in- cluding splendid co-operation on the part of the owner. All preliminary arrangements were planned by Roy Price, L. M. Busche, the county agent, and J. H. Hilton.

Discarded two-inch gas pipe was selected as the most economical and satisfactory material to use. The yard, which is located at the south- west corner of the barn, is 76 feet long and 30 feet wide. Aside from the labor required to set the posts, the total cost of material and fitting the pipe, including three strands of barbwire between each row of pipe, was approximately $45. Posts were set six feet apart. A breeding pen of similar construction is located at the entrance of the pen. In this way, all necessity for handling the bull is eliminated. A tree at the edge of the pen furnishes shade when the bull does not choose to remain in the stable.

Each year there are scores of good sires sent to the block which could be retained for a longer period of use- fulness if each dairy farm were equipped with a substantial bull pen. A small cost outlay and a little time, when work is not rushing, invested in a bull pen would return a handsome profit. There is an urgent need for more proved bulls in the Middle West at the present time.

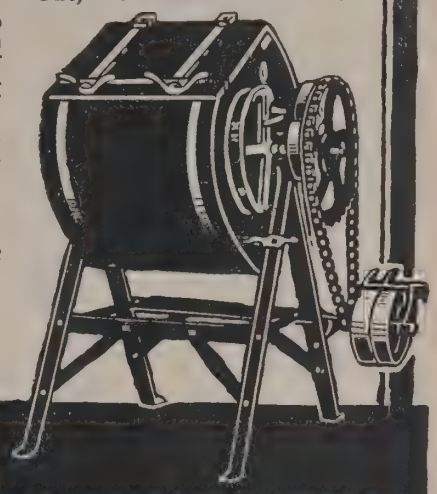
Indiana College of Agriculture.

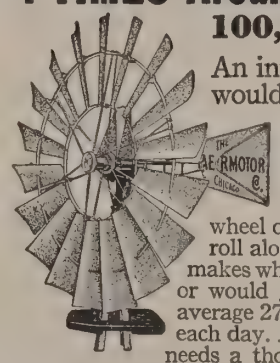


A BULL SAVING YARD

MINNETONNA
HOME BUTTER MAKER

A WONDERFULLY efficient butter mak- ing machine built on the same working principles as the machines used in large cream- eries, differing only in size and price.

It gets all the butterfat out of the cream. It churns rapidly so the butter comes in from one-half to one- fourth of the time. By simply throwing in clean water and giving a few turns, you remove all buttermilk. In- stead of working the moisture *out*, the MINNETONNA works the moisture *in*, so necessary to the flavor and the keeping qualities, and giving an "over-run" (of moisture and salt) of from 20 to 25 per cent above butterfat test. Hence *more* and *better* butter.



Churning capacity 3 to 12 gallons. Working capacity 3 to 20 lbs. Larger sizes up to 100 lbs. capacity.

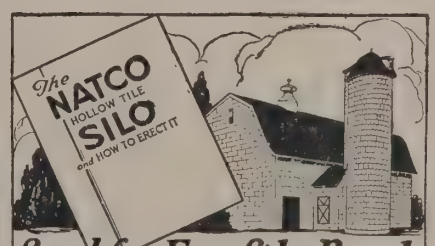
CHURNS THE BUTTER AND WORKS IT.

4 TIMES Around the World with ONE OILING
100,000 Miles Without Stopping for Oil



An inventor who could develop an airplane which would perform such a feat would be considered a wonder. But such is the record of regular accomplishment by the Auto-oiled Aermotor in pumping water.

Did you ever stop to think how many revolutions the wheel of a windmill makes? If the wheel of an Aermotor should roll along the surface of the ground at the same speed that it makes when pumping water it would encircle the world in 90 days, or would go four times around in a year. It would travel on an average 275 miles per day or about 30 miles per hour for 9 hours each day. An automobile which keeps up that pace day after day needs a thorough oiling at least once a week. Isn't it marvelous, then, that a windmill has been made which will go 50 times as long as the best automobile with one oiling and keep it up for 25 or 30 years?

The **Auto-oiled Aermotor** after many years of service in every part of the world has proven its ability to run and give the most reliable service with one oiling a year. The double gears, and all moving parts, are entirely enclosed and flooded with oil. **Aermotors and Aermotor Towers withstand the storms.**

Poultry

Feed and Other Things

There may not be anything new in the world but there certainly are a lot of the old things that demand constant repetition before much of an impression is made. If continued dripping of water can wear away most any surface, possibly constant telling may result in adaption of better practices. This fact is particularly applicable to the use of dry mash during the entire year.

Last week, before attending a meeting, a visit was made to the local farmers' feed mill. This is in an exceptionally good farming section and is typical of any of the better parts of any state.

A monthly record was kept of sales of all classes of feed. They do not handle any commercial feeds but either sell a locally mixed feed based on a standard formula or will grind oats, corn, or barley that the farmer may grow and add the other necessary ingredients required for a complete mixture. They will also mix any concoction that the farmer may desire.

The sales of laying mash feed follow: January, 11,575 lbs.; February, 13,550 lbs.; March, 10,150 lbs.; April, 7,175 lbs.; May, 4,725 lbs.; June, 4,350 lbs.; July, 3,925 lbs.

Egg production would in this case show the same trend because, although this was a dairy section, they produce whole milk or cheese and have no skimmilk or buttermilk as a source of animal protein. This record shows that feed is purchased when the egg price is high. Just as soon as the price drops the feed is also decreased, the ration is limited, production drops, and the cost of production is raised and the flock becomes unprofitable. Any flock can show some profit when the price of eggs is high and feed cost is low. When the margin between selling price and cost of production is decreased it becomes increasingly necessary to pay greater attention to efficiency. Dry mash feeding is one part of that program that one cannot afford to ignore or neglect.

Not only should this mash be kept in an open hopper available at all times, but during July and August a moist mash should also be fed at noon. This additional feed sort of concentrates production and results in one obtaining the last few eggs that a hen will produce that season in a shorter time. It is much like using some water to rinse out the milk pail. The regular dry mixture, moistened to a crumbly condition with milk or water and fed in an amount that the flock will clean up in ten to fifteen minutes, is sufficient.

In our state, as in most of the others in this section, probably not over ten per cent of the farm flock owners feed mash during the entire year. In Connecticut, which is a poultry section, not more than five people raising poultry in the state do not feed mash continuously. If it is profitable for them to do this when located in the section of high feed prices, it is profitable to do so in all sections.

Numerous mixtures are available and recommended. Probably the most universal mixture consists of 100 pounds each of ground corn, ground oats, wheat bran, standard middlings, meat scrap or digestive tankage, and one per cent of table salt. This means one pound of salt to each hundred pounds of mash mixture.

Colds

From now on until housed for the winter, it is not unusual to detect colds in the young flock. The condition is usually indicated by a sniffling, watery discharge from the eye or nose, and often swelling of the eye.

In great measure this is caused by improper management. Too often one forgets that as the pullets grow and develop the house must increase in proportion. One means by which this may be done is removal of all the cockerels and a second by transferring part of the flock to another house.

Roosting on the ground beneath the colony house or on the floor of the house should be discouraged. Early in the chicks' development is the most opportune time to train them to roost but it may also be done later.

The colony house should be well ventilated by opening the windows. Crowding caused by roosting on the floor or by insufficient number of perches may cause colds which can later develop into roup, pox, canker, and the other associated troubles.

To prevent any possibility of the other forms due to nutrition, one should feed liberally on yellow corn and also fresh, succulent green feed.

A treatment is always a mighty poor recourse. In this case if one is unfortunate enough to run into such trouble, Epsom salts may be used. This material can be given at the rate of three-fourths to one pound per hundred birds, dosage being dependent upon growth. Mature fowls usually get one pound per hundred and the rate is decreased in proportion to development.

It is, of course, unnecessary to stress the importance of final finish on a pullet which means having them in excellent physical condition with sufficient reserve to continue producing without interruption after having started.—J. B. HAYES.

Poultry Feeding Experiments with Soy Beans

Bulletin 147 of the Delaware Experiment Station by A. E. Tomhave and C. W. Mumford reports the results of two experiments as follows:

Soy beans for baby chicks.—Three pens of 350 chicks each were used for comparing protein supplements of meat scrap and dried buttermilk, ground soy beans and dried buttermilk, and ground soy beans. At 7 weeks of age the average weights of the males and females receiving the two types of animal protein were 1.020 and 0.957 lbs., while those receiving ground soy beans and dried buttermilk averaged 0.860 and 0.740 lb., and those receiving ground soy beans as the only protein supplement averaged 0.433 and 0.557 lb.

Ground soy beans in the ration for laying pullets.—Preliminary results of a comparative test of meat and ground soy beans as protei plements in a mash of laying showed that those receiving scrap laid larger numbers of eg consumed considerably more fe

Ten Years with Dairy

(Continued from page 883)

"You seem to be doing a go of it," we remarked. "What feed during the winter?"

"I feed silage twice a day, a will eat. I feed alfalfa or clov three times a day all they will make a grain mixture of groun ley, ground oats, ground corn and either linseed meal or feed. Right now it is gluten fe cause I am in the gluten feed c I feed this grain mixture 1 pou 3 pounds of milk produced. I aim to let a cow go down beca lack of feed. If I feed her rig then she don't make me a profit her and feel that I have bee with her. If I should not fe cows enough of the right ki feeds and they did not produc I think they ought to produce, my fault and not the cows' fau

"Your pastures are pretty burned up right now. What a doing to hold your cows up in p tion and flesh?" we asked.

"I am feeding grain," he

"Have you ever tried sweet for pasture?" we asked him b of finding out what his plans for solving the midsummer p problem.

"No, but I am surely going it. Right now this whole cou in bad shape because of these up native pastures. We've got something and sweet clover see be the answer."

Mr. Guildner's herd is now fifth year in the cow testing a tion. It costs him a flat rate a year. He said he could aff pay $100 a year rather than b out the knowledge gained t this work.

He hopes some day to have of pure-breds. What he ha with grades makes quite a ch to pure-breds. He will have of pure-breds and they will b ones because he will deman they make money for him. He how to find out how good th In fact his trump card is k how to make a real cow out someone else has failed with partly accounts for the produc is getting from grades.

In counting the difference b income and expenditures, M Mrs. Guildner are counting t when they will have a better and barn, a better herd of more comforts for themselve quate education for their c and a lasting satisfaction in k that they have done a hard p work in a successful way.

Increasing the Effectiveness of Corn and Tankage

As a rule, winter rations for pigs are deficient in vitamin factors affecting growth and health. The Ohio Station has carried through several experiments to find out how these deficiencies may be corrected. A brief summary of some of this experimental work is reported as follows:

Limestone.—In the fourth experiment of a series dealing with the problem of increasing the effectiveness of a corn and tankage ration for winter feeding, 1½ per cent of limestone in the ration failed to improve it. Calcium carbonate was used in one of the four trials. A summary of the three, in which limestone was used, shows the addition of limestone to have increased the rate of gain 17.4 per cent, and to have lowered the feed cost 12 cents for each 100 lbs. of gain. A ration of corn and tankage is thus apparently slightly deficient in calcium for optimum growth.

Skimmilk.—The possibility of improving the quality of the proteins of a corn and tankage ration was suggested by the favorable results again secured by replacing a part of the tankage with a little skimmilk in a ration of corn, tankage, salt, and limestone. Much larger returns were secured for skimmilk when it was used in this manner than when it was fed as the only supplement.

Cod liver oil added to yellow corn, tankage, salt, and limestone at the rate of .5 pound in each 500 lbs. of feed produced more rapid growth, as well as a larger amount of growth from a given quantity of feed. Cod liver oil that had been treated to destroy its vitamin A content gave results similar to those from the untreated product. Pigs on yellow corn and tankage seldom show symptoms of rickets, nevertheless it seems probable that these feeds are too low in the anti-rachitic property for optimum development, although not appreciably deficient in vitamin A.

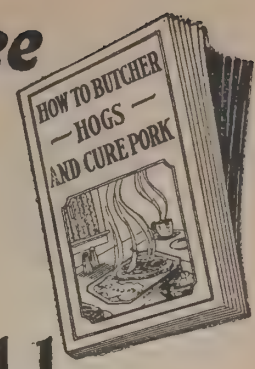
Alfalfa meal is regarded as a more practical feed than cod liver oil for swine. The mixture of tankage 2 parts, linseed meal 1 part, and alfalfa meal 1 part, again made an excellent showing. In this trial it gave cheaper and more rapid gains than a supplement of tankage only, or one of tankage and limestone. Limestone with tankage, linseed meal, and alfalfa meal did not reduce the cost but did still further increase the rate of gain. Linseed meal and limestone made a less effective supplement than the same feeds with alfalfa meal included. Bright green, third-cutting alfalfa hay was tried as a possible substitute for alfalfa meal. It was readily eaten, particularly during the early part of the test, and proved as efficacious as the alfalfa meal which also was of excellent quality.

Direct sunlight apparently has a beneficial effect upon growing pigs receiving certain rations. In one test two groups of pigs were given corn, tankage, linseed meal, salt, and limestone. One of these groups was confined indoors, the other housed and fed indoors but given access to a small outside pen with a board floor. The pigs having access to sunlight made the more rapid and economical gains. The difference in favor of the pigs having access to the outside pen was not great at first during the cloudy days of winter, but became more marked as spring advanced and there was a greater amount of sunshine.

Fermenting a ration of corn, tankage, salt, and limestone, and one of the same feeds plus linseed and alfalfa meals resulted in a little more rapid growth, and in slightly greater gains from a given amount of feed, but the saving was not sufficient to cover the extra cost when commercial yeast was used. Practically the same results were secured with self-propagated or home-grown yeast, but despite the fact that this method involves practically no expense it is doubtful whether the benefit derived will ordinarily pay for the extra labor required. A ration of yellow corn and tankage is apparently not deficient in anti-neuritic properties.

Milk and Coffee Drinking Survey

(Continued from page 882)



throughout the day in exactly the same manner as did the children of the larger groups previously discussed; that is, more of both the better class children and poorer children had milk for lunch than at any other time; more of them, rich or poor, took coffee for breakfast than for lunch or supper, and supper was the meal at which the least number of each of these two groups had either beverage.

"Every dairyman should weigh carefully these facts relative to the milk and coffee consumption in this community," states P. S. Brenneman, President of the Dairymen's Co-operative Sales Company, Inc., the milk producer organization in the Pittsburgh territory. "This information shows up more strikingly than ever before the need for more education among the public relative to the value of milk for physical health and mental ability. It points out our responsibility as an industry to the welfare of the children of our country and offers us an opportunity of increasing the net profits of the dairymen by teaching the public to use more milk in the fluid form."

A pamphlet containing more complete results of the survey together with charts picturing important findings may be secured upon request from the National Dairy Council, 910 South Michigan Avenue, Chicago.

"Make the best of everything; think the best of everybody; hope the best for yourself."—GEORGE STEPHENSON.

Free

A booklet -you need

ARE YOU butchering this fall? If you are, write today for a free copy of the booklet, "How to Butcher Hogs and Cure Pork." You will find it's the most helpful thing you ever read on the subject of "putting up" meat.

It tells you the best and easiest ways to butcher, how to prepare the carcass, select the various cuts, cure the meat. It explains thoroughly the importance of salt in meat curing—and why Diamond Crystal is and for 40 years has been the ideal salt for curing meat.

Diamond Crystal is pure, mild salt. Used in curing, it assures sweet, well-flavored meat. The tiny flakes, which dissolve quickly, penetrate every fibre and thus protect against spoilage.

There is a Diamond Crystal Salt for every farm use—for curing meat, for livestock, for canning, for butter and cheese making, for table and for cooking. Ask for Diamond Crystal at the store where you trade.

"The Salt that's all Salt."

alfa Pasture Saves Money

(Continued from page 907)

cow in August, plus $1.80 for 3.1 fat, a gain of $2.25 per cow.

A. Hart, owner of the herd in Richland Association of Wisconsays he can grow alfalfa on every e of land on the farm and he sure that no farmer can grow much alfalfa. When bluegrass , alfalfa or sweet clover pasture keep cows in good condition with grain and still maintain continual uction.

ne Richland Calf Club made a t showing at the county fair. nty-eight calves were exhibited as individuals, condition, train- and showmanship were equal to ig shows. In the open classes of rge a show of cattle as ever exenced in Richland County, the club won five firsts, a junior champion, one second, and two thirds. Calf club work has made a hit with the members of the association. PETER NELSON, Tester.

Feed Market Situation

(Continued from page 900)

ers and sellers rather widely apart in their ideas of prices.

Tankage quotations were unchanged. Demand at Chicago seems to be in rather small lots but inquiries were reported from a wide territory and the market appeared firm, offerings removing readily at Missouri River markets.

Calf Scours

Abortion

Retained After Birth

CALF SCOURS is easily prevented and controlled by disinfecting new-born calves with dilution of B-K, and feeding them a little B-K. Get our book on Scours.

For removing **Retained Afterbirth** B-K in warm water loosens adhesions, stops inflammation, prevents fever and odors. The afterbirth comes away naturally; the parts are restored to health.

Abortion is caused by germs of several kinds. What they are and what can be done in prevention and control is told in our book.

B-K is Concentrated

you add water to use, the dilution costs

Only ½ to 2c a Gallon

The germ destroying power of B-K is 10 times greater than that of undiluted carbolic acid. B-K destroys germs by chemically dissolving them, yet B-K contains no poison, or acid, and leaves no odor.

B-K represents 15 years of scientific work. It is made by our exclusive process, producing the only stabilized hypochlorite ever approved by the American Medical Association.

B-K is dependable. Your money back if not satisfied.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

The Bleeding Bull

It occasionally happens that bleeding takes place from the urethra of the penis just after service. The bleeding may be slight, coming in drops or little dribbles; but sometimes the blood flows freely and the hemorrhage continues for some time. We have even heard of a case in which the bleeding proved persistent, could not be stopped by treatment, and eventually caused death. The bleeding, no doubt, is due to rupture of a small blood vessel during engorgement of the penis with blood. In most instances we think the blood vessel is located in the penis, probably close to its free end, but in some cases the blood comes from the prostate gland, or possibly from the bladder. Overservice may be the cause. In one case, recently reported, the bull had been used for service from the time he was 9 months old and was, at the time, being used almost daily in a large herd. One or two services in succession were allowed, which is a serious mistake. It is also inadvisable to use a bull for service before he is at least 18 months of age and when he is used at that age he should not be allowed to serve more than 8 or 10 cows, or give more than one service at a time of heat.

Not only does too early service tend to cause partial or complete sterility or impotence; it may weaken the generative organ and make bleeding more likely to occur from rupture of a blood vessel. Overservice is even more likely to have that effect, as the blood vessels of the organ become distended, sometimes varicose, and in time have their walls weakened to such an extent the rupture readily occurs during engorgement. Judicious use of the bull is advisable both as regards the effects of service on the cows and the effect of it upon the bull. Light service during the early years of life conserves the powers of the bull, enhances his powers of procreation, insures stronger progeny, and keeps the animal fertile and potent for many years.

When bleeding occurs after service and is not found to be due to a superficial wound which is readily healed, the bull should be retired from service for at least 2 months and during that time should live on a light, laxative ration and take plenty of outdoor exercise, away from the cows, on every fine day. Treatment to stop the bleeding should consist in the application of cold, wet compresses to the small of the back and at the same time cold water should be continuously applied along the course of the penis. Cold water may also be injected into the sheath. If the penis is prolapsed and pendulous it should be supported with a bandage around the body and be kept saturated with cold water and vinegar. At the same time the veterinarian will give internal treatment with a drug that has the effect of constringing the blood vessels and stopping hemorrhage. Ergot is generally used for that purpose.

Warts on Teat

I have some pedigreed heifers with warts massed on teats, some large. These are so closely connected to teat that it is not possible to cut or tie. Is there something I can dress same with which will not harm teat?

Blandford, England. J. T. Y.

Masses of small warts will come off in time if the teats are immersed twice daily in warm water containing one tablespoonful of washing soda per cup or frequently are bathed with the solution. We also advise covering the affected parts each evening with a thick paste of cold-pressed castor oil, salt, and flowers of sulphur. Oil of white cedar (Thuja), or an ointment of it, is also effective for the removal of such warts.

Moldy Silage

I lately read complaints concerning silage spoiling in cement blocked silos. I have had a similar experience. Our corn in 1925 was frosted before it was quite mature. We put it up promptly with great care in wetting and packing it down. We ceased feeding the ensilage January 15, 1926, and resumed feeding in November, 1926. We have found that there is irregular molding all the way down and very little of the silage looks as it should.

We have fed this silage to the cows and one of them happened to get sick at this time about the last of April. We had another die about the same time with what the veterinarian said was milk fever; a dead calf was removed from her.

May I ask if molded silage may be fed with reasonable safety in moderate quantities or if it is always toxic and dangerous?

Chicago, Ill. C. G. B.

Moldy silage must be considered possibly dangerous, as it may contain the germ known as *Bacillus botulinus* which causes botulism. Often it has been fed, however, without apparent harm to cows, but one never can be sure that that will prove true. It is considered most dangerous for horses We have had no experience in feeding it to hogs. Dr. Robert Graham, veterinary pathologist of the Illinois Experiment Station, at Urbana, has done special research work on the subject and has published an instructive bulletin on botulism which should be studied. He also prepared an antitoxin which is fairly effective as a preventive of botulism and has also some curative value. If fed at all, the damaged silage should form but a small part of the ration along with sound roughage and concentrates and even then we cannot guarantee that it will not prove injurious.

What is a Heifer?

At what age does a heifer become a cow or is recognized as a cow?

West Salem, Wis. W. T.

It is usual to apply the term heifer to the female of the bovine race up to breeding time and until maturity at four years of age when the animal becomes a cow.

Right on the Center of the Stage —

is the Ayrshire. At county, state, and national fairs these cattle are the center of attraction.

This is a personal invitation for you to visit the Ayrshire exhibit at your fair. Go look over the cattle, see the champions, and actually put your hands on them. Study the big, strong cows with their square udders, and remember that they are not unlike thousands of other Ayrshires owned by real dairy farmers, who depend upon their cows for a living.

Talk to the owners of these herds. They will be glad to meet you. Don't be afraid to ask for information and prices. Almost every herd has surplus animals for sale; you will be surprised how reasonably they may be bought. If you can't get what you want from the exhibitors at your fair, or if you wish for further information, write to

Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.

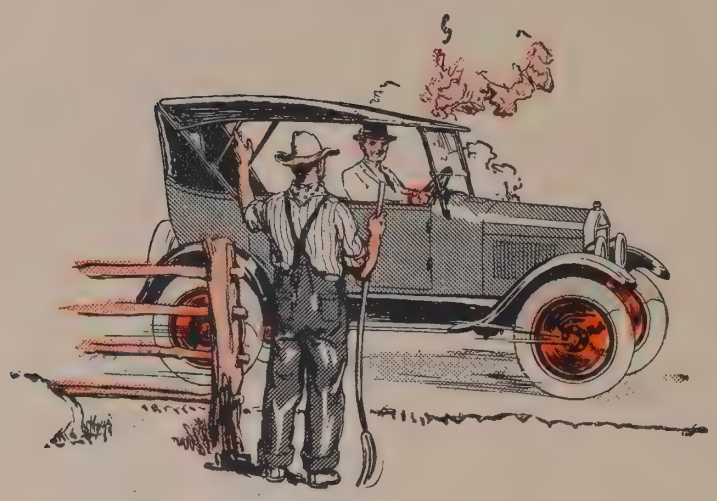
FLINT ONA HENGERVELD SEGIS

OUR JUNIOR HERD SIRE

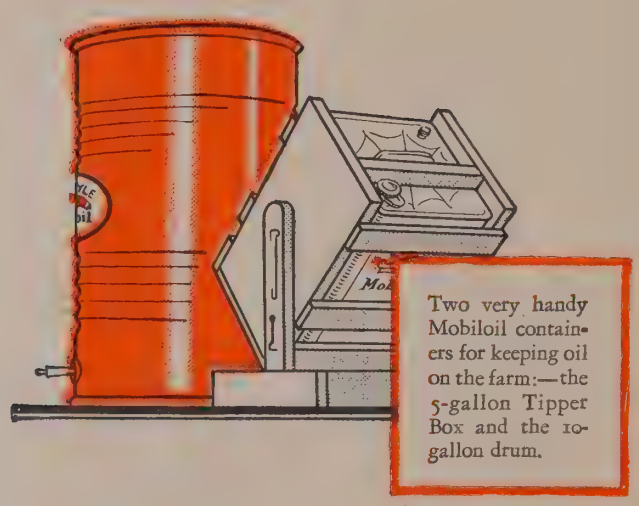


has the best of type and productive breeding and already has a very nice list of A. R. O. daughters. He is by King Ona and from Clover Farm Mercena Segis, a granddaughter of King Segis that has 4 records over 30 lbs. and 950 lbs. butter in a year. We have YOUNG SONS of this sire from daughters of Maplecrest Korndyke Hengerveld FOR SALE.

LAKEWOOD DAIRY FARM - BATTLE CREEK, MICHIGAN

STEELE COUNTY HOLSTEINS are noted for their size, type and production. Pure-breds or grades. One or a carload.
GEO. S. KAUFMAN, Sec. NELS P. GRASS, Pres.
OWATONNA, MINNESOTA

AKONA HOLSTEIN FARM
BULL CALF born Nov. 24, 1926. Sire's dam 1,024 lbs. butter in year. Dam's cow testing association record 421 lbs. butter in 10 months as a jr. 3-yr.-old. Price $100. Accredited herd.
B. A. NORRIS, Anoka, Minn.



New Ford economy – through quieter, smoother starts – and lessened carbon

During the past few months countless Ford owners have discovered these two things (1) Today's Gargoyle Mobiloil "E" brings new smoothness, new comfort to Ford starting and stopping; (2) the new Mobiloil "E" leaves *amazingly* little carbon. And no other lubricating oil seems to combine these *two* advantages in such a marked way.

It was only after a way had been found to combine these two qualities in one oil that the new Mobiloil "E" was offered to Ford owners.

Thus the new Mobiloil "E" offers two definite economies in Ford operation

Two very handy Mobiloil containers for keeping oil on the farm:—the 5-gallon Tipper Box and the 10-gallon drum.

It costs money to remove carbon. It costs money to replace transmission bands. With today's Mobiloil "E" you greatly postpone *both* of these expenses. Thus Mobiloil "E" is the cheapest Ford lubricant to use. Its slightly higher price is returned to you many times over by these definite savings.

There are other savings, too. The new Mobiloil "E" has just the right character and body to protect the Ford engine, clutch and transmission. Wear is substantially reduced. Repair bills are held to the minimum. Overheating is a rarity.

Proof in one crankcase full

Four quarts of the improved Mobiloil "E," when poured into your crankcase, will show you new smoothness in Ford starting and stopping.

As the mileage rolls up, the cash savings from the improved Mobiloil "E" will roll up, too. Fewer band replacements, fewer carbon removals, and fewer repairs to pay for. Have your Ford crankcase drained and refilled with one gallon of fresh Mobiloil "E," which can be obtained in original sealed one-gallon cans, or by the quart from reliable Mobiloil dealers. Also supplied in larger cans and drums for home supply.

Use Mobiloil "E" in your Ford car and Ford truck the year round. In Fordson tractor use Mobiloil "BB" in summer and Mobiloil "A" in winter. Ask the Mobiloil dealer what grade of Mobiloil to use in cars, trucks and tractors of other makes. All Mobiloil dealers have the complete Mobiloil Chart of Recommendations.

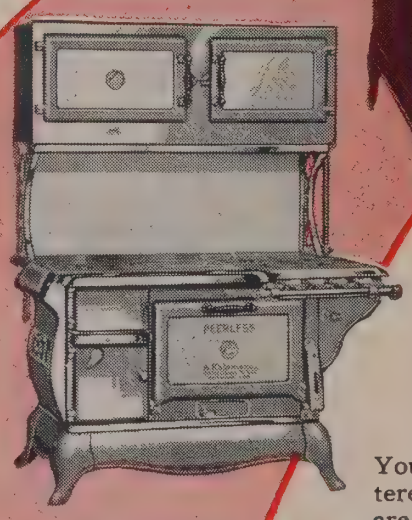
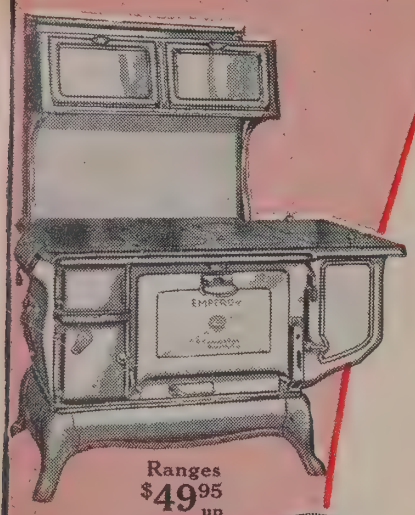
650,000 Satisfied Customers Have Saved ⅓ to ½ by buying Direct from Kalamazoo

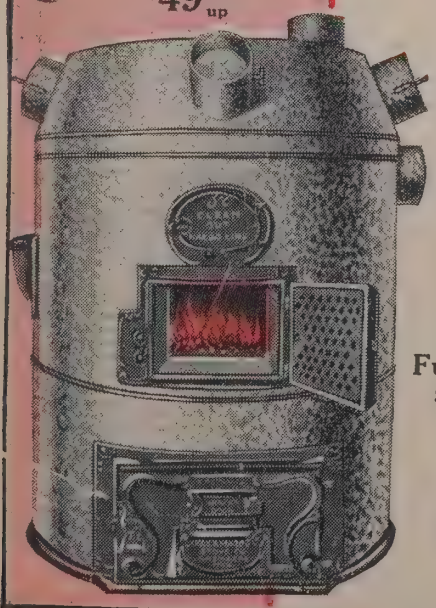
W. S. DEWING
President



Gas Stoves $25.80 up



Heating Stoves $24.95 up



Combination Gas & Coal Ranges $71.50 up

Ranges $49.95 up

Pipe or Pipeless Furnaces $59.95 up

Reduced Factory Prices

Five Year Guarantee of Quality

650,000 customers — one out of every 35 families in the United States. They are not only Kalamazoo customers — they are *satisfied Kalamazoo customers*. That's the important thing — *satisfied customers*. And think of this: they are increasing at the tremendous rate of more than 50,000 *new* customers a year. Could anything more clearly or concisely prove Kalamazoo quality! Could anything more convincingly or conclusively prove that Kalamazoo is saving customers ⅓ to ½ by selling direct from factory to user.

Get Your Copy of this New FREE Book

Your FREE book is ready — alive with interest, full of new features. Reduced prices are in effect! A new 5-year quality guarantee is in force! See the Beautiful Porcelain Enamel Ranges in beautiful delft blue and pearl gray — the very latest and most popular of all ranges. Look for the Mahogany Porcelain Enamel Heating Stoves — the most popular of all heating stoves. Read about the new Hot Blast, improved fire box — more heat from less fuel, a clean fire without smoke or soot. See the latest improvements in warm air furnaces — pipe and pipeless.

200 Styles and Sizes

No matter what you are interested in — gas stoves, coal and wood ranges, combination gas and coal ranges, oil stoves, heating stoves or furnaces (pipe or one-register type) — you will find here exactly what you want. Mail coupon today.

Quality First — Values Unexcelled

Kalamazoo values cannot be equalled anywhere. When you buy from Kalamazoo you buy direct from manufacturer. There is nothing between you and our factory — but the railroad tracks. We are not a mail order house that collects a variety of merchandise from scores of factories to sell by mail — we are *specialized* manufacturers, making Kalamazoo stoves, ranges and furnaces complete in our own highly modernized factory and shipping direct to you, thus eliminating any other manufacturer or middleman of any kind. We build in large quantities. You get better quality at lower prices from a factory whose sole interest is making stoves, ranges and furnaces than elsewhere. This new catalog proves it. Fill out coupon for your copy.

Saved $80 to $100
I put up the furnace in a very short time. I saved from $80 to $100 on what it would cost me here. Am more than satisfied.
John Fischer, Warren, Pa.

Quality Baker
Stove works perfectly. Stoves costing $175 could not begin to compare with it in fuel economy, baking quality and in heating performance. Wm. Rock, Rochester, Minn.

The First Silo

It is always dangerous to say that is person or that person was first to a certain thing, as we have found t by sad experience many times. ıe mere publication quickens mem- y and lets loose the flood gates of nflicting belief and testimony.

Some few months ago we credited ancis Morris of Maryland as the st man to build a silo in America, having done so in 1876. This im- diately brought a correction from number of sources asserting that ed L. Hatch of Illinois built a silo August, 1873, and so far as known is the first person to use silage in United States. Mr. A. L. Haecker nds us the following account, which in turn secured from the Prairie rmer:

"I don't believe anybody knows who ilt the first silo, for undoubtedly process has been known for a ıg time. Some claim that Caesar siled green grasses and forage in ul to feed the horses and cattle of conquering armies. I have heard at the ancient Egyptians knew of process of fermenting green for- e in a pit and thus preserving it. lam might have used a silo wherein kept his cane (Cain); Joseph ght have been put in a pit silo; d probably if the Israelites had ed more of them they would not ve been driven into Egypt on ac- ınt of a famine.

"Fred L. Hatch of Spring Grove, Henry County, Illinois, built a silo August, 1873. This, so far as the iter knows, was the first silo built the United States. Mr. Fred Hatch is a student in the University of Il- ois from 1870 to '73; and while at- ıding this institution Professor iss translated French and German mphlets treating the subject of ıking and feeding silage from een forage. These early French d German silos were all in the rm of pits.

"Mr. Hatch's silo was built of wood, x16, and 24 feet high. It was con- ructed inside of the barn and had a ; 8 feet deep that was laid up with ne and mortar. The boarding was good flooring, which naturally kept e silo tight. Mr. Hatch explains at the silo was filled the first year th corn well in the dent. It was t up into two-inch pieces, run in d thoroughly packed. Mr. Hatch es on to relate that they fed with ccess this silage to a large herd and re greatly pleased over the results.

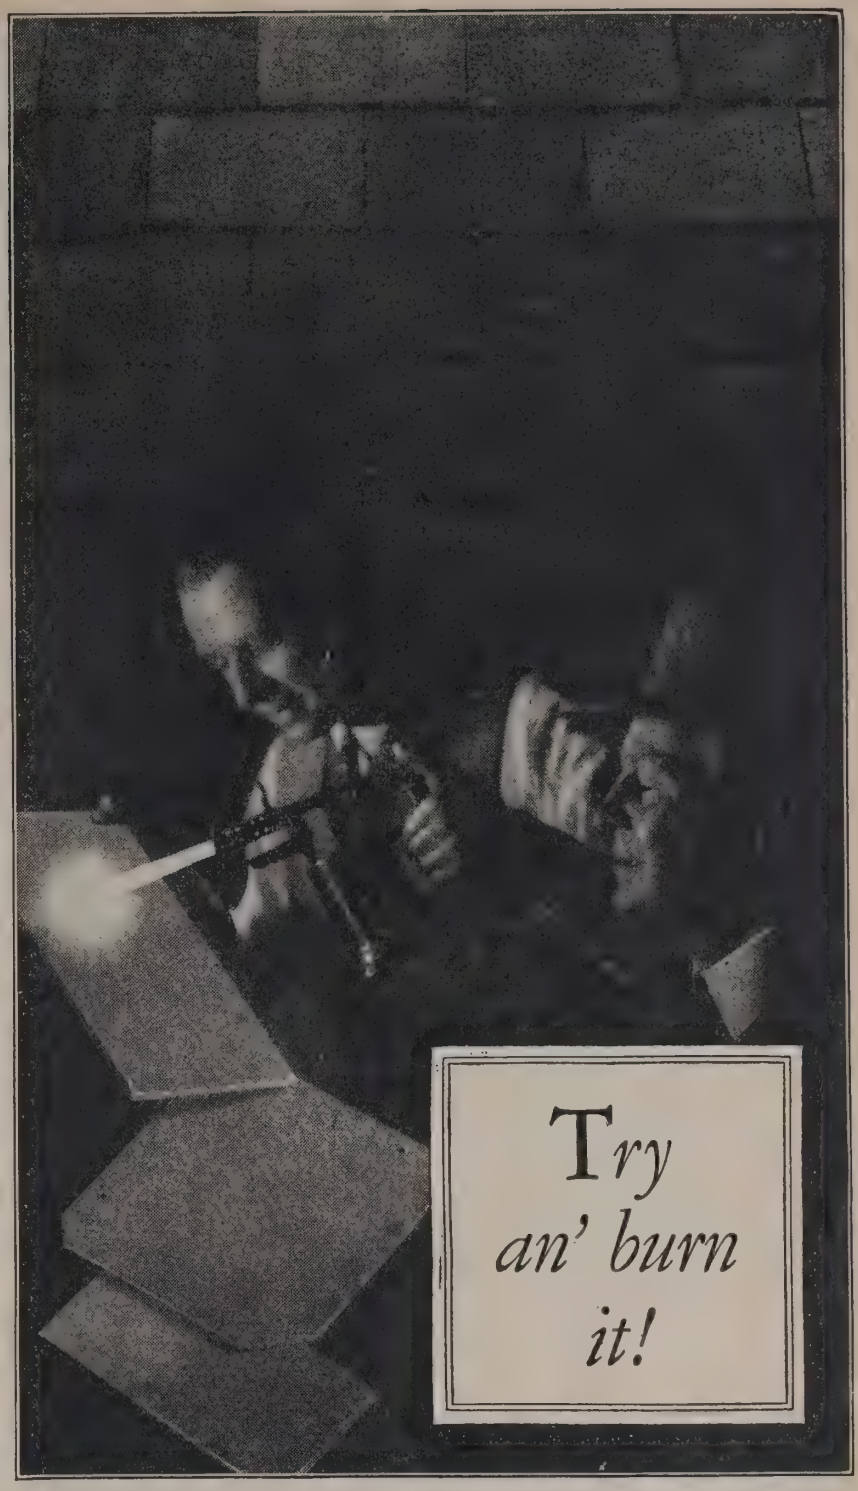
"The book written by August Gof- rt of France was one of the early ritings concerning the silo and its e. Other writers, such as S. Jones England and A. Reihlen of Ger- ıny, treated the silo and told of its ocess and use. These books appeared ring the period of 1860 and '75.

"Mr. Levi P. Gilbert of Ft. Atkin- n, Wis., built a silo during the sum- er of 1877. Mr. Gilbert's silo was ally a trench silo, for he dug it in e ground, making it 6 feet wide, 6 et deep, and 30 feet long. This was obably the first silo in Wisconsin, d the first trench silo in the Unit- States. Mr. Gilbert got his idea om the Frenchman, M. A. Goffert. the late seventies—that is, from to '79, the silo was talked in many the states, and in the University of nnessee they experimented with os in '79 and '80.

"Much credit is due the early agri- ltural workers and teachers of Wis- nsin for making the silo popular. ıch men as L. P. Gilbert, W. D. ɔard, W. L. Weeks, John Steele, and ıny others were early silo builders ıd advocates in Wisconsin. Profes- r Henry, coming to the state in the rly eighties, at once took up the cause of the silo and with Professors King, Gurler, and H. Smith, it was described and promoted. It soon gained favor, and Wisconsin has led in silos from this early date. They now have at least 50,000 more silos than any other state in the Union, probably with a grand total of close to 109,000."

Kinds of Milk Powder

There are two general types of milk powder on the market. One is known as the spray process powder and the other as the hot roll powder.



The spray process powder is made by spraying the milk under great pressure into a heated chamber. It enters this chamber in the form of a mist, and before it reaches the bottom has been converted into a very fine powder. It costs more to make this form of powder, and it is said to be at least 98 per cent soluble in water. As a rule it is this type of milk powder that is used for human food, especially in making ice cream and bread.

With the other type of powder, the milk is dried on a hollow steam roller that is heated by steam. As the roller revolves through a trough of milk and after it reaches the upper side, the dried milk is scraped off from the roll and the sheet of powder that is scraped off has much the appearance of a lace curtain. This breaks up very easily as it runs through a device known as a flaker, before being put in sacks. This type is only about 60 per cent soluble in water, which makes it less desirable for human food, but it is quite suitable for feeding live stock.

The Twin City Milk Producers' Association states that many of its members buy the hot roll powder for use in feeding calves and poultry. They state that the fact that it does not all dissolve in water does not make any material difference, as it will stay in solution long enough so that the calves will get all of the powder. It is believed that it is just as digestible as the other type, and the fact that it costs less makes it more practical for stock feeding.

A Scotchman was discovered wandering around Detroit with a pair of rumpled trousers over his arm. "Can I help you in any way?" asked a kindly citizen.

"Man," replied the Scot, who was evidently a newcomer, "I'm looking for the Detroit Free Press."

New glories of color, shape and texture

grace these fire-proof *shingles*

Colorful new asbestos shingles cloak your roof with beauty as they guard it against the menace of flying sparks and the onslaughts of weather and time.

They are not expensive. Rich velvety blue-black shingles, soft mottled reds, cheerful variegated colors, or dignified grays, now available, at costs that compel their selection. Choose these shingles in the shape and texture you most prefer. They will reward you with beauty, fire-defense, and everlasting service. They cannot wear out.

Re-roof for the last time

Leave the old roof on. Lay these beautiful everlasting shingles right over it. No fuss, no dust, no litter, no danger from rain while the work is in progress.

Then forget your roof. It will be everlasting—no costly repairs. It will be fire-proof—you need never fear flying sparks. You re-roof for the last time when you re-roof with Johns-Manville Rigid Asbestos Shingles.

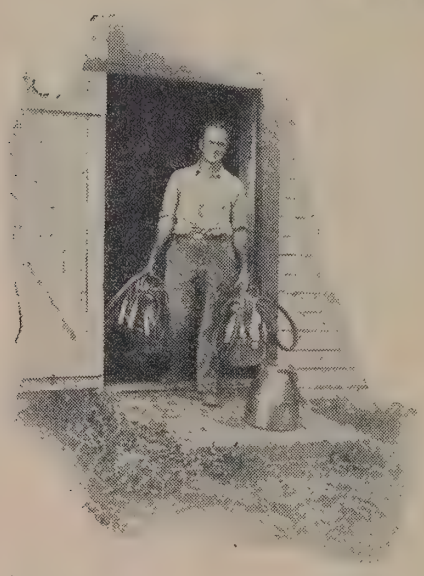
BROWN'S BEACH JACKET COMPANY
Worcester, Massachusetts



You need a Vest Pocket Herd Book

Wherever better milking, more and cleaner milk are sought after, the De Laval Milker is chosen

Three high-producing individuals from the notable purebred Jersey herd at Bridgford Farms, owned by C. W. and L. C. Bridgford at Joy, Ill. They say, "We milk from 35 to 45 head of purebred Jerseys and always have a good word for the De Laval Milker. Our De Laval milks fast and clean. The writer has milked 45 gallons from 26 cows in 47 minutes with three units and has at different times weighed the milk from the machine. The individual records and herd averages indicate that the De Laval is a real aid to greater production. Three of our De Laval milked cows have each in the last year set new 305-day records for R. M. cows in Illinois."

The De Laval Milker Helps Good Cows Make Better Records

Mr. Scott H. Hammond, owner of a splendid purebred Ayrshire herd kept at Overlook Ayrshire Farm at Brandon, Vt., writes, "My cows are all milking well, two-year-olds giving between 30 and 35 lbs. daily while the best cow has given close to 75 lbs. in one day. Since using the milker I have not had one complaint from the milk station regarding the bacteria count. My customers are profuse in their praise of 'Clean Ayrshire Milk.' I want to assure you that the De Laval Milker has been far more than a 'hired man.'"

THE best of cows need the right kind of handling and care in order to reach the peak of their production capacity, and as every breeder and dairyman knows correct milking is of the utmost importance. Owners and herdsmen seeking maximum production know that the milking operation must be pleasing to the cow. must be uniform, gentle, and unchanging in speed and manner day after day, if the best possible records are to be made.

These are some of the reasons why so many noted herds are milked with the De Laval Milker, for no other method of milking affords in a comparable way the uniformity, regularity and dependability that is of such vital importance to the cow on test or to the cow who must pay for her place in the dairy herd.

Hundreds of De Laval Milker users attribute a large portion of the credit for their high herd averages and individual records to the De Laval — and they regard its sanitary features of real value in keeping bacteria counts consistently low.

A postcard will bring the nearest De Laval representative, who will gladly go over your milking problem with you without obligation of any sort.

Mr. Harvey Firestone, the noted rubber manufacturer, has assembled a splendid herd of purebred Holsteins at his beautiful farm at Columbiana, Ohio. A De Laval Milker is used exclusively to achieve and maintain maximum production and to facilitate the production of a low bacteria count milk. Mr. Harry Chadwick, the manager, states that the results obtained with the De Laval far exceed those obtained by hand milking.

Mr. Geo. E. Sutton, superintendent of Audley Farms at Mendham, N. J., home of a well-known purebred Guernsey herd, says:

"We have used the De Laval Milker for the past five years and feel that very much of our success in largely increased production during that time must be attributed to its use. Its absolute cleanliness goes far, both from the sanitary and time-saving viewpoints."

PUTTING VAGRANT ACRES TO WORK

I. J. MATHEWS, INDIANA

AGRANT acres are the bane of a well ordered and profitable farm. And keeping these idle es at work and the whole farm ducing is a job in itself. The ual observer may think that there few vagrant acres on farms and t all the plow soil on most farms nder production, but such is far m true. Every farm has its lazy es that constitute a load for the le enterprise to bear.

When we bought Mathews Manor m, it was barnacled with several ieties of vagrant acres l utilizing them was one the first jobs I tackled. t and how to get and p the whole farm in pro- tion has been a very en- ing study. And this year he first in five that all the ds will render an account themselves.

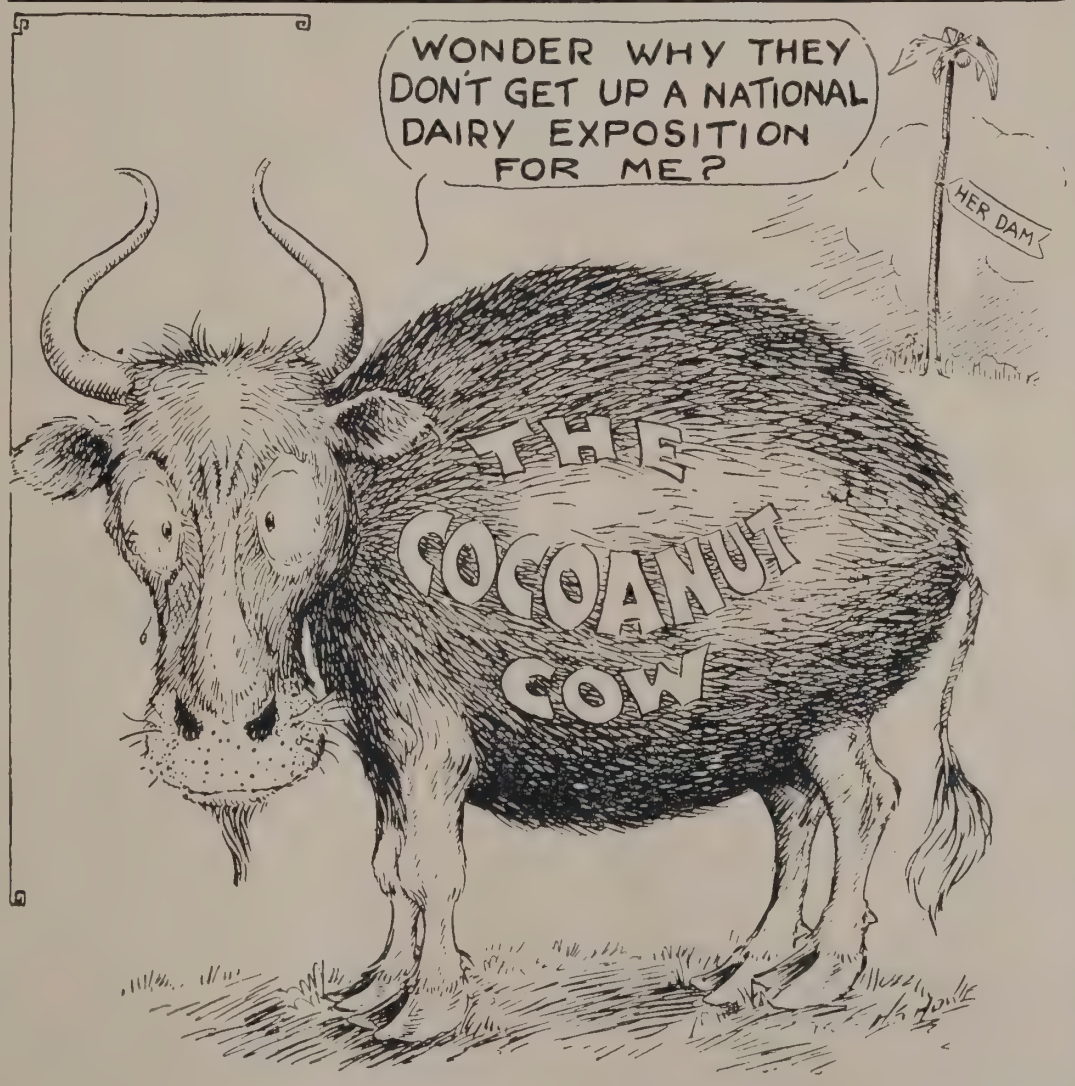
ence rows are the most mon offenders as vags. ny farms are fenced into small fields. I always ught that the ideal farm s one divided up in small ds, but during the last five rs I have kept a detailed l accurate account of cing costs. I now know t the easiest way to keep n fence overhead per e is to have large fields— hing less than ten acres l thirty is better. What if t do only have hogs ugh to eat off five acres alfalfa? Turn them into thirty-acre field and cut at they don't eat. They y tramp some down, to be e, but it isn't lost by any ans and the loss is small npared with the yearly of the cost of fencing many small fields.

When we bought this m, it had 185 rods of use- s fence and a hedge row t I immediately set out to laim. The fence rows had wn up to a tangle of sh, grape vines, small es, and nettles. Cleaning m was tedious business by throwing a 17-acre d with a 20, we have 37 es all in one field. And en we got into that field with the -row corn plow, we sure cut off ne territory every round. The first r after clearing this off, the com- ed two fields were in corn and I enough corn off that fence row to r for digging the brush, and it was best corn in the field. That fence y took up more than an acre that l always before gone vagrant.

hen there were 85 rods of osage nge hedge. As it grew, the owner l backed off until it had appropri- d the fertility and space about nty feet on either side. I shall not soon forget the task of cutting these hedge tops and pulling out the roots. This old hedge row took up about an acre and a quarter; now the space is in alfalfa. Last year it made more than three tons of $20-hay, so I was more than repaid for the work of grubbing that old fence row.

Wet spots in the fields where the plants drown out are too often a total loss. Water covers them in the spring and nothing but weeds grow on them all the rest of the season. When one seeds these, especially to alfalfa, the seeding here will not persist. These spots should be tiled, but I believe almost any economist will bear me out when I say that tile have been too high when it is considered that they are a 50-year investment and will have to pay for themselves with produce that will undoubtedly trend lower in price. So when I seed my alfalfa, I do not allow these wet spots to just clutter up the field. When I get through sowing, I make up a mixture of about equal parts orchard grass, timothy, sweet clover, and alsike clover and go round and round. The first two of these will stand a good deal of submersion and still make a lot of pasture or hay. I think a great deal of orchard grass, ranking it next to alfalfa and sweet clover on this farm.

Then there were two spots on the farm that were just too wet to grow any kind of cultivated grass. They had grown up to willows, and there is no money in raising willows. White ash, sycamore, and silver maple will stand a lot of water, so some small seedling trees were purchased and set in these spots that are so wet and naturally run to willows.



There are 80 acres of alfalfa on this farm and any man who grows alfalfa, especially if his farm is poor, finds it most successful to summer fallow his ground and sow his alfalfa early in August. This sounds good on paper but where a fellow is putting out 30 acres at a clip, he can scarcely afford to have a fifth or sixth of his farm out of production for a whole season. It is for this reason that I am getting away from summer sowing. I have found that if one has a fertile soil with some humus in it, seeding alfalfa with a nurse crop, barley or oats, is generally successful. And if it isn't, one has lost only his seed and there is yet time to prepare the ground after the grain is taken off.

The roadside adds vagrant acres to almost every farm and getting these to work remains a knotty problem. Of course, if there are both children and cows, they can keep track of each other and thus utilize some pasture off the road but I have always felt that the time required made this road pasture expensive feed. Along a gravel or limestone road, sweet clover will generally take root if sown right on the sod in the late winter. I have done this, and on the main traveled road the hay secured makes cutting the roadside less than a total loss and on the byroad we can harvest sweet clover seed which makes this pay better than almost any other part of the farm.

The barnyard is generally a bare spot although it is at the same time the richest one on the farm. We have no barnyard as such. We have found that we can best control parasites and diseases if we move the stock from one pasture to another and keep away from a permanent barnyard. Each year we rake seed in on the spots where the stacks have been on the fields, but the old barnyard is now a service court that produces its quota of alfalfa just the same as the fields.

Adding up, I find that we now have more than ten acres producing crops that were producing weeds and brush five years ago. In other words, we have added about nine per cent to the producing area on the farm simply by ridding it of its vagrant acres.

WHAT ABOUT ME?

Efforts to popularize milk as a beverage and as an item of food are being consistently made in Japan. We are just in receipt of a series of posters and publicity items issued in the Japanese language, similar to the publicity used by the National Dairy Council of the U. S. That this type of work is bearing fruit is indicated by the fact that milk production has increased from 26 million gallons in 1922 to 36 million gallons in 1926.

PRODUCTION AND USES OF MILK 1925-1926

Fewer Cows Produce More Milk In 1926

THREE and a third billion dollars is what the dairy industry contributed to the value of farm production in 1926. This is over a quarter of the total value of farm production, and the dairy industry is the biggest and most profitable branch of the farm business.

The dairy cow is on top with a production greater in value than that of the combined corn, cotton, rice, and barley crops. She supplies practically half the total value of all animals and animal products, and her products are nearly equal to the total value of all the grain crops. The farm value of her milk production exceeds that of all the gold dollars coined since 1886, and it is also in excess of the value of all automobiles and trucks manufactured last year as well as greater than the total output of the entire steel industry. These are the values of the dairy cow's product at the farm. They are not their wholesale value in the markets of the world. Consumers paid some five and a half billion dollars for these products.

Production of Milk Stupendous

Not only is the value of dairy products in excess of the production of any manufactured product, but the quantity of milk produced is stupendous. If the yearly production of over fourteen billion gallons were placed in milk tank cars, to transport it would require over eleven trains reaching across the 3,170 miles that separate New York from San Francisco. If placed in cans and transported in express cars, it would fill solidly twenty-three tracks between the Atlantic and Pacific oceans.

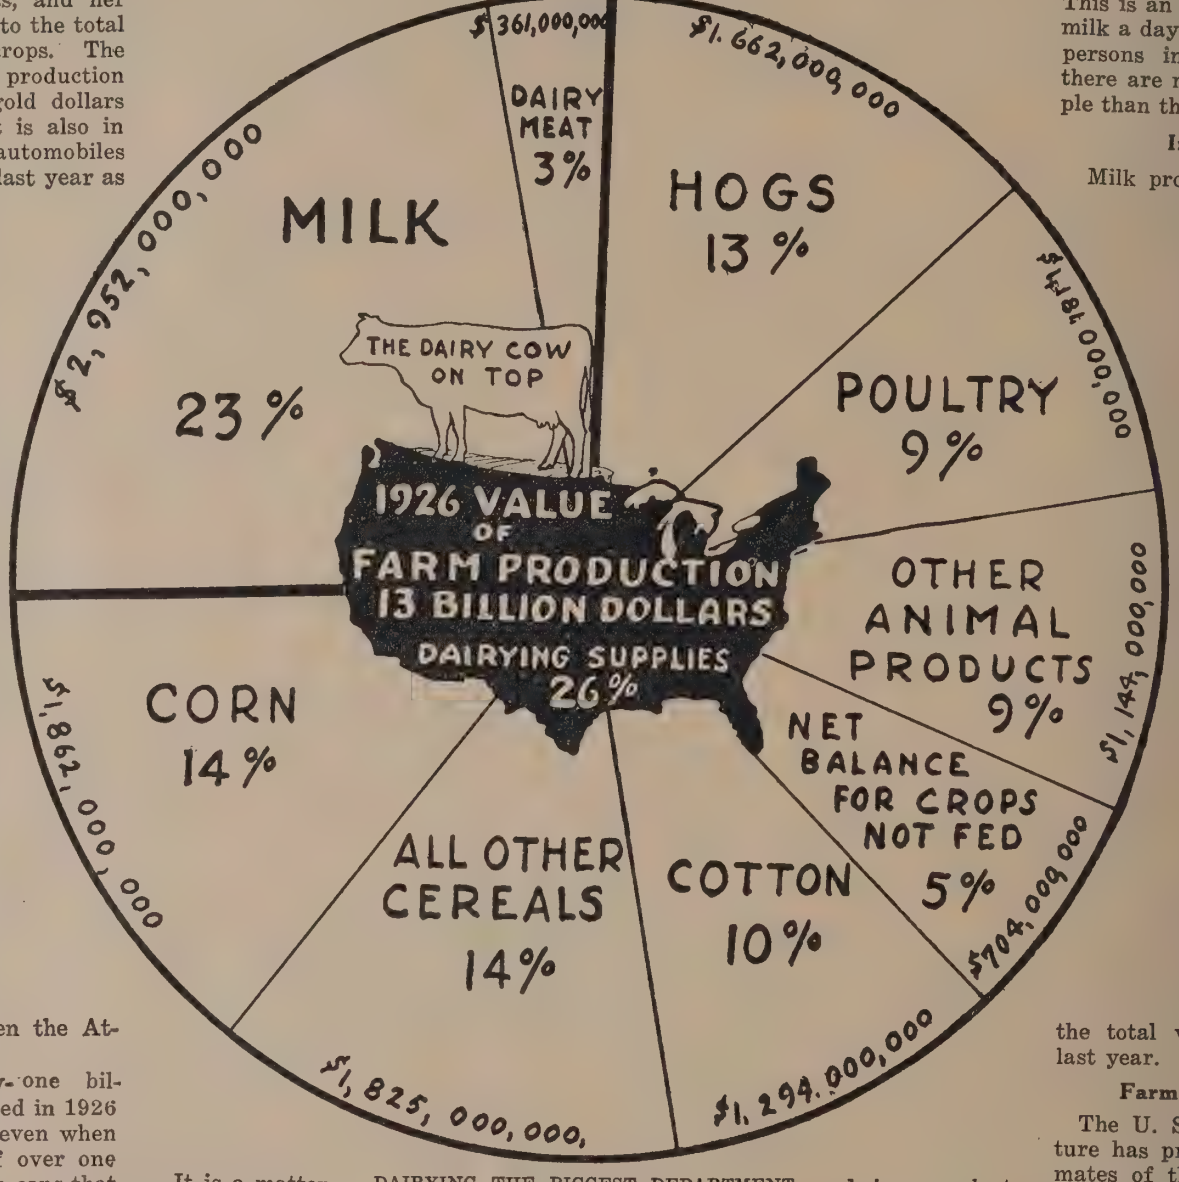
The one hundred twenty-one billion pounds of milk produced in 1926 is difficult to comprehend even when stated in its equivalent of over one and a third billion 10-gallon cans that placed side by side would girdle the globe fifteen times in passing from Chicago westward across the United States, over the Pacific ocean, through Japan, Asia, Europe, over the Atlantic, and then back to Chicago—a highway of milk sixteen feet wide and two feet deep going around this world of ours. Turned into a canal like the Erie Canal, this milk would float the commerce of the Mid-west from Chicago to the Gulf, with enough milk left over to fill a harbor that would float the U. S. Navy.

We see the huge tank cars of gasoline and the filling stations located at every crossroad, and marvel at this demonstration of the extravagance of the American people. Yet the dairy farmers of the United States produce a quarter more milk than the nearly eleven billion gallons of gasoline that last year were consumed by our automobiles, trucks, tractors, engines, and for other purposes.

The total production of milk for 1926 was over sixty million tons, or nearly two tons or 330 gallons at every tick of the clock during the the 24 hours of every day in the year.

Consumption Increases Fifty-one Per Cent

The consumption of dairy products has shown a startling increase, one that is gratifying to milk producers. In 1916 the consumption of milk and dairy products was equivalent to 37 billion quarts of milk, as compared with 57 billion quarts in 1926, an increase of over 51% in ten short years. the same time increasing population with no increase in number of cows has brought the number of cows down from 225 to 189 cows per thousand consumers, a decrease of 16 per cent.



This increase in consumption of dairy products has been brought about in part by an increase of 17% in the population of the United States in the past ten years, the yearly increase now being nearly two million people. Even more important, however, has been the effect of the increased per capita consumption of dairy products, an effect doubtless due to the improved quality of milk and the educational programs have brought before consumers value of dairy products in the Per capita consumption of milk manufactured dairy products in was equivalent to 484 quarts of an increase of 29 per cent over 374 quarts in 1916.

While in 1916 the average sumption of dairy products equivalent to two pints of milk for 100 million people, in 1926 it 2.6 pints daily for 117 million pe This is an increase of over a gla milk a day for each of the 117 mi persons in the United States, there are nearly 17 million more ple than there were ten years ago

Increase in Value

Milk production has increased only in volume but in value and in the centage it bears to value at the farm o animal products the value of crops fed to farm animals.

The farm value milk, as shown in T III on the next page, increased a third billion dollars since or 13½ per cent in years. In 1919 it plied 15 per cent of value of all agricult production, increa this to 23 per cen 1926. If to the valu milk were added meat value supplie dairy cattle, we these percentages s what increased. As example, in 1926 w timate the values c than milk supplie the dairy cow to be million dollars, ma her total contribu amount to 26 per ce the total value of farm produc last year.

DAIRYING THE BIGGEST DEPARTMENT OF AGRICULTURE

It is a matter of satisfaction to the dairy farmer and evidence of his efficiency that this increased consumption has been supplied with fewer cows and with consequent better profits to the producers. Production per cow, even using the most conservative figures, has increased from 3,700 lbs. in 1916 to 4,700 lbs. in 1926, or a 27% increase per cow. At

*The balance of stocks shows the relation of stocks of dairy products (in terms of milk) on hand at the end of the year as compared with the beginning.

†The balance of foreign trade shows whether there was a net import or export of dairy products in terms of milk.

‡Average consumption of dairy products given in terms of the milk equivalent of the milk, butter, cheese, etc., consumed by each person in the United States.

Farm Production in 1926

The U. S. Department of Agru ture has prepared the following mates of the farm value of agru tural production in 1925 and 1926

Table II—Value of Farm Production in and 1926

Product	Value in mi of dollar 1925	2
Animal products:		
Cattle raised	$ 919	$
Swine raised	1,437	
Other animals raised	136	
Dairy products	2,746	
Poultry products	1,117	
Other animal products	112	
Total animal products	$ 6,647	$
Crops:		
Corn	$2,039	$
Wheat	987	
Other cereals	891	
Cotton	1,799	
Flax	50	
Fruit	668	
Hay and forage	1,471	
Legume seeds	130	
Seeds for planting	38	
Sugar crops	108	
Tobacco	234	
Vegetable crops	1,288	
Other crops	467	
Total crops	$10,170	$
Total crops and animal products	$16,817	$1
Crops fed to animals	3,783	
Total net production	$13,034	$1

*Six ciphers, 000,000, omitted.

The Dairy Cow Contribution

In the above estimates the dairy cow is not credited directly with

ier contributions to the farm value agricultural production. In order make a proper comparison we have de the following estimates based on best information available from figures issued by the U. S. Detment of Agriculture:

	Value in millions of dollars 1925	1926
ry products	$2,746	$2,952
ry veals	68	74
eased value of dairy cows	131	92
ry cows slaughtered	172	176
ry bulls slaughtered	19	19
otal	$3,136	$3,313

These figures do not include the led value of dairy cattle under two irs or the fertility values supplied the soil in the manure of the dairy v. Without these, however, the to- credit to the dairy cow in 1926 is irly three and one-third billion dols, or 25.5% of the thirteen bil- n dollars value of farm production past year.

le III—Yearly Value of Farm Products and of Milk Compared

	Total value all farm products*	Farm value of milk† Value	Per cent of total
	$17,684,000,000	$2,600,000,000	15
	14,545,000,000	2,885,000,000	20
	10,220,000,000	2,217,000,000	22
	10,192,000,000	2,097,000,000	21
	12,344,000,000	2,652,000,000	22
	12,219,000,000	2,586,000,000	21
	13,034,000,000	2,747,000,000	21
	12,985,000,000	2,952,000,000	23

Value at the farm of all animal products crops not fed to farm animals.
Does not include meat value contributed otal by dairy cattle.

Value Per Hundred

The estimated value of milk is at rate of $2.48 a hundred for 1926, ich is higher than for any year cept 1919 and 1920.

Starting with 1919 the farm value milk per hundredweight was estimated at $2.89, increasing to $3.22 in 1920, decreasing to $2.24 in 1921 and to $2.04 in the low year of 1922. It rose again in 1923 to $2.42, only to drop back to $2.25 in 1924, and then rise again to $2.36 in 1925 and to $2.48 in 1926.

§200 pounds per calf, and number of calves estimated at 85% of total dairy cows.

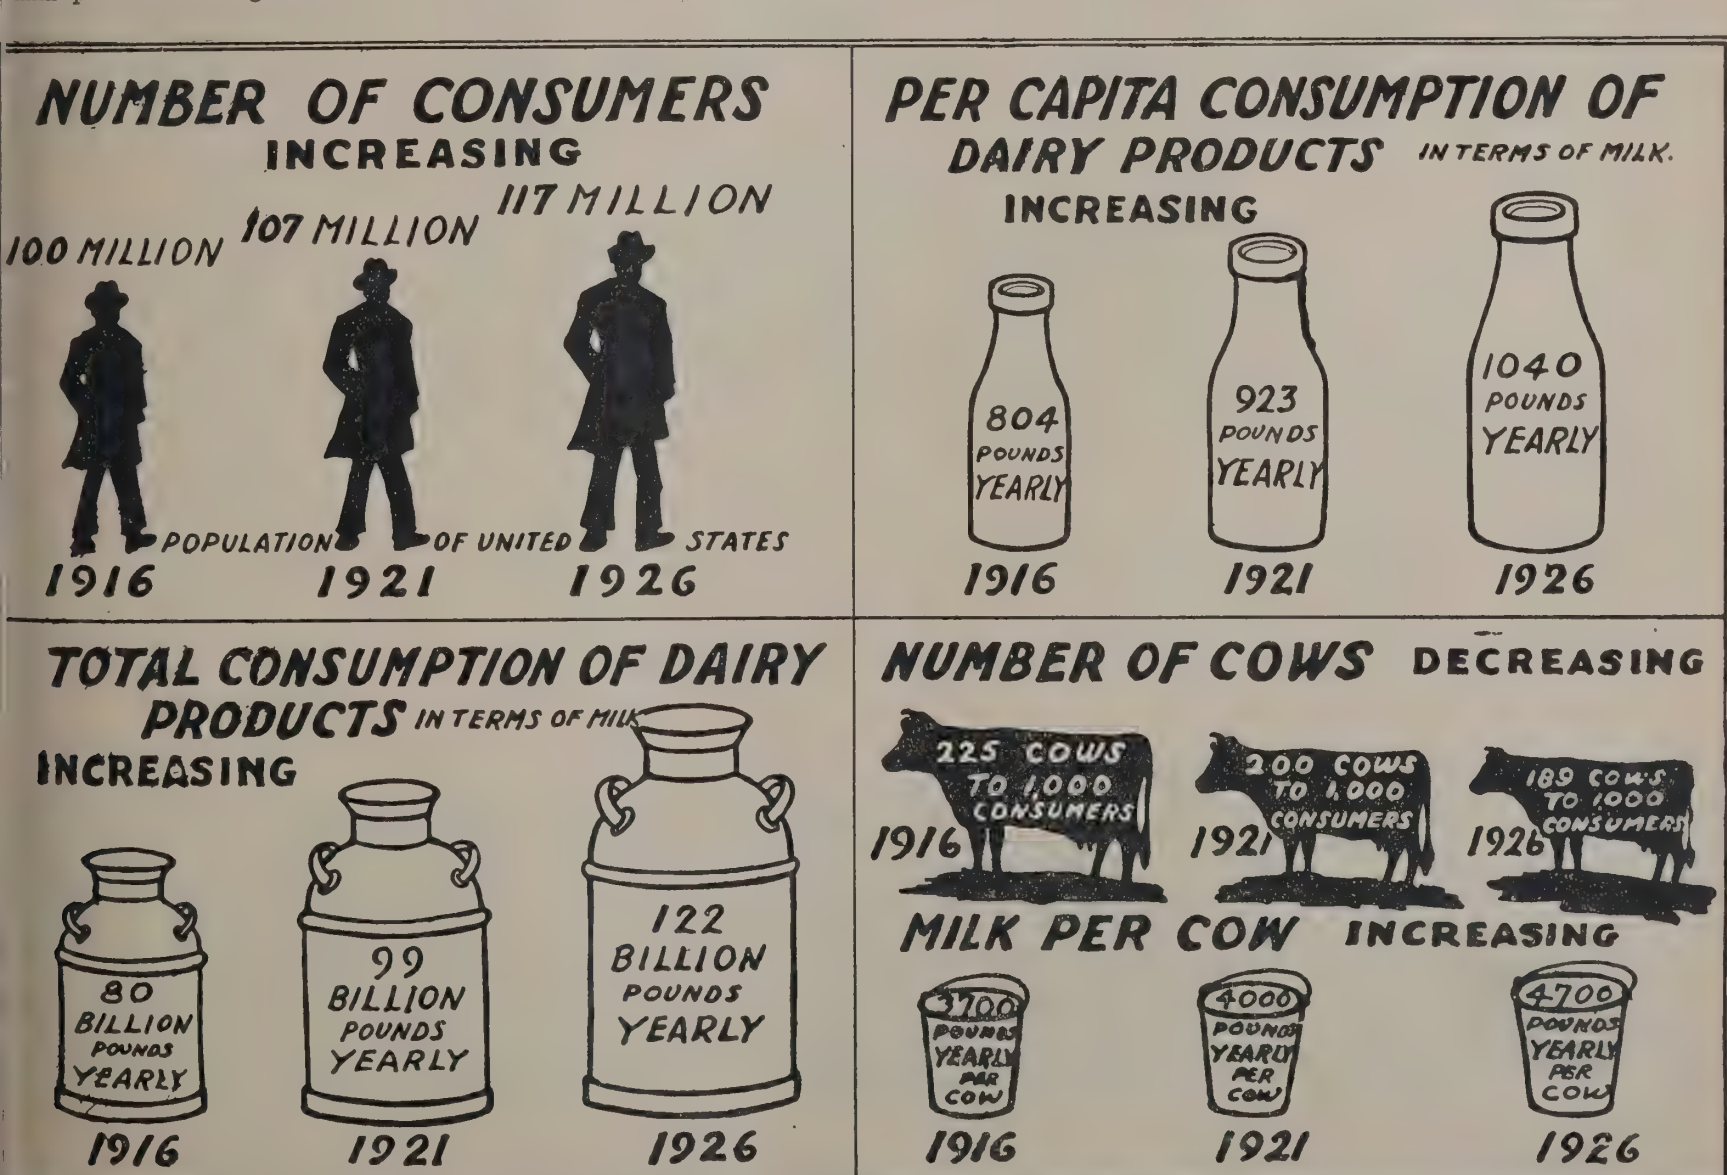
Production Per Cow Increasing

The total production of milk in 1925 represents the annual production of 23,186,000 cows. This would give an apparent average production of 5,208 lbs. per cow as shown in table IV. It is believed, however, that this is greater than the actual production per cow and we have therefore reduced this by ten per cent in preparing the previous comments and in the composition of the accompanying illustration as to the increased production per cow. Even when making this reduction for 1926, we still find the average production per cow to be 1,000 lbs. per cow greater than it was ten years ago.

We would call attention to the facts disclosed in table IV that we have increased the total production of milk by 48 per cent over ten years ago despite the fewer number of cows, both as to total numbers and as to the number of cows per 1,000 people.

The milk production per cow as given in table IV is based on the average number of milk cows on farms at the beginning and end of the year, plus the number of milk cows not on farms that are estimated at 1,200,000 for the years 1920 to 1926.

Table IV—Production Statistics



Year	Milk cows on farms Jan. 1	Ave. milk per cow*	Total milk produced	Farm cows per 1,000 people
		Lbs.	Lbs.	
1840	4,837,000			287
1850	6,385,000			278
1860	8,586,000			276
1870	8,935,000			234
1880	12,443,000			251

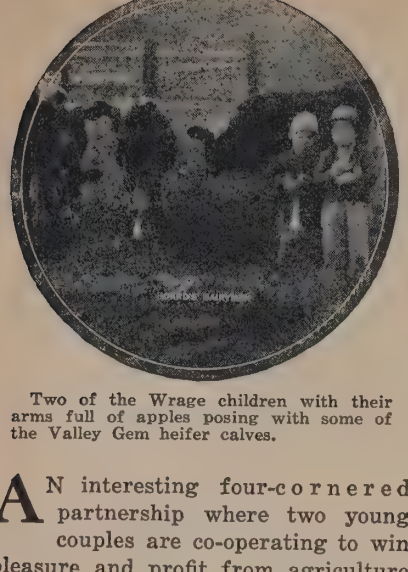
1925	22,481,000	4,954	116,505,000,000	195
1926	22,148,000	5,208	120,766,000,000	189

Per Capita Consumption of Dairy Products



The consumption of dairy products in terms of milk has increased from 380 quarts per capita in 1917 to 484 quarts in 1926, or a 27 per cent increase in the past nine years. A very large proportion of this increase has come through the increased consumption of fluid milk. The per capita consumption of fluid milk in 1926 was 55.3 gallons for every man, woman, and child in the United States. This is an increase of more than two quarts of fluid milk per capita over 1925 and an increase of 51 quarts, or 30 per cent, over 1917, the first year for which data are available.

Butter consumption increased to 17.82 lbs. per capita in 1926, which is a half pound over 1925 and 3.2 lbs. over 1917. While this represents an increase for the past nine years of the equivalent of 31 quarts of milk per capita, yet this is an increase that is more apparent than real. Twenty-five years ago the per capita consumption of butter was nearly 20 lbs., and it is a problem for the future how we may again regain this consumption.

(Continued on page 966)

THE PROGRESS OF THE GREAT DAIRY INDUSTRY IN EXPANDING ITS MARKETS AND INCREASING ITS EFFICIENCY IS SHOWN ABOVE. PRODUCTION AND CONSUMPTION OF DAIRY PRODUCTS HAVE INCREASED 51 PER CENT WHILE THE NUMBER OF COWS PER THOUSAND CONSUMERS HAS DECREASED 16 PER CENT.

Four Cornered Partnership

Success Due to Understanding, Watchfulness, and Industry

GUY A. PETERSON, WISCONSIN

This tall dead cedar will furnish enou posts to fence the entire Valley Gem Fa when it is cut.

AN interesting four-cornered partnership where two young couples are co-operating to win pleasure and profit from agriculture may be found on the Valley Gem Farm, State of Washington. Here the especial talents of each member of the farm corporation are allowed free play. The land is owned by John Wrage's mother, but the farm enterprise is run by the son and his wife and by Mr. and Mrs. C. H. Grewe.

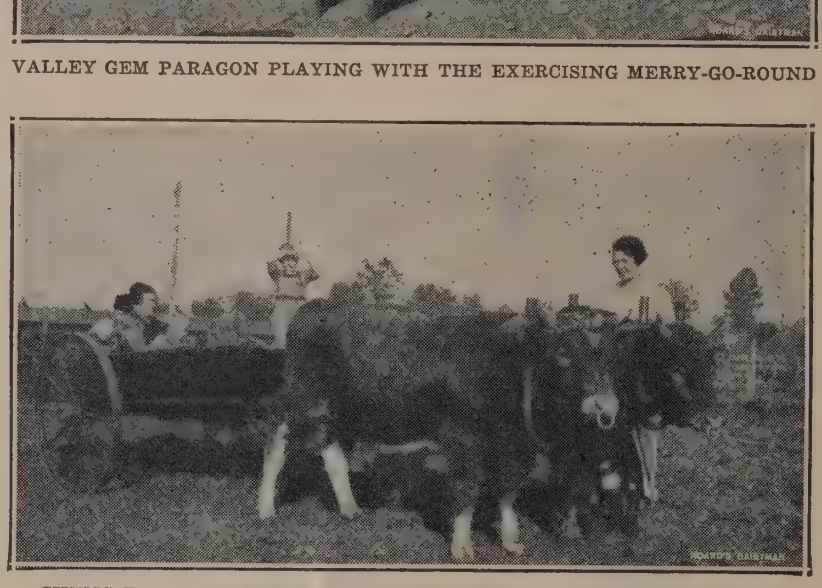
Mrs. Wrage does the milking on this successful farm. Her husband superintends the pure-bred hog business. "Charley" Grewe cares for the poultry department, and his wife takes care of the children for both families when Mrs. Wrage is working with the herd.

A Well Loved Herd

Neighbors the county over will tell you that the success of the dairy is due to the watchful eye and expert care that Mrs. John Wrage gives to the beautiful herd of pure-bred Guernseys as she milks them night and morning with a machine and directs their feeding with daily production and individual characteristics as the guides for the amount of concentrates to be fed.

Mrs. Wrage was just putting the milking machine together in preparation for the evening chores one rainy evening last October as we drove into the yard. Absolute cleanliness is the first law of dairying with her. The barn is whitewashed twice a year. Live steam is used to sterilize every utensil and bottle. A water cooler takes the body heat from the milk as soon as it is drawn from the cow. Each cow's udder is washed before milking and the entire herd is kept scrupulously clean with clippers and curry combs. By the use of these simple tactics she has kept the bacteria count so low that few certified dairies can equal it. Sometimes as few as 250 bacteria per cubic centimeter have been found in this milk by the Seattle inspectors.

Forty Years of Herd Building



Mrs. Wrage loves cows. Everyone in the herd is her pet. That in a nutshell explains many of the commendable things that can be said about the production records of the herd. When the Snohomish Cow Testing Association, the oldest active association in Washington, was started in 1911, the Valley Gem herd was tested for the first time. The average that year was 281 pounds. Then for five years the association had no tester. It was reorganized in 1917, however, and has been active ever since with the Valley Gem herd often leading in production. The butterfat per cow averages from 1917 on for this herd were 301, 358, 382, 383, 412, 475, 483, 390, and 371.

The high average of 483 pounds per cow was made just before the last 10 grade Guernseys with a 591-pound average production were sold. Mrs. Wrage is now milking nothing but pure-breds and she hopes to get as good or even better records from them after a few years.

The fact that the grade herd averaged higher than the pure-bred is not a condemnation of pure-breds, for as John Wrage said: "If dad had started out with pure-breds and had bred for production year after year as he did with the cows he had, there is no reason why pure-breds would not have made equally good records. The ten grade cows that average 591 pounds represented the cream forty years of herd building."

GIVING THE YOUNGSTERS A RIDE, WITH MRS. WRAGE AT THE HELM

Farm Has Interesting History

Perhaps it may be well at this p to give a history of the farm as J Wrage told it to us, for in a way history is similar to that of m pioneer farms that have been cut of the damp wooded wilderness Western Washington and Ore "Dad took up the place in 1880," said, "when he first settled in country after emigrating from many. He packed a stove on his b for a distance of 18 miles ove blazed trail to get it to this fa Most of the pioneer household clearing necessities were car through the woods on his back in same way. About 70 acres of the that he took up was swamp land covered with water. There were th trees on the place that were n than 14 feet in diameter 10 feet ab the ground, but in those days fa ers looked upon trees as somethin get rid of, so they burned even big, beautiful cedars.

"Dad cleared about a third of place before I got old enough to h but I helped clear more than hal it as I got big enough to work. Th were no clay tile in these parts f years ago so dad used split cedar make drainage boxes. He laid th sands of feet of this and it is so l that we can stop up the drains to sub-irrigation if we ever encounte drouth.

Has Fight With Beavers

"Dad and mother almost had leave the place once because t couldn't rid their farm of beavs. These animals caused a great deal trouble with the drainage system they multiplied so rapidly that fat almost gave up hope of eradicat them. One year though he frighte them by hanging up a bright red c oil can until the high waters ca after which he finally trapped th out.

"Dad's whole ambition was to m a wonderful farm. He started with scrub stock because that was anyone had in those days, but he one of the first in the country to a pure-bred sire. He built the sec silo in the county at a time wh farmers around here didn't p

CAUSE, CURE, AND PREVENTION OF DEPRAVED APPETITE

OR several years farmers in certain sections of Western Minnesota have been having serious fficulty in getting normal growth, production, and milk production om their cattle. The condition was lled to the attention of the Univer- y of Minnesota Agricultural Experiment Station staff by the numer- s inquiries that came in asking out the cause of the condition and r a remedy.

In 1923 the station made an investigation in the areas affected and om this and a study of published ports of other investigators, anned some experimental work th a view to determining the spe- ic cause and of finding a remedy. ne work was carried on under the rection of C. H. Eckles, R. B. Beck- , and L. S. Palmer.

The symptoms shown by cattle in ese areas, a brief statement of ch experiment conducted, together th the conclusions of those in arge, are of interest to dairymen. ne most common symptom reported depraved appetite nich is often exhibited an extreme form. The mer usually first notes a desire on the rt of his cattle to ew bones, later the nimals gnaw wood, ten to such an extent at the mangers in the rn have to be replaced the spring. Fence sts of soft woods are most devoured. Anils chew leather and t dirt. Losses are not common from animals tempting to swallow ch material as slate or all rocks. Next to abrmal appetite the st marked symptom is ffness of the joints, ten so severe that the imal walks with great fficulty. Broken bones e sometimes observed t are by no means mmon. Owners state at affected animals se their appetite, dene in weight, and rink in milk. Testiony is uniformly to e effect that heavy ilking cows and growg animals are affected st severely. Bulls and y cows having little re than the requirents of maintenance to eet are affected less serely, or may show no sible symptoms of mineral shortge. Cows affected while in milk tend recover during the dry period.

Considerable trouble was reported th breeding, but no more than the ual amount of abortion seemed in idence. On many farms a cow is t expected to produce a calf more an once in two years. Heifers metimes do not breed until they e past two years old. The average lf crop in the worst affected dis- ict, as observed following a dry sea- n, was estimated at less than 50 r cent of the normal. The trouble reported as occurring more severe- during the late winter and early ring, especially following dry sea- ns. The cattle usually recover dur- g the pasture season and are, as a le, about normal again by fall. ature cows brought into the affected area from regions where the trouble is not prevalent do not exhibit the abnormal appetite until they have lived in the district at least a year.

Many farmers in the newly settled parts of the affected area point to wild hay as the source of the trouble. Many of them depend largely upon wild hay, straw, and corn stover as feed for their cattle during the winter. Some of the affected herds receive little or no grain. The information secured indicated that less trouble was experienced when legume hay was fed in place of the more commonly used prairie hay, but the use of home-grown alfalfa by no means insured freedom from the trouble. In fact, one herd showing especially severe symptoms, including broken bones, received alfalfa hay regularly.

Cattle were observed by the authors on some farms that showed decided symptoms after having been on pasture all summer. Visits made in the spring indicated that the description of conditions as given by cattle owners was by no means overdrawn. In one case investigated some members of a dairy herd had died from broken bones. One cow, unable to get up, was killed by the station veterinarian and found to have a broken pelvic arch. A few cases of crooked legs were observed; also some animals in which movement of the joints was accompanied by noise which could be heard distinctly at a distance of 20 feet.

Cattle grown in these areas are decidedly stunted in size and when mature their heads appear too large for the body. Animals four years of age, on some farms, weigh less than 600 lbs. as compared to a normal of 1,000 to 1,100 for animals of similar age and breeding. It was also observed that cattle on farms where the trouble prevails at times were listless and not inclined to move about, even though no positive symptoms of mineral deficiency were noticed. It was evident from conditions as seen on the farms that serious financial losses are experienced through lack of proper growth, depreciated value of the carcass due to poor fattening, lower milk yields, and a poor calf crop. The trouble is especially detrimental to the dairy cow, but interferes also with beef production.

Representatives of the live stock market at South St. Paul are responsible for the statement that the quality of cattle coming to market from the counties where this trouble was studied is especially inferior.

The first experiment conducted was that of determining the efficiency of bone meal as a cure and as a preventive of depraved appetite. With the co-operation of herd owners, six typically affected herds in the mineral deficient area were used in this trial.

The second experiment was conducted at the experiment station to determine if depraved appetite could be produced among cattle from the affected regions, but not at the time showing symptoms, by the use of feeds grown on farms where trouble regularly occurred during the winter season.

After positive results were obtained from the animals used in the second experiment, mineral supplements were added to the basal ration. Other cattle from the affected areas showing extreme but typical symptoms were treated in like manner.

The conclusions of those having charge of this work are as follows:

Conclusions

The chief cause of the condition is a lack of phosphorus in the roughages fed due to the low phosphorus content of the soil. The farm practice in the affected regions of depending too much on a ration composed largely of roughages for rapidly growing animals and lactating cows is also a factor. The fact that rapidly growing animals and lactating cows are affected most, that the condition becomes worse in late winter, and that affected animals tend to recover during the summer while on pasture, indicates that the low intensity of ultra-violet light in winter and the lack of green feed may be more or less involved as contributing to the cause of the condition.

The condition can be produced under controlled feeding of rations deficient in phosphorus.

The lack of phosphorus inhibits growth in young animals and reduces milk production in lactating cows though it does not affect the mineral composition of milk.

The data suggest that a lack of phosphorus is the chief cause of the failure of open females to come in heat regularly.

The calcium content of the feeds grown in the affected areas when compared with that of similar feeds grown in unaffected areas, does not indicate that this element is a limiting factor.

The phosphorus content of alfalfa and prairie hays is affected directly by the soil and by the amount of rainfall during the growing season.

The feeding of finely ground sterile bone meal with reasonably good dairy rations and salt will cure and prevent the depraved appetite. The feeding of bone meal or spent boneblack is the most economical method known to cure and prevent the condition. It must be recognized that this is somewhat of a temporary means of controlling the condition and that the application of phosphate fertilizers to pasture and hay lands in affected areas must be made if a more permanent control is to be effected.

A complete report of these experiments will be found in Bulletin 229 of the Minnesota Agricultural Experiment Station, University Farm, St. Paul, Minnesota.

Mishko Shoes are made in toe cap and moccasin styles and also in high lace styles in various heights.

In a famed New England dairy

They save money on work shoes

as well as on their rubbers

ABOUT three years ago Mr. Chaffee, whose photograph appears here, complained that he had to buy shoes too often to suit his pocketbook. A local Ball-Band dealer offered the Mishko Shoe as the solution of his problem. Today, he says:

"I get four times as much wear out of Mishko as I ever got out of any other shoe I ever wore. They are the first shoes I ever wore that never had to be resoled, and boy, that's saying something, because I sure give 'em hard wear. Half the time I'm on the run, over cement sidewalks, across soft, wet ground, up and down stairs, stairs, stairs, and jumping in and out of my wagon, swinging heavy bottle carriers before me. Any shoe sole that can stand that kind of punishment as long as the uppers can, is *some* sole."

Hartford, Connecticut

Mishko Shoes
are a Ball-Band product

It is because of the manner in which they are built and the sound materials used in their construction that Mishko Shoes give the long wear that Mr. Chaffee describes. And they have such *comfort* built into them as you would hardly expect to find in a work shoe.

The sole is an exclusive Ball-Band product. It is tough, flexible and waterproof. The heel is of the same material as the sole. The uppers are grain leather, soft, pliable and very durable. The counter is solid sole leather, with the slip sole running from heel to toe. Seams are double or triple-stitched, with extra strong thread. The tongue and toe cap are grain leather and the full vamp runs to the toe. Sole leather is used for the insole.

Ask your dealer for Mishko Shoes by name and look for the Red Ball trade mark.

New Plan to Market Cream

F. R. FARNHAM, NORTH CAROLINA

ONE of the difficulties confronting many North Carolina farmers who have entertained a desire to sell cream is the long distance from their farms to the creameries. Even though a farmer may desire to start shipping cream, the quantity he has to begin with is small. The expense of purchasing cream cans, together with the time involved in delivering it to the nearest railroad station, the loss or delay in getting the empty cans returned, leads him to decide that the job is too difficult.

For years the marketing of cream in small quantities has been attempted by trying to utilize a method known as the cream route. Many county agents have expended considerable time and effort in organizing these routes, but often due to the small quantity of cream produced by the average farmer who is just starting into the business of milking cows it is found that the cost of operating a cream gathering truck or wagon was excessive. After a few initial rounds, the cream route was abandoned, leaving the farmer to market his cream the best way he could. He usually dropped back to the old system where the farm wife made butter and once each week disposed of it at the country crossroad store, receiving from one-third to one-half less per pound than what creameries were paying, and accepting store goods in payment instead of cash. Here was a real problem to solve in Western North Carolina when the dairy production work was started three years ago, before the county agent and dairy specialist could consistently visit a farmer and ask him to start milking cows. Eventually a plan was worked out and now has been in operation in several counties located in Western North Carolina, which has proven both practical and successful. To substantiate how successful it has operated, the creamery, located at Franklin, made in July over 16,000 lbs. of butter. All of this cream was delivered by the individual farmer to these cream stations. Briefly, the plan used in developing the modified cream assembling station and plan for operation is as follows:

1. The county agent and dairy specialist visit the section of the county where the local crossroad store is buying a fair quantity of home-made butter each week. After making this survey and determining that a surplus of cream is produced, arrangements are then made with a merchant to act as cream station operator. One or two 10-gallon cream receiving cans owned by the creamery are placed at the store. The merchant is paid two cents per pound of butterfat received for his services in weighing and correctly sampling each patron's cream.

2. Then the county agent with the dairy specialist will visit a number of farmers living within a radius of two miles of the cream station and at each farm will explain to the farmer and his wife that a cream receiving station has been established at the store and that cream will be received twice each week, usually on Tuesday and Friday. It is suggested to them that instead of churning they can hand skim the cream and bring it to the cream station on the proper days. All cream must be delivered not later than 2 p. m.

3. When the first cream day arrives, the county agent and dairy specialist should be present at the station to teach the merchant how weigh and sample cream correc and to record the cream recei from each patron. For a few ti the county agent places the can cream in his car and takes it to nearest railroad station and ship to the creamery the same day it collected. After doing this two three times, the quantity of cr will usually increase sufficiently make it easy to get the cream de ered to the railroad station.

4. Arrangements are made w the creamery purchasing the cre to pay once each week. This me that the patrons will be one w back in receiving their cream che and after the first week their cre checks for the previous week's de ery will be handed them as they liver their cream. This system i great stimulation for increasing quantity of cream delivered.

As a direct result of this plan following results have been obtain

1. Farmers who would not l cream shipping cans have been duced to start selling cream to th stations and many small farmers becoming intensive dairymen v probably never would have b otherwise.

2. Where the farmer can see cream weighed and properly samp it eliminates the question in his m about receiving a square deal. T country merchant, who is usually station operator, is a booster for dairy business because his patrons ceive more than he could pay cream on the country butter ba and he finds that they also spen

Batteries that won't die young!

For every make of plant

You can have plenty of lights and plenty of power—all the convenience your light plant was built to give—if *you* give *it* strong dependable Universal "Nu-Seal" Batteries to work with.

Less care—long life

Big sediment space, visible charging gauge, extra thick plates, fewer fillings—all this saves you trouble, insures long life. "Nu-Seals" cost you no more now and much less in the long run.

For EVERY plant

These batteries—the *original* sealed glass cells—are made in every size and capacity for every light plant ever sold!—Yours! Any!

Tuberculin Reactors Should be Branded

HOARD'S DAIRYMAN:—H. Ericksen, dairy inspector for Santa Barbara, California, who in the last three years brought that city from the lowest to the highest in the California

H. Ericksen, Santa Barbara milk inspector, in the city service car that takes him out to help the dairymen produce cleaner milk. Due to Ericksen's efforts, Santa Barbara set a new high score of 97.6 for California cities in the surprise milk scoring contests.

surprise milk scoring contests, would like to see a state law passed requiring all reactors to the tuberculin test to be branded on the jaw or hip. He says the present method of tattooing in the ear is not satisfactory because the tattoo marks are so easily effaced. He believes that branding would be a protection to the dairyman against unscrupulous men who would sell infected cattle.

In California it is lawful to sell a reactor for dairy purposes so some dairymen maintain reacting herds. However, the movement for eradication of tuberculosis is spreading even in this state where the farmer gets neither state nor federal aid when he begins about to clean up his herd. One of the first California cities to pass an ordinance requiring that all milk sold as whole milk be produced by tuberculosis free herds was Santa Barbara. This pertains to pasteurized as well as raw milk and the clean-up campaign has resulted in a great increase in consumption of milk there. When Ericksen took up the milk inspection work in Santa Barbara a little over three years ago, the city was using only 45,000 gallons of whole milk a month. At the end of three years that monthly consumption had been brought up to 75,000 gallons, although there was little increase in population and no decrease in price. This shows that people will buy more milk if they know it is good.

From the figures on milk consumption in Santa Barbara, Ericksen believes that it would pay to get rid of diseased cows purely from the standpoint of increasing the use of milk even though the farmers would get nothing for their diseased animals. To quote him, "Milk consumption will increase only in accordance with public confidence in their local supply. The state of mind of the general public is such that it will not accept pasteurization as a cloak for distribution of milk obtained from infected herds. The facts speak for themselves. Until Santa Barbara passed the ordinance requiring that all her milk supply be produced in tuberculin tested herds there was no increase in the consumption of pasteurized milk during the past three years, while the consumption of raw milk from tested herds increased more than 100 per cent during the same period."

Iowa. PETER GUYSON.

A Tightwad

A farmer man once owned two cows
He fed with equal care,
And one was fat and slick and fine,
A show cow at the fair,
But any time that cow was milked
She had no milk to spare;
The other cow was not so fat,
Her bones were almost bare,
But when the farmer sat him down
He filled his milk pail there.
A butcher came along one day
The first cow went somewhere.
—C. A. GALT.

A kind old gentleman, noticing a small boy carrying a lot of newspapers under his arm, said, "Don't all those papers make you tired, my boy?"

"Naw, I don't read them," the lad replied.

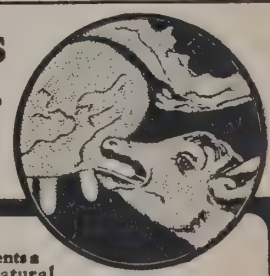
Firestone Dealers

Are Trained and Equipped to—

Save Motorists Money and Serve Them Better

Firestone Dealers have attended Tire Educational Meetings, conducted by factory trained men, throughout the country, and have been shown by means of motion pictures, charts, tire samples and complete engineering data, the details of tire design and construction.

Already almost a thousand of these meetings have been held and they are still in progress—giving Firestone Dealers in every important city and town in the United States the advantage of greater tire information.



Tire Dealers who have such up-to-date knowledge of the construction and care of tires will naturally lead the way in providing the best service stations with facilities to help you get more mileage out of your tires, thus saving you money and serving you better.

The Firestone Dealer receives fresh, clean stocks of Gum-Dipped Tires—and he can also secure Oldfield Tires, designed and built by Firestone, direct from the nearest of 148 Firestone Factory Warehouses. Take advantage of these fine facilities and secure the comfort, safety and economy that only Firestone Gum-Dipped Tires can give you.

The famous Goodyear Pathfinder. Car owners have already bought nearly 5,000,000 of these lower-priced, standard quality Goodyears

Right in Your Home Town

No one in the world enjoys a better tire proposition than is available to you right in your home town.

This proposition is offered you by your local Goodyear dealer.

He sells the world's finest tires at a range of prices to fit any pocketbook, and he *services* those tires after you buy.

He recommends the right size and type of Goodyear Tire for your car. He puts it on the rim for you, fills it with air. He helps you give it the care it should have to deliver maximum results.

When you buy from your Goodyear dealer, therefore, you get a superior tire *which you can see before you buy,* backed up by a handy intelligent service that will save you money.

This service is an important part of the Goodyear policy: *to build the greatest possible value into Goodyear products,* and *to provide facilities so that users can get all this inbuilt value out.*

Goodyear makes a tire to suit *you*—whether you want the incomparable All-Weather Tread Goodyear, the most famous tire in the world, or the lower-priced standard quality Goodyear Pathfinder

HOT WATER IN THE DAIR

E. R. MEACHAM, WISCONSIN

ADEQUATE sterilization is one of the greatest needs on dairy farms today," says Professor G. C. Humphrey of the Wisconsin College of Agriculture.

Some states set forth quite definitely what adequate sterilization means in their dairy laws, but others merely demand that "cans, bottles, or other vessels shall be thoroughly washed and cleansed," leaving each farmer to decide for himself what "thoroughly" means.

But the big city milk companies and some of the condenseries set up a very definite standard by implication. By grading the milk according to its bacteria count, they reward proper cleansing and penalize its neglect very effectively. One of the absolute essentials for keeping the count low is the sterilization of every can or pail that has held milk. Everything must be washed and scrubbed to shining cleanliness, then rendered sterile of milk bacteria by the use of very hot water.

Proper cleansing demands plenty of hot water. Many farmers who have cold water under pressure are still troubled with the problem of getting hot water to the dairy room. If they carry it from the kitchen to the dairy, there is not enough to be effective and it cools on the way.

To the farmer who lives along a power line, the electric water heater offers one way of getting hot water. The convenience and fire safety of this method of heating water are unquestioned. Many farmers feel that these advantages alone justify the cost of electric heating. But where really clean milk commands a premium, hot water helps to increase the income as well.

The simplest form of electric water heater is a specially designed tank that may be connected to the piping of the water system so as to supply hot water at the sink where the cans are washed. If there is no running water in the dairy, the heater may be filled through a large opening in the top, and hot water drawn off through a faucet at the bottom. The electric heating elements are fastened around the outside of the water chamber, and the whole thing is covered with a thick insulating jacket that keeps the heat in.

A heater of this kind has been in use in the dairy room of the Tabbert Farm near Ripon, Wisconsin, for more than two years. Mr. Tabbert fills the tank by hand when he goes t milk. It only takes an hour to the water to boiling so it is a ready for him when he is through ing for the milk. He uses it but a day. The cans are thoro washed and scalded in the mo and rinsed with the warm wate in the tank at night. A separat ter on this tank shows that its age current consumption has be kilowatt hours a month for ten c

Another farmer in Southern consin has a similar heater set i plumbing, so hot water under pre is carried directly to the sink he washes the milk things. This is thermostatically controlled, an temperature is set to heat the hot enough for adequate steriliz He generally has eight cans of m day. The milking machine, the and all of the various utensils have held the milk are washed then rinsed with very hot water a day. The records for this h show an average consumption o kilowatt hours a month.

The proper sterilization afford the hot water, together with me

AN ELECTRIC WATER HEATER WHICH REQUIRES NO ATTENTION AND IS INSTALLED IN THE BARN AT THE ENTRANCE TO THE MILK HOUSE

ical refrigeration that enables hi cool his milk quickly, gets for hi extra 40c a hundred pounds at th cal condensery because his bac count stays below 10,000.

A summary of experiments ma several states indicates that on th erage it will take about 75 kilo hours of electric energy per mon heat the water required in a ten dairy. Naturally the amount of ter used by different men will widely. The temperature to which raised will also affect the cu required.

A heater of ten gallons cap seems to be best adapted to farm ditions. It should be well insulate retain the heat, and it should be trolled by an automatic thermost

This control may be set to mai the water temperature at any p With good insulation the heat lo when no water is drawn, are small, so merely keeping the w hot between washings uses very tle current. The thermostat makes it practical to use a small ing element as there will be no ing for hot water. It never forge turn the current on or off as requ and so protects the heater from b ing out if left empty, and from w ing the current by boiling the w unnecessarily.

For 55 years Ward's Policy has been QUALITY first — then LOW PRICE

WARD'S is a house of Low Prices. Ward's Catalogue always offers *lower than market prices*—it always brings you the largest possible savings. But your Ward's Catalogue offers you more than a saving in price.

When you use your Ward Catalogue, when you order from Ward's, you are certain of the greatest possible value at the price. You are sure of a heaping measure of quality—you are sure of a full dollar's worth of value for every dollar.

We never Sacrifice Quality To Make a Low Price

We do not adulterate or skimp quality, to make a low price. We do not put cheap inner soles in a shoe to take ten cents off the price. We do not save in the weight of an automobile tire to meet low prices made on inferior tires. We try to sell only honest, reliable merchandise,—the kind of goods that will stand your inspection and use.

It is easy to make low prices. It is easy to lower a price five cents or a quarter—*by cutting quality!* It takes vast resources and skill to *maintain quality* and *quote low prices.*

Sixty Million Dollars in Cash Made Possible Ward's Low Prices

Your copy of Ward's Catalogue brings you a saving made possible by buying in the largest possible quantities —and paying cash. Cash always buys cheapest. Goods bought by the dozen cost less than goods bought one at a time. We buy by the car load, by the train load and pay cash to secure low prices for you. Ward's savings are therefore real savings. Ward's maintains quality and secures low prices for you through the vast buying power of eight million customers.

Use your Catalogue Save on Everything You Buy

You may as well have the satisfaction of knowing that everything you buy will prove to be of reliable quality. You may as well get a heaping measure of value for every dollar you spend. And you too may as well save on the price of every article you buy. So use your Catalogue. Take full advantage of the savings and the satisfaction that may just as well be yours.

Your orders are shipped within 24 hours

Your orders will be shipped within 24 hours. That saves time. Besides, one of our seven big stores is near to you. Therefore, your letter reaches us quicker. Your goods go to you quicker. It is quicker and cheaper, and more satisfactory to send all your orders to Ward's.

EDITORIAL COMMENT

WASTING FEED

According to a report of the United States Department of Agriculture, the domestic consumption of cottonseed meal has increased to over two million tons a year, and it is being used for feed and fertilizing purposes. Only 1,000,000 tons were used five years ago.

Cottonseed meal is a most excellent source of protein for dairy cows and it is difficult for us to understand how any system of agriculture can be carried on economically when this good feed is used for fertilizing purposes. We are not producing as much high protein feed as is required to nourish properly our 22,000,000 dairy cows. The low production of many herds can be attributed to the lack of protein and it seems deplorable that a portion of the protein which should go to these cows is put back on the land for fertilizer. This emphasizes the fact that we have by no means solved our agricultural problem and further that it is necessary to grow more legumes both for the sake of the land and our live stock. The land needs more nitrogen and our cows need more protein. The cheapest and best way to provide these elements is by growing legumes. The by-products of our mills are not producing enough high protein feeds to supply all that is needed for our live stock and it seems to us a great waste to use any for fertilizing purposes.

The right practice is to give this high protein feed to live stock, carefully conserve their manure and return it to the land.

OPPORTUNITY

A subscriber writes asking us where he can buy grade Holstein cows capable of producing 12,000 lbs. milk a year and what such cows would cost. We in substance replied that it would be difficult to purchase cows of this capacity. The farmer who owns such cows does not care to sell them. If he would have some for sale, he would probably ask $200 to $250 apiece for them. The dairy farmer who owns good cows but does not belong to a cow testing association might be willing to part with cows of such capacity for less money because he does not know what they were capable of producing.

We find, as year succeeds year, more buyers seek exceptionally high producing cows and are willing to pay good prices for such animals. The demand is far beyond the supply, and there is opportunity for the dairy farmers to produce more such cows and to get their prices for them.

Young men who may be pondering whether they should enter dairy farming or seek some other occupation, may well consider that there are always large opportunities for the man who excels. The person who does but average or below average work has little or no opportunity to make money, no matter what occupation he may follow. Legislation, co-operation, organization will not materially change the income of the average and the below average. There are large opportunities for men in dairying who own herds above the average, and especially those willing to do intelligent work.

STANDARDIZING CHEESE

The National Cheese Institute calls attention to a ruling of the attorney-general of Wisconsin that milk may be standardized for the manufacture of American cheese provided the cheese contains not less than 50 per cent fat in its water-free substance. The Institute declares "that this organization is flatly and unalterably opposed to any move or practice that may result in the lowering of cheese quality standards; that it is the judgment of the board of directors that cheese quality which will find favor with the consuming public is dependent on clean, wholesome milk delivered to a sanitary plant where it is carefully and conscientiously made up into an inviting product containing fat in excess of minimum legal requirements and moisture substantially below the lawful maximum."

It has occurred to us that we have arrived at a time when the standardization of milk is feasible for the manufacture of cheese. This does not mean a lowering of the quality of cheese, providing the courts will enforce the law requiring that cheese contain not more than 38 per cent moisture and not less than 50 per cent fat in the water-free substance. To secure the proper enforcement of the full intent of the law, we would suggest that the section of the law pertaining to cheese standards have added to it the words "all tolerances allowed for."

We believe the quality of Cheddar cheese is impaired when it contains more than 38 per cent of moisture and when it contains less than 50 per cent fat. It is well known that difficulty is encountered in enforcing any arbitrary standard unless the law specifically states that all tolerances are allowed for. It is for this reason we suggest that the Wisconsin standards for governing the manufacture and sale of Cheddar cheese be amended.

A DAIRY PROGRAM

"Your paper is in direct touch with the farmers of the state, and we would appreciate any assistance you can give to make the Congress a success. It would help us materially if you offered suggestions editorially as such suggestions could be a matter of discussion during the meeting."

This is a request made by Gov. Fred R. Zimmerman for our co-operation in building a program for the Wisconsin Farm Congress to be held at Madison, Wisconsin, October 13 and 14. We are pleased to meet a request of this kind, for all our efforts are devoted to advocating ways and means to improve agricultural conditions and to make dairy farming more profitable.

Something over a year ago we outlined the following program for all dairy farmers throughout the United States, and it is particularly adapted to Wisconsin now as it was then:

Eliminate the low producing cows and feed and care for the good cows better.

Increase the use of well bred pure-bred bulls.

Raise more legumes so less feed need be purchased and the productivity of the land increased.

Extend dairy co-operatives for manufacturing and marketing dairy products and to take care of seasonable surpluses.

Educate the consumer concerning the food value and importance of milk and its products.

Let all dairy farmers pledge themselves to eat their own products and refrain from purchasing so-called substitutes.

Improve the quality of milk, butter, and cheese.

Establish larger units of co-operative manufacture, particularly cheese, to the end that there may be higher efficiency and improved quality in the finished product.

Establish grades and standards making them effective by making payment according to quality.

Build up a higher *esprit de corps* within the industry and greater co-operation between its various units.

Lend assistance to a more equitable distribution of wealth, thus equalizing and extending the purchasing power of the consumer.

Readjust farm taxation.

Discontinue bringing new land under cultivation. Reforest the millions of acres that now produce nothing or are being farmed at a loss.

Increase use of machinery to take drudgery out of dairy work and to lower cost of production.

Enact such legislation as will not break down personal initiative and responsibility, but will fulfill the Roosevelt definition of providing rules for the game and an umpire to see that the game is played fairly and squarely.

Finally, the building of better homes and better farm life through the development of better profits by means of better cows better fed and the product of better quality better sold.

There may be methods and plans of proced which would create more enthusiasm and also c ate a more popular appeal, but we know that suggestions which we have made are fundamen to a profitable dairy industry and that they possible of execution.

NEGLECTED OPPORTUNITY

The California Dairy Council, an active agent furthering the consumption of dairy products, cured the services of Dr. E. V. McCollum of Jo Hopkins University to give a series of lectu on the subject of human nutrition. In report Dr. McCollum's talks the Council in part said:

"The dairy industry got some blunt opini from Dr. E. V. McCollum, the man upon wh work is based what is now known of vitamins the newer knowledge of nutrition. Science has en much to the dairy industry and received littl return. When he began his research work twe years ago he had no more interest in dairy p ucts than in any other and was not aware milk possessed unusual virtues as a food. But y of work by Dr. McCollum and other scientists closed that milk products and leafy vegetables the best foods of all for making up any deficie in the human diet."

It is evident to us Dr. McCollum feels that dairy industry has not made use of its large portunities and of the work done by interested ties, for he continues: "Without any effort on y own part, you have been presented with an ad tising feature such as no business ever had bef or will have again. What have you done with opportunity?"

The dairy industry as a whole may well be barrassed by the question propounded by Dr. Collum. We have not had a sufficient numbe leaders to see the tremendous opportunity for thering the industry through the work done by splendid friend of dairy products. On the o hand, we can point with some pride to our ac plishments. Several state dairy councils and National Dairy Council and other agencies de themselves to informing people of the nece and food value of dairy products. Dr. McCo need not feel discouraged even though the wo not going forward as fast as it should. We remember the dairy industry is not concentrat the hands of a few but made up of thousan human beings, and these require education b they can act effectively together.

One of the reasons why we believe so mu getting the dairy farmer and all other dairy in tries well organized is that we may make effe use of the research work done by Dr. McCo and other scientists who have found that milk dairy products are our most important foods.

SELLING FEEDS

Many comments have come to us concer our editorial entitled "Selling Feeds," which an attempt to get the dairy farmer to see tha cows are markets and that they are paying va prices for feeds.

It is well understood that the grain elevato town that will pay the most for grain will b most largely patronized by the farmers. showed that a cow that produced 150 lbs. fat year returned $21.70 a ton for grain, whil cow producing 200 lbs. fat in a year would $48.94 a ton for grain, and a cow that pro from 300 to 350 lbs. would return $90.42 for her grain consumed.

It has been suggested that our illustration have been carried farther by using herds r than a single cow. In answer to this, it m said that the range of production of the mentioned applies equally well to whole

have herds of cows kept for dairy purposes t produce less than 150 lbs. fat and we have ds that will produce more than 350 lbs. In t, some herds run to 500 lbs. of fat, so the il-tration that we used to show the different re-ns for feed consumed by cows producing vari-s quantities of fat is equally applicable to herds. would have been just as well if we would have d the word "herd" instead of "cow." The in-ased returns of the herd producing from 300 350 lbs. of fat are so much larger than the herd ducing from 100 to 200 lbs. of fat that the re-ts are staggering.

It is the purpose of Hoard's Dairyman to get its ders to see these things that they may materi-y increase their profits, for we know if all dairy mers would keep high producing cows that their fits would be increased millions of dollars. We not need greater total production of dairy ducts but we do need more herds that will pro-e 300 lbs. of fat.

Equipment for Retail Milk Dealer

What equipment would you recommend for shing bottles and bottling about 500 quarts milk day?

Valcour, N. Y. J. G.

Mr. C. E. Clement, of the United States Bureau Dairy Industry, sends us the following reply to s inquiry:

"For this amount of milk, I would recommend:

(1) A wash sink with brush run by steam bine with arrangement for rinsing the bottles l also for steaming them.

(2) A small bottler which will fill four bottles a time.

(3) The bottles could be capped by hand, but would recommend an automatic single bottle per.

(4) A steam boiler—about 10 H. P.

This equipment should be obtained for from 0 to $600. He would also need a sink for wash-the cans with steam jet arrangement for aming them. I assume he does not wish to in-ll equipment for pasteurizing."

Calf Clubs Promote Pure-breds

The Middlesex County, Connecticut, dairy calf b of 21 members now owns 55 pure-bred ani-ls while their parents own 51 pure-breds, mak-a total of 106. This is an increase of 96 pure-ds on these same farms since June, 1923. Some e ago the average production of the club boys' ds was 7,762 lbs. milk per cow.

The club was organized in 1923 after a club ry judging team went from Middlesex County the National Dairy Show in 1922. The more boys looked at the show stock there, the onger their liking for it grew. Presently they ided they would like to make a venture in the e-bred line themselves. Back at home their ents and friends favored the idea and the lowing June the Middlesex County Pure-bred ifer Club organization was completed. Thir-n pure-bred tested bred heifers were purchased l brought into the county. They went to 11 erent farms and on eight of these the club r became owner of the first pure-bred there.—R. WINTERS.

Barley Straw for Cows

As I had a light hay crop this year, I would like feed some barley straw. The barley was also a ht crop and it contained a good deal of pigeon ss and red top. Will the barley beards dangerous? Would it be better to feed the aw to horses or cattle?

Northfield, Minn. R. G. W.

There is little danger in feeding barley straw to e stock. Barley beards occasionally accumulate der the tongue or at the side of the cheeks, and s may cause sore month. However, these may easily removed and the trouble will disappear.

Straw is not a good feed for milk cows, except it may provide variety that will make the ration re palatable and secure a larger consumption of d. It should not be relied upon to furnish any d or to replace any portion of the ration. Used rely as an appetizer or to supply bulk to the ra-n, it may be fed to milk cows, but the danger is t the feeder will rely on it to supply nutrients milk production.

The digestion of straw requires about as much ergy as the straw contains in feeding value. This digestion releases heat that will warm the body, and for this reason is particularly suited as a portion of the winter feed for horses not at hard work and for cattle that are being "wintered over." Straw provides little or no nutrients for milk production. The properly fed milk cow releases considerable heat in digesting her regular ration and does not need the "heat value" of straw.

Good straw, particularly from oats and barley, is a good feed for horses not at work. We fed oat straw to our horses in winter together with a little grain, and have found it highly satisfactory. Since we started seeding sweet clover with our oats, the straw is even better relished. Indeed, this combination is some disadvantage as we find our calves are inclined to eat up their "bedding," with the result that we sometimes have to bed them down the second time.

Milking Machine Questions

Is there any distinct advantage or disadvantage of milkers using both pressure and suction over those using suction alone?

Have machines using alternating action any particular advantage or disadvantage over those working all four teats at one time?

Does the amount of suction or vacuum used have any effect on the cow either while milking or deferred effect? I notice quite a wide variation in this point in different machines.

Eureka, Illinois. J. F. F.

The milking machine has been in use for a sufficient number of years to warrant the very definite conclusion that it offers a very satisfactory method of milking as well as removes one of the chores that is considered disagreeable on many dairy farms. Like any mechanical equipment, it will not perform the impossible and it requires reasonable care and knowledge on the part of the operator as to its limitations as a mechanical instrument in noting the condition of the cow. It must be kept in repair if it is to continue to operate successfully. Perhaps the one point on which most men have fallen down is that they have failed to keep the machine clean and in good working order. Too many men have assumed that any kind of care and attention to the cleanliness of the machine was wasting time, whereas this is essential if a good grade of milk is to be produced. This does not mean that this is difficult work or that it takes a large amount of time, but it is just one of those small everyday details that too often escapes the attention that is required.

The particular questions asked are to some degree a matter of controversy and it is possible that there is, perhaps, no manufacturer who will not say that his machine is superior to all others. If he produces the alternating type of milking machine he will probably insist that this is the best, and likewise as other points in which the operation and mechanism of the machines differ. So far as we know there have been no adequate competitive trials to definitely determine what make of machine or what type of machine is superior to all others. It is probable with this as with most other machines—one type of machine will be preferred by one man while another type will be preferred by another, and both will assert from their own experience that their particular type of machine is best.

The specific questions asked have been referred to Professor C. Larsen of South Dakota, who replies as follows:

"Practically all of the milking machines employ the same amount of vacuum or suction, and very few of the machines employ pressure. The pressure that is applied in some machines is very slight. If this pressure is controlled, in some cows it would work out to the advantage of the machine, especially in connection with holding the teat cups on, and secondly, would also permit more of a complete release without having the cups fall off entirely.

"My personal opinion is that there is no particular advantage gained with alternate action over milking all four quarters at one time. The rapidity of suction stroke is about the same. The alternate idea follows up hand milking. From the standpoint of the cow, I can see no difference in the two types of machines, and from the standpoint of the mechanism of the machine, one type works as well as the other.

"The amount of suction or vacuum used during milking, without question has considerable effect while milking, but the greatest effect is on the cow after the milking is completed.

"If the suction or vacuum is too great, easy milking cows will be milked out quickly, providing the machine releases and milking goes on normally. If the milking machine does not give intermittent release and the milk is not drawn normally, then the greater suction is likely to cause the circulation in the teat to be retarded and it may ever be stopped to such an extent as to injure the cow and cause swollen teats which become hard and sore at the end, especially if this kind of machine-milking is repeated.

"If the machine employing high vacuum milks normally, then the milk will be drawn rapidly; in fact, more rapidly than the cow can release or give it down. In other words, the drawing of the milk is more rapid than the cow can give it down, and, therefore, a good share of the suction is on the inner udder tissue rather than on the milk. This often causes the cow to hold up all of the milk. A machine should not draw the milk any faster than the cow can release it.

"In addition, if a milking machine employing high pressure is left on the cow too long after the cow is milked dry, the suction on the internal tissue may prove to be harmful. There are some hard milking cows which require rather high suction. Generally speaking, the lower the suction that a machine will operate and draw the milk from the cow, the better it is for the cow."

These questions were also referred to a research engineer connected with one of the milking machines in use, and we believe he has given an unbiased and reasonable reply, as follows:

"A number of machines use vacuum and atmospheric pressure alternately. That is, the space between the liner and the wall of the teat cup is alternately 'filled' with vacuum and atmospheric pressure while vacuum is applied constantly to the inside of the liner. In the one machine vacuum is applied constantly to the inside of the liner while the space between the liner and the teat cup shell is alternately filled with atmospheric air and air actually under pressure.

"When vacuum is applied to the teat for the purpose of drawing out the milk, blood is at the same time drawn down into the lower end of the teat and the purpose of applying pressure to the outside of the liner is to push this blood back up out of the teat, otherwise congestion will result.

"There are only three milkers I think of at the moment that are using alternating action. When we first adopted alternating action we did so with the idea that there would be less danger of having the teat cups drop off, for one pair of cups will always be on the 'suck' while the other pair is on the release. We found, however, somewhat to our surprise, that actual milkometer tests indicated that most cows milked out more freely with the alternating action than with the simultaneous action. Frankly, I suspect this may have been due to the fact that these particular cows probably always had been milked by hand by the 'alternating action' and since cows are emphatically creatures of habit it might be that the alternating action 'felt a little more natural to them.' I am not sure that a heifer that had never been milked any other way would notice any great amount of difference, yet, many milk authorities believe that the act of drawing the milk from one quarter stimulates the secretion of the milk in the adjoining quarter. The fact that you will occasionally run across a cow that will begin to leak from the hind teats the minute the milker starts milking the front teats by hand, or vice versa, may furnish some ground for this belief.

"My observation is that it is not the amount of vacuum but the manner in which it is applied that counts, that is at least within reasonable limits. Our milker will milk the average cow satisfactorily with anywhere between 10" and 20" of vacuum. At 10" it milks a little too slow, with 15" of vacuum it takes the milk away just about as fast as the average cow will release it, so there is no particular object in going much above this. I believe that what holds true with our milker will hold true with any other make of milker using a teat cup so designed that congestion in the point of the teat is entirely avoided by proper massage.

"In one make of milker that I have in mind there is a little weighted control valve in the lid of the pail. This cuts the vacuum something like 2" or 3"; in other words, the amount of vacuum in the teat cup would be a couple of inches less than the amount of vacuum shown by the vacuum gauge.

"We know beyond any question that 15" of vacuum in a properly designed teat cup will cause no immediate or deferred injury. At the University of Missouri it has been customary the past two or three years, during Farmers' Week, to attach our milker to a cow and leave it on her all forenoon, simply to dispel the idea that a modern milker will draw blood if left on too long."

BACK IN THE BARN

....*for another winter*

PASTURE will soon be gone and your cows back in stanchions for another long season of heavy grain feeding.

Milk prices are higher and will be higher still before long.... some of your cows have freshened and are starting off on a new lactation period, milking heavily just now.....a good combination of factors for profits .... the time of all times to feed well, to hit upon the ration you will want to feed all winter.

The protein basis of your ration is the profitable part.

Diamond Corn Gluten Meal

furnishes highly digestible and productive protein economically. DIAMOND has at least 40% crude protein, over 80% total digestible nutrients, and not more than 4% fibre. Compare this analysis with other protein feeds, and then build your ration on DIAMOND this Fall and Winter. It's the logical way to keep your milk checks much higher than your feed bills.

We have several good formulas, showing how to feed DIAMOND with homegrown grains and other feeds. These formulas will be sent to you free. Just write:

AVOID WASHING

Bottles By Hand

Ladd's Pressure Washer

saves several hours of time 365 days each year. The number of hours depends upon the volume of your business.

The handling and washing of each individual bottle takes hours of time that could be saved by the use of a Ladd Washer. You certainly are interested in this. A case of bottles washed, rinsed, and sterilized each 60 seconds is the capacity of Ladd 62nd Washer.

ARE YOU INTERESTED IN PASTEURIZED MILK?

We Recommend Ladd's Complete Outfit, as Follows:

Ladd's Blue Line Pasteurizer, Ladd's Tubular Filter, Ladd's Cooler, Milwaukee Filler and Capper, Ladd's Brine Maker and Ladd's 42nd Washer. *Send for Bulletins Nos. 64 and 575.*

Tunney Trains On Milk

GENE Tunney is a milk-fed champion. In training for his sensational fisticuff with Jack Dempsey on the memorable evening of September 22, 1927, in the gigantic Soldiers' Field stadium at Chicago, Gene Tunney drank "padlocked" milk produced on the Chicago Guernsey Farms. This Golden Guernsey Certified milk was delivered at the Tunney training camp in padlocked, ice-packed cases.

Milk makes champions. Colonel Lindbergh trained on milk for his record smashing flight. Gene Tunney trained on milk for the greatest of all fights in which he defeated Jack Dempsey for the second consecutive time, thereby retaining the title of world's heavyweight champion.

GENE TUNNEY, WORLD'S HEAVYWEIGHT CHAMPION AND FORMER MARINE

We are indebted to Mr. Drew Ten Broeck, manager of Chicago Guernsey Farms, for this photograph which was autographed for him by Mr. Tunney.

News From Washington, D. C.

[Special to Hoard's Dairyman.]

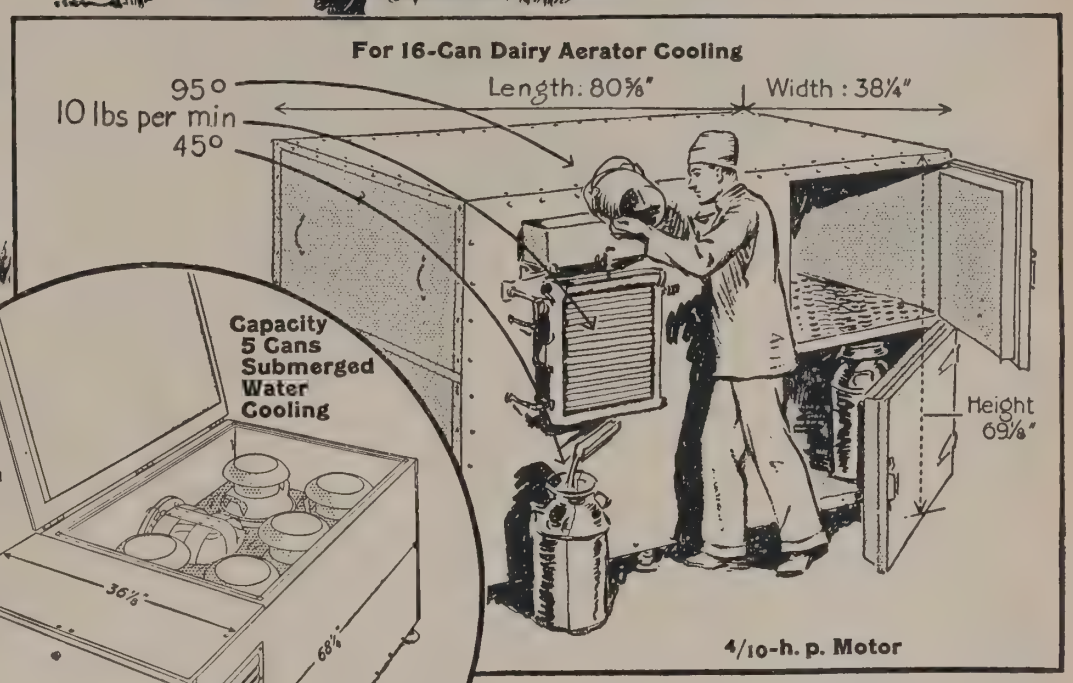
Washington, D. C., Sept. 27—With the final decision announced this week by the President that there is to be no special session of Congress, plans for the winter legislative session have begun to take definite form. This means that Congress will get down to business December 5, and after perfecting the new organization necessary with the convening of a brand new Congress, will find itself faced with such an amount of pressing public business as to necessitate early and almost continuous sessions of both the House and Senate, and the major committees.

Tax legislation to simplify and clarify administrative procedure will be initiated by Ways & Means Committee hearings beginning in October. These will be followed by other hearings on the necessary new tax bill. It is likely that tax reductions will be provided for, but of what character or extent will depend on the hearings to be held. This will be the first business in hand and will be followed by the appropriation bills; these subjects will have legislative right of way.

Appropriation committee hearings will begin perhaps as early as the middle of November. The dairy industry will be concerned with several important appropriation bills: the general agricultural bill, which it is hoped can include about $100,000 for new dairy research; the tuberculosis eradication item in this bill which it is hoped will cover between five and six million dollars for farmers' indemnities; a new item for work on infectious abortion of cattle; and some smaller items for new equipment at the Beltsville station and other dairy experiment stations.

Next after taxation and general supply bills, Congress will take up flood relief, farm relief, railroad legislation, naval policy, immigration, and perhaps the merchant marine problem. Aviation, radio, and tariff are on the docket for some legislative forts, also general foreign affa especially Mexico and Central Ame ca. It is certain—with a president campaign in the making—to be a v interesting and eventful session.

Replies to a questionnaire sent recently by the Washington office the American Dairy Federat throughout the industry as to search problems which were rated of first importance are being stud and tabulated. One surprising facts brought to light, to the effect that practically every group and in nea every state the one problem mentioned in nearly every reply has to with either contagious abortion sterility of dairy cows. There ru through the majority of the answe it is stated, the indication that w increasing production there is a tendency to decrease the reproductive f ulties of the dairy animals. The questionnaire answers show that mu work is being done on this proble but that in particular contagio abortion seems to be a problem as which small progress toward soluti is being made. Various angles of t problem are being worked on in d ferent states, and the U. S. Depa ment of Agriculture is doing a go piece of work but the disease seems be advancing much faster than a progress toward a remedy or cont method.



Your correspondent paid a rece brief visit to the Dairy Experime Station at Beltsville, Md., and fou the farm in good condition, with ve fair crops this year in spite of unfavorable weather conditions. Silo fi ing had just started, the machi having been operated long enough fill one-half of one of the big sil

You Wouldn't Keep Boarder Cows

ur herd must be good producers. t the high production of many od herds is cut down to almost arder proportions by rejections receiving station platforms. ick, efficient and economical oling is as important in milk ndling as good cows, proper using and balanced rations.

zer-Kelvinator Electric Milk Coolers er new opportunities for convenience, nomy and profit. They save time, ney and labor. They bring a guar- tee of better milk with less trouble l expense. No more ice harvesting or rage to worry about. No more re- ted milk at receiving station plat- ms. Easily and quickly cool your lk to the correct temperature and p it there. The greatest dairy ad- ncement since the milker and the arator!

For Large or Small Herds

zer-Kelvinator Coolers are made in o sizes. The larger will handle up to 16 cans by aerator cooling. The smaller is for the production of a 5-can dairy, operating by ice-water submersion.

Exhibiting at the National Dairy and Ice Cream Convention, October 24th to 29th

Nizer-Kelvinator Electric Milk Coolers may be inspected under actual working conditions at the National Dairy and Ice Cream Convention in Cleveland, October 24th to 29th.

Both the large and small coolers will be on exhibition. All dairymen interested in more efficient milk handling should be sure to stop at the Nizer-Kelvinator booth. They will see a revolutionizing advancement in milk cooling. The triumph of practical engineering over old-fashioned, laborious methods.

Practically built—ruggedly built—each will stand a lifetime of wear on the farm. The larger may be used with or without water. The smaller may be operated by a farm lighting system. Easy to clean.

Farm Tested and Approved

These are the first practical electric milk coolers—thoroughly tested and approved under actual farm conditions.

Easy to Own

You can get Nizer-Kelvinator Electric Milk Coolers through your milk dealer or through most Kelvinator Dealers. Ask about them. Or, if you prefer, write direct to any Nizer branch for a complete description.

There are so many entries in the Nizer-Kelvinator name contest that announcement of the winners cannot be made in this issue.

For heavy duty—the power which serves industry is now available to many farms.

Electricity can give the farmer much now—and more later

THE FARMER wants new equipment. His own may be "pretty fair," but a practical sense shows him how much more could be done with better. He wants it; but he first wants to make sure.

Users of farm-electrical equipment today are reporting good results. But the development of electrical machinery for the farm has just begun. Electrical manufacturers, aided by farm organizations and agricultural schools, will continue to make better machinery, improve the old and work out and test new uses for electricity. What discoveries in farm economy may lie ahead!

The electrical industry is bringing all the weight of its industrial experience to the service of the farmer. With its vast system of interconnecting lines, it was never better prepared to serve. The farmer wants not only light but every form of power that will make life on the farm as comfortable and convenient as in the city. A rural civilization will arise, worthy in every way of the farmer's dream.

Groups of farmers who can assure their local power company of a sufficient demand for current to make a new line self-supporting will find the company glad to cooperate. Ask your power company for information.

The Committee on Relation of Electricity to Agriculture is composed of economists and engineers representing the U. S. Departments of Agriculture, Commerce and the Interior, American Farm Bureau Federation, National Grange, American Society of Agricultural Engineers, Individual Plant Manufacturers, General Federation of Women's Clubs, American Home Economics Association, National Association of Farm Equipment Manufacturers, and the National Electric Light Association.

Wayside Musings

"And Seeing the Multitudes"

JOSEPH S. MORRIS, WISCONSIN

JESUS was moved to preach the Sermon on the Mount by his pity and sympathy for the crowd. In the Gospel according to Matthew, the ninth chapter and the thirty-sixth verse, it is said that "when He saw the multitude He was moved with compassion for they were as sheep without a shepherd."

No man or woman may expect to do very much for people until there is developed within them a genuine sympathy, compassion, appreciation of the needs of the people.

"Seeing the multitude" is seeing it with its problems, its burdens, its sorrows, its disappointments and failures, and having heart enough and mind enough out of one's compassion to attempt to do something that will be a real help to people.

What dense populations there are in the nations of the earth today! We talk about populations in terms of millions, in terms of necessary food supplies, in terms of raw materials to supply the material needs of these multitudes. But "man shall not live by bread alone." Man has spiritual needs that are very real and unless his spiritual needs are supplied we may find him discontented though he have an abundance of material things.

The reason the spiritual teachings of Jesus have lived through the centuries may be found in the genuineness of the man himself. People felt and still feel that Jesus was sincerely interested in and concerned with the real needs of people. There was never present the feeling that He was seeking something for Himself. Indeed, so full and rich was His own life in the things that make for rounded manhood, that He had an abundance that could overflow to the blessing of other lives.

Much attention is paid to the outstanding individual, to the man or woman who achieves some distinctive thing. We need not worry but that such men and women will be recognized. There is a danger, however, that we shall fail to see that the ordered life of the world depends upon the multitudes of men and women who "do the day's work," take up their daily burdens, carry on in the education and training of their children, support churches and schools and hospitals and many other worthy enterprises, make civilization and progress and culture possible. Exceptional men or women, in their extraordinary achievement, must always stand upon the shoulders of the multitude. Without the multitude, individual achievement would be meaningless.

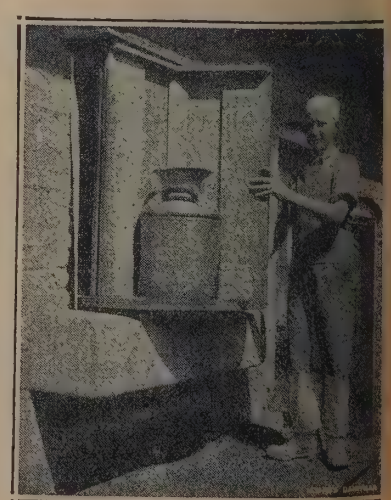
In the plan of the good God, the common people of the world seem able to find joy and peace and contentment in living plain, wholesome, decent lives.

We are forever having our attention pointed to the dangerous tendencies. For a change let us turn our attention to those to whom faithfulness, and loyalty, and painstaking labor are not idle terms. When contentment, a sense of duty and obligation, the desire to play the man, the woman, in a commonsense way, when these die out then and only then would there be any real danger to civilization.

We do not think, of course, that our civilization has reached the peak of perfection. We know that it has not. We also know that the best and most enduring changes come by a slow process. So long as we honestly struggle to make things better, so long as we try to think our way through to the solution of our problems, long as we "hold fast to the thi that are good" while still striving the better, just so long are we on highway to finer things.

It is impossible that we shall al wealthy in the sense of having abundance of money that opens door to untold luxuries. It is a f acy of this age that would stake ev good upon more possessions in m rial things. In the multitudes th are many, many good men and w en who have looked this thing squ ly in the face, have appraised the riches of life, and are going al from day to day in peace and cont ment in the possession of the riches, the riches of mind and he the riches of character. They are " salt of the earth." Let's think of th occasionally.

Day in and day out there are and women toiling in the fields of world, producing the food of world.



Day in and day out there are toiling in laboratories, trying to o come the diseases that attack m kind. There are men striving day ter day to invent and perfect lab saving machinery that will take burden from the shoulders of men.

What does it mean that men women are striving for comple knowledge, for fuller fact and tru men and women who are not held the dead past but are walking into sunrise of a newer and better day?

In a thousand and one places th are men and women giving of th all to the end that human life may richer, freer, happier. Are not th all co-workers together with Eternal Goodness? Need they st before that Eternal Goodness wh character is expressed in ceasel constructive effort, ashamed beca in some instances they were not qu able to express the faith of their li in some formula?

I cannot help but ponder often saying of the Great Teacher: "y their fruits ye shall know them." must be so—in the life of every l man and women the fruitage m prove the character. Faith and wo must forever go together.

When the fruitage of decency, spect for law, cleanliness of life, r erence, respect for womanhood a childhood, frugality, thrift, indus appear in the majority of the mu tude we must conclude that the tional life is, on the whole, good.

Receiving platform at the Farmers' Butter and Cheese Association Plant, Iowa is arranged with three places and swinging partitions to keep out the cold in winter and the flies in summer. Note the frame which is loaded from the outside and the window is shut; when the frame swings to the inside for unloading, the partitions still form a window.

$15,000.00 in cash prizes for a slogan about WOOD

Read the fascinating story of Nature's most friendly and useful material. Know more about its beauty, durability and economy. Learn the truth about America's vast and permanent supply of timber. Then send us your slogan!

This message may mean $5,000 added to your bank account. And remember that these slogan contest prizes are seldom won by professional writers or technical experts. Nearly always the winners are people who never expected to win. So do not skip anything—not one word.

No timber shortage

Almost everyone has been induced to believe that this country is confronted by an acute shortage of timber. This is not true.

In fact, Col. William B. Greeley, U. S. Forester, urges the nation to "Use wood, and conserve the forests." For timber is a *crop*. It needs to be cut when ripe. Failure to do so means *waste*.

There is enough standing timber in the United States today to build a new six-room house for every family in this country, Canada, South America, all of Europe and the entire British Empire! And the *additional* lumber supplied by the *yearly growth* of standing trees would build a continuous row of these houses along both sides of a street reaching from New York to San Francisco.

These are not "opinions"—but *facts* backed up by extensive investigations and published reports of the United States Forest Service.

Better lumber than ever

Not only plenty of lumber—but *better* lumber! Today, *American Lumber Standards*, adopted by the industry and endorsed by the U. S. Government, give the purchaser protection he never had before.

Universal adoption of reliable standards has won for the Lumber Industry high praise from Secretary of Commerce, Herbert Hoover.

Wood built America

Without wood there could have been no America!

Stout wooden ships brought the settlers of America across the wide stretches of the stormy Atlantic. Wood sheltered them in sturdy log cabins and wood housed their descendants in colonial mansions—many of which endure today.

Throughout the Thirteen Colonies wood built the homes, the churches, the town halls, the schools. Wood built the wharves, the warehouses, the stockades, the barns, the corn cribs, the bridges.

Later, the Forty-Niners battled their way over the long cruel trail to California in covered wagons made of wood. On ties of wood the railroads advanced unceasingly, West, East, North and South.

Uses constantly increasing

Twenty years ago there were less than 2600 commercial and industrial uses for wood. Today there are more than 4500. Radio alone uses more lumber than some states use for buildings.

From the staunch timbers in mine shafts to the buoyant strength of Lindbergh's immortal plane, wood serves mankind in countless and ever-increasing ways.

Wood endures

The oldest and most beautiful homes in America are houses built of wood. Many of them stand today, as sound in timber and beam, and *as livable*, as they were before the Revolution.

Wood endures—and the supply is enduring. For it is the only one of our natural resources that *grows*. The mine becomes a gaping hole—the forest forever renews.

Wood is beautiful

Wood possesses a pleasing natural beauty of grain and texture that mellows and deepens with age and defies imitation.

Wood can be fashioned and carved and fitted into thousands of charming designs.

And surely it is significant that the American architect prefers lumber for his own home!

Wood is friendly

Of all materials there is none so *friendly*, with such a sense of human companionship, as wood. Wood is warm and alive to the touch. The handle of a tool, the steering wheel of your car, the arm of your chair, the bowl of your pipe—you like the feel of them because they are wood.

Wood is economical

Wood is stronger, pound for pound, than any other material. It is easily and cheaply fitted to special forms for special needs.

Its moderate cost is due today, in no small measure, to the elimination of waste. There is a grade of lumber for every purpose, a right wood for every need.

* * *

To inspire renewed and greater appreciation of wood, and to make more widely known its almost endless variety of uses, manufacturers of American Standard Lumber in the National Lumber Manufacturers Association are preparing an extensive educational campaign. The first thing the Association wants is a "slogan." Send your coupon *now!*

Subscription Rates

Subscription in United States and Mexico three years for $1.00; single year, thirty-five cents. Canada, three years, $2.50; one year, $1.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $1.00 a year; not in Postal Union $1.50 a year. These rates include postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers who farm with businesslike methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received thirteen days previous to the date of publication. Advertising to be classified or changes in advertising must reach us three weeks previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Nov. 14-19—Pacific Slope Dairy Show, Oakland, Calif.

Nov. 29-30—National Creamery Buttermakers' Association, Nicollet Hotel, Minneapolis, Minn.

A DAY AT FIRESTONE'S

FLOYD S. BARLOW, OHIO

SOME 625 Ohio Guernsey breeders were entertained by Harvey S. Firestone, tire manufacturer, at Harbel Manor, his Akron home, and at Firestone Farms on Thursday, August 18.

Harbel Manor is one of the most beautiful estates in Northeastern Ohio. Luncheon was served in a big tent on the Manor lawn. The Portage Riding Club has its home at Firestone Farm. The cattle barns, horse stables, and riding pavilion attracted the visitors' interest and attention.

Dr. C. H. Case of Akron and his associates demonstrated the short method of the agglutination test for abortion. The doctors recommended the use of the test and the isolation or disposal of reacting animals. When valuable breeding animals react they recommend vaccination of the clean animals each year so long as the reactors are retained.

Wayne Light, the able manager of Firestone Farms, and Banks M. Collings, County Agent of Summit County, conducted a judging contest. The men worked on a class of bulls, the women placed a class of cows, the teams worked on 2-year-olds, and the boys and girls judged a class of heifers.

H. M. Doyle's boys, representing the Wooster high school, won the cup presented to the champion school team by the Firestone Farms. Arlo Mowery, William Winkler, and Homer Billman were the team members. Other contest winners were: J. P. Bennett, men's class; Mrs. Lottie Tschumy, women's class; and Harold Huston, boys' and girls' class. Each winner was presented with a silver engraved Guernsey cream can by the Stark-Portage-Summit Guernsey Association under whose auspices the meeting was held.

A parade of the Firestone exhibition herd took place after luncheon. In response to President M. J. Barker's words of appreciation for the day's entertainment, Mr. Firestone welcomed the visitors and then compared American industrial and agricultural life with other countries, saying that we excelled in both, but that he did not believe that agriculture showed the same degree of supremacy as did industry. He told of a mach in his factory with which four n could make a tire in one minute that their aim was a machine t could make a tire in one minute w one man. He is convinced that far ers should have similar aspiration

Professor S. M. Salisbury of O State University in his talk show how efficient methods of handling a feeding the herd would do the sa for the farmer as industry is doi for itself.

C. W. Robinson of the Americ Guernsey Cattle Club gave some teresting figures on Ohio Guerns progress.

IN THE SPOTLIGHT AT FIRESTONE FARMS GUERNSEY DAY

Left to right: Floyd S. Barlow, secretary Ohio Guernsey Breeders' Association; M. J. Barker, Jr., president Ohio Guernsey Breeders' Association; H. S. Firestone, owner of Harbel Manor and Firestone Farms; and Wayne Light, manager Firestone Farms.
